The yellow oleander of Florida gardens, *T. nereifolia*, is a very ornamental small evergreen shrub, growing luxuriantly in rich sandy soil, not too moist and not too dry, ultimately attaining a height of 6 to 8 feet and almost as much in diameter. The foliage is abundant, light glossy green, and reminds one of the oleander, but the leaves are narrower. The pale yellow flowers are abundantly produced. The fruit, which is of the size and somewhat of the form of a hickory-nut, is regarded as poisonous by the negroes. Thevetia can stand a few degrees of frost. If banked with dry sand in fall it does not suffer to any great extent, although the top may be killed. (H. Nehrling.)

A. Lvs. 8-10 in. long, about 2 in. wide.

nitida, DC. A tender shrub: lvs. oblong-lanceolate, acuminate, margins revolute: fls. rather large; corolla white, with a yellow throat. W. Indies; cult. in S. Calif.

AA. Lvs. 3-6 in. long, less than ½ in. wide.

nereifolia, Juss. Known locally in Fla. as "trumpet-flower" and incorrectly as "yellow oleander." A tender shrub: lvs. linear, shining, margins revolute: fls. about 3 in. long, yellow, fragrant. W. Indies, Mex. B.M. 2309 (as *Cerbera Thevetia*).—Cult. in S. Fla. and S. Calif.

F. TRACY HUBBARD.†

THIBAÛDIA (named for Thiebaud de Berneaud, a French botanist). *Ericaceæ*. Shrubs with the st. sometimes tall-climbing: lvs. alternate, persistent and leathery: fls. in numerous many-flid. axillary racemes, scarlet; calyx 5-lobed or 5-toothed; corolla tubular, contracted at the mouth, 5-lobed; stamens 10; ovary 5-celled: berry small, globose, 5-celled. About 20 species, Trop. Amer. Probably none of the true Thibaudias is common in cult., although the two following species have been grown. *T. floribunda*, HBK., with grayish branches, oblong-lanceolate lvs. and glabrous fls. in solitary raceme. Peru. *T. pichinchensis*, Benth., growing 6-12 ft. high, with lvs. 3-4 in. long and oval-oblong or sub lanceolate and the calyx scurfy-tomentose. Ecuador. *T. acuminata*, Wall., is correctly *Corallobotrys acuminata*, Hook. f. (*Epigynium acuminatum*, Klotzsch). Shrub 2-4 ft. high: branches thick: lvs. alternate, petioled, 5 x 1½ in., sometimes 10 x 2½ in., lanceolate, base cuneate, glabrous: fls. red, in axillary corymbs; calyx-tube cinereous pubescent or glabrous, 5-lobed; corolla glabrous or glandular-puberulent outside, small, 5-toothed. India. B.M. 5010.

T. glabra, Griff.=*Agapetes glabra*.—*T. macrantha*, Hook.=*Agapetes macrantha*. J.F. 1:95. R.B. 26:181.—*T. pulchra*, Hort., is offered in the trade as an orange-red-flid. form. This may be the same as *T. pulcherrima*, Wall., which equals *Agapetes variegata*.—*T. setigera*, Wall.=*Agapetes setigera*. F. TRACY HUBBARD.

THISTLE: *Carduus*, *Cirsium*. Blessed T.: *Cnicus*. Cotton T.: *Onopordon*. Globe T.: *Echinops*. Golden T.: *Scolymus*. Scotch T.: *Onopordon*. Sow T.: *Sonchus*.

THLADIANTHA (Greek, *to crush and flower*; the author of the genus is said to have named it from pressed specimens). *Cucurbitaceæ*. Herbaceous softly pubescent vines with tuberous roots, some of which are hardy, others adapted to the greenhouse.

Leaves ovate-cordate, denticulate, sinus deep; tendrils simple: fls. dioecious, rather large, golden yellow; male fls. solitary or racemose, calyx-tube short-campanulate, 5-lobed, corolla rather irregularly campanulate, 5-parted, stamens 5, ovary rudimentary; female fls. solitary, calyx and corolla as in the male, stamens rudimentary or none; ovary oblong, pubescent, with 3 placenta: fr. oblong, fleshy, indehiscent, many-seeded.—About 13 species, China, Java, and Himalayas.

dùbia, Bunge. A tall climber: lvs. light green, oval, base cordate, apex acute: fls. numerous, yellow, bell-shaped; male fls. solitary in the axils without bracts: fr. ovoid-oblong, about 2 in. long, red; seeds black, smooth. Summer. N. China. G.C. III. 28:279; 54:54. B.M. 5469 (male fl. only). G.M. 43:657.—According to R. I. Lynch, in Gn. 56, p. 518, the plants are of easy cult. and by planting both sexes and artificial pollination the fr. may be grown. He further states that the root-tubers are without buds but form buds just before growth commences, as does a root-cutting. According to Danske Dandridge, the plant is hardy in W. Va., increasing rapidly by tubers and becoming a pest when planted with choicer plants.

Oliveri, Cogn. More vigorous than the former: annual sts. attaining a height of 30 ft. or more, glabrescent, tubers absent: lvs. larger, cordate, acute, about 8 in. long: fls. more numerous, golden yellow. Cent. China. R.H. 1903, p. 473.—There is also a hybrid between these two species which is offered in the trade.

F. TRACY HUBBARD.†

THLÁSPI (Greek, *crushed*, referring to the strongly flattened pods and seeds). *Cruciferae*. Annual or perennial herbs which are glabrous or glaucous, rarely pilose, some of which are cultivated now and then.

Leaves basal, rosulate, entire or dentate; cauline oblong, hastate-auculate: fls. racemose, without bracts, white, rose, or pale purple; sepals erect, equal at base; petals obovate; stamens free, without appendages: silique short, laterally compressed, oblong, obovate or obcuneate.—About 90 species, widely distributed in the temperate, alpine, and arctic regions, mostly in the northern hemisphere, but also in S. Amer., S. Afr., and Austral.

alpestre, Linn. Perennial, 2–12 in. high but usually low, glabrous, somewhat glaucous, habit tufted, forming rather thick mats: basal lvs. in a rosette, petioled, obovate; cauline lvs. elongated-lanceolate, base cordate, entire or dentate; peduncle unbranched, terete: fls. white, sometimes somewhat reddish; sepals purplish. Alpine Eu.—Has been offered as a neat little rock-plant. It should be given shade and a cool moist soil. The material growing in Colo. and formerly called *T. alpestre* is now considered a distinct species, *T. coloradense*, Rydb. Perennial, caespitose: basal lvs. rosulate, broadly spatulate, sinuately crenate or subentire; cauline lvs. oblong or obovate, obtuse: infl. short and dense; fls. white; sepals with a white margin. Mountains of Wyo. and Colo. The fls. are larger than those of *T. alpestre* and the pod differs. It is uncertain whether the material in cult. in Amer. is this plant or *T. alpestre*.

arvense, Linn. PENNY CRESS. Annual or biennial, 6–18 in. high, glabrous, yellow-green: basal lvs. obovate or spatulate, petioled; upper lvs. oblong, remotely and irregularly dentate: fl.-st. mostly branched above: fls. small, white; sepals greenish. Eu.—A weed in most countries, including Amer.

T. bellidifolium, Griseb. Perennial, dwarf, caespitose: basal lvs. oblong-spatulate; cauline lvs. few, oblong, very short auriculate: fls. violet. Mountains of S. E. Eu. and Caucasus.—*T. rotundifolium*, Gaudin. Perennial, 2–6 in. high: sts. numerous, ascending: basal lvs. rotundate-ovate, petioled; cauline lvs. clasping, auricled: fls. violet, rarely white. Switzerland. G.C. III. 49:116.

F. TRACY HUBBARD.

THORN: *Crataegus*. Christ's T.: *Paliurus Spina-Christi*. Jerusalem T.: *Paliurus Spina-Christi*; also *Parkinsonia aculeata*. Swallow T.: *Hippophaë rhamnoides*.

THORN-APPLE: *Datura Stramonium*; also *Crataegus*.

THRIFT: *Armeria*, *Statice*.

THRINAX (Greek, *fan*). *Palmaceæ*, tribe *Corypheæ*. **THATCH PALM**. Fan palms well adapted for pot culture. Spineless palms: trunks low or medium, solitary or caespitose, ringed below, clothed above by the fringed

lf.-sheaths: lvs. terminal, orbicular or truncate at the base, flabellately plicate, multifid; segms. induplicate, bifid; rachis short or none; ligule free, erect, concave; petiole slender, biconvex, smooth on the margins; sheath usually beautifully fringed: spadices long; axis clothed with tubular sheaths, papery-coriaceous, split: fls. perfect, the calyx and corolla united into a lobed or entire cup, on rather long, slender pedicels, the pedicel with a caducous bract at the base; stamens 6, their filaments united below; ovary 1-celled: fr. the size of a pea.—About 17 species, native to W. Indies and Fla., and not much known in cult. For the new Porto Rican species, see Cook, Bull. Torr. Bot. Club, Oct., 1901 (vol. 28). Upon a technical embryo character some of the species below and many other wild species are segregated to constitute the genus *Coccothrinax*, Sargent. As that genus does not differ horticulturally, these species are here treated with *Thrinax*. See *Coccothrinax*.

The species are of slow growth, but succeed with indifferent care. They are mostly of elegant form and habit. A good specimen is shown in Fig. 3794.

3794. A good specimen of *Thrinax*.

A. Under surface of lvs. green.

B. Ligule with a blunt appendage at the middle.

radiata, Lodd. (*Coccothrinax radiata*, Schum. *T. elegans*, Hort.). Caudex short: lvs. green, glabrous or slightly puberulent beneath; segms. united to or beyond one-third; ligule broadly rounded, with a short, blunt appendage at the middle: spadix large, 2–2½ ft. long, paniculate. Cuba to Trinidad.—Said to have been known in cult. as *T. elegans* and *T. gracilis*.

BB. Ligule bluntly deltoid.

parviflora, Swartz. Caudex 10–20 ft. tall: lvs. 10–25 in. long, minutely pubescent, becoming glabrous, green beneath; segms. united one-fourth or one-sixth their length; ligule bluntly deltoid, 1½ lines long. Jamaica.—The plant of Fla. heretofore known as *T. parviflora* seems to be *T. floridana*, Sarg., a plant not in the trade. S.S. 10:510.

BBB. Ligule obsolete, truncate.

barbadensis, Lodd. (*Coccothrinax barbadensis*, Becc.). Trunk middle-sized: lvs. green, glabrous; segms. united at the base; ligule obsolete, truncate: spadix paniculate: berry polished, ⅓ in. thick. Barbados.

AA. Under surface of lvs. silvery or glaucous.

B. Lf.-segms. connivent at base.

argentea, Lodd. (*Coccothrinax argentea*, Schum.). Caudex 12–15 ft. high, 2–3 in. thick: lvs. shorter than the petiole, silvery gray beneath, making one of the most beautiful effects in all the palms; segms. united at the base; ligule concave, semi-lunar, erose. W. Indies.

BB. Lf.-segms. connivent for one-third their length.

excelsa, Lodd. Lvs. pale green above, hoary-glaucous beneath; segms. united one-third; ligule bluntly deltoid; sheath densely buff-lanate. Jamaica, British Guiana.—Held by some to be a form of the preceding.

BBB. Lf.-segms. connivent for one-half their length.

multiflora, Mart. (*T. graminifolia*, Hort.). St. medium, 6–8 ft. high: sheaths ragged, fibrous, irregularly reticulate, tomentose; young lvs. white woolly-tomentose; blade equaling the petiole, laciniate; segms. united one-half their length, ensiform-acuminate, rather strict, glaucous beneath; ligule transversely oblong, sinuate, 3-lobed. Haiti. I.H. 31:542.

Other species of *Thrinax* are in cult. in private collections (see p. 2446), but it is doubtful whether they are in the trade. Some of them may be listed as *Coccothrinax*. *T. altissima*, Hort. Lvs. large, $4\frac{1}{2}$ ft. diam., nearly orbicular, the upper lobe of the base folding over the lower one some 7 or 8 segms., rich glossy green above, brilliant silvery beneath, with about 58 segms. which reach over one-third of the way to the base; ligule deep buff-orange, subreniform, open at base; a small basal area of the lf. orange-tinted; petioles $4\frac{1}{2}$ ft. long, biconvex, slightly channeled above, bases included in a closely woven network of strong fiber, greenish yellow, the fiber ashy brown. Grows with vigor in Fla., on ordinary pineland. The botanical position of this palm is undetermined. —*T. argentea*, Chapm.=*Coccothrinax*. —*T. Chico*=*Acanthorrhiza* Chucó. —*T. crinita*, Griseb. & Wendl. Cuban. A moderate-sized palm with lvs. about 3 ft. diam., and with a short, stiff ligule. Probably belongs, according to Beccari, somewhere near *Coccothrinax argentea*. This palm was lost to science for 60 years and has recently been rediscovered. A specimen growing in the Brooklyn Botanic Garden has the trunk covered with a fibrous hair-like growth, unlike any W. Indian palms known. —*T. elegantissima*, Hort., seems to be unknown to botanists. It may be *T. elegans* which probably belongs to *T. radiata*. —*T. floridana*, Sarg. A slender tree, to 30 ft.: lf.-blades 3–4 ft. across, yellowish green, shining above; spadix 3–4 ft. long; fls. slender-pedicelled, the sepals and petals united; filaments subulate: fr. small, $\frac{1}{16}$ in. diam. or less. Fla. and Keys. —*T. Garberi*, Chapm.=*Coccothrinax*. —*T. keyensis*, Sarg. Rather stout, 25 ft., the trunk on a base of matted roots: lf.-blades 3–4 ft. across, yellowish green above; spadix 6 ft. or so long: fls. on short disk-like pedicels, and sepals and petals only partly united; filaments triangular: fr. $\frac{1}{16}$ in. or less thick. Lower Keys. —*T. microcarpa*, Sarg. Tree, 30 ft. or more: lf.-blades 3–4 ft. broad, pale green above and silvery white beneath: spadix 1–2 ft. long: fls. on disk-like pedicels, the sepals and petals only partly united; filaments triangular: fr. very small, only $\frac{1}{16}$ in. or less thick. Keys of Fla. —*T. Morrisii*, Wendl. One to $2\frac{1}{2}$ ft. high: lvs. glaucous beneath; segms. free for about two-thirds or three-fourths their length. G.C. III. 11:113; 30:353. Anguilla. —*T. Wendlandiana*, Becc. Lvs. flabellate-orbicular, paler beneath; segms. linear-oblong: spadix elongated: fls. long-pedicelled. Cuba and Honduras.

N. TAYLOR.†

THRIXSPERMUM (Greek, *hair and seed*, referring to the hair-shaped seeds). Syn., *Sarcophilus*. *Orchidaceae*. Epiphytic non-pseudobulbous orchids, grown for their bloom in the warmhouse.

Stems short, either covered with prominent persistent truncate bases of the lvs. or leafless: lvs. flat and often falcate, or narrow-linear, or none; racemes axillary; bracts small; sepals and petals nearly equal, free, spreading, the lateral sepals often more or less dilated at the base; labellum articulate at the end of the basal projection of the column, 3-lobed; column short, erect, produced at the base; pollen-masses 4; caps. usually linear or narrow-oblong.—Species 30, Old World.

Cecilæ, Reichb. f. (*Sarcophilus Cecilæ*, F. Muell.). Sts. short, sometimes elongated to 2–3 in.: lvs. linear or narrowly linear-lanceolate, thick, 2–3 in. long; racemes up to 6–8 in. long, erect, bearing above the middle several small short-pedicelled pink fls.; lateral sepals almost ovate, dorsal sepal narrower; petals still narrower; labellum shorter than the sepals. Austral.

Hartmannii, Reichb. f. (*Sarcophilus Hartmannii*, F. Muell.). Sts. short: lvs. fleshy, 3–5 in. long: scapes

erect: fls. rather small; sepals and petals white, spotted basally with red; labellum shorter, saccate, white, streaked with red-purple. Queensland. G. 32:337.

lilacinum, Reichb. f. (*Sarcophilus lilacinus*, Griff.). Climbing: sts. slender, 2–3 ft. high: lvs. alternate, ovate, pale green, $1\frac{1}{2}$ –2 in. long, cordate and amplexicaul at the base: raceme 1–8 in. long; rachis very stout, compressed, few- to many-fld.: fls. pale rose, white-lilac or bluish, very short-pedicelled; sepals and petals broadly ovate; labellum saccate, white, yellowish and pubescent within: caps. 4–6 in. long, linear. Malaya. B.M. 7754.

F. TRACY HUBBARD.

THRYÁLLIS (old Greek name, transferred to these plants). *Malpighiaceae*. Confusion in practice has arisen in the application of this name and *Galphimia*. As expressed by J. N. Rose, "the genus *Thryallis* was published by Linnæus in the second edition of his *Species Plantarum*, basing it upon a single species, *T. brasiliensis*. In 1829 Martius described two additional species, *T. longifolia* and *T. latifolia*. These two species, however, were soon found not to be congeneric with the original species, but instead of being taken out as a new generic type, were allowed to remain as *Thryallis*, while the true type of that genus was transferred to *Galphimia*." Kuntze gave the name *Hemsleya* to the two plants of Martius. If *Thryallis* is restored to its original application, with its legitimate extension, then the plants described under *Galphimia*, page 1312, become *T. brasiliensis*, Linn. (*G. brasiliensis*, Juss.); *T. hirsuta*, Kuntze (*G. hirsuta*, Cav.); *T. glauca*, Kuntze (*G. glauca*, Cav.). There is a native species, *T. angustifolia*, Kuntze (*G. angustifolia*, Benth.), in Texas and adjacent Mexico, 1 to $2\frac{1}{2}$ feet tall, more or less woody at base, with linear to lanceolate leaves and petals yellow turning reddish.

THRYPTÓMENE (Greek word said to refer to the low heath-like appearance of the plant). *Myrtaceae*. Glabrous heath-like shrubs, which were at one time popular greenhouse plants, now apparently not so commonly in cult. Lvs. opposite, small, entire: fls. small, sessile or pedicelled, solitary at the axils or rarely fasciculate; bracteoles 2; calyx-tube hemispherical, turbinate or short-campanulate limb with 5 petaloid or scarious, entire, spreading segms.; petals 5, persistent, usually connivent above the genital organs; stamens 10; ovary inferior, 1-celled: fr. sometimes 1-seeded, indehiscent, sometimes 2-seeded and spuriously 2-berried.—About 25 species, Austral.

Mitchelliæna, F. Muell. A compact, bushy shrub with slender branches: lvs. oblong, flat, $\frac{1}{4}$ – $\frac{1}{2}$ in. long; fls. in the upper axils solitary or in clusters of 2 or 3, white. Offered in S. Calif.—Intro. by Mrs. T. B. Shepherd, who says the plant rarely exceeds 4 ft. in height, blooms in midwinter and is good for cut-fls.

F. TRACY HUBBARD.†

THÛJA (*Thya* or *Thyia*, an ancient Greek name for a resinous tree or shrub). Also spelled *Thuja* or *Thuia*. Including *Biota*. *Pinaceae*. ARBOR-VITÆ. Ornamental woody plants, grown for their handsome evergreen foliage and formal habit.

Resiniferous trees with short horizontal much ramified branches; the flattened branchlets arranged frond-like: lvs. decussate, scale-like, appressed, usually glandular on the back: fls. monocious, globose, small, terminal on short branchlets, staminate yellow and consisting of usually 6 opposite stamens each with 2–4 anther-cells; pistillate consisting of 8–12 scales in opposite pairs, of which only the middle ones, or in the section *Biota* the lower ones, are fertile, each scale with 2 ovules inside at the base: strobiles globose-ovate to oval-oblong, with 2 seeds under the fertile scales.—Five species occur in N. Amer., E. and Cent. Asia. The wood is light and soft, brittle and rather coarse-

grained, durable in the soil; it is much used for construction, cabinet-making, and in cooperage. *T. occidentalis* contains a volatile oil, and thujin and is sometimes used medicinally.

The thujae are trees of narrow pyramidal habit, but low and bushy in many of the numerous garden forms, with much ramified branches, the branchlets arranged frond-like, flattened and clothed with small scale-like leaves; the fruit is a small strobile or cone not exceeding

3795. Typical form of *Thuja occidentalis*. ($\times \frac{1}{2}$)

3796. Seedling of *Thuja occidentalis*. ($\times \frac{1}{2}$)

1 inch in length. The well-known *T. occidentalis* is hardy North; and also *T. Standishii*, *T. plicata*, and several forms of *T. orientalis* are hardy as far north as Massachusetts. Thujae are favorites for formal gardens. They are all of regular symmetrical habit. Their numerous garden forms vary greatly in habit and in color of foliage. For planting as single specimens in parks they are mostly too stiff and formal, but they are well suited for massing on borders of streams or lakes. The most beautiful and the most rapidly growing species is *T. plicata*. Thujae are well adapted for hedges and windbreaks (see Gn.M. 2:15). They bear pruning well and soon form a dense hedge. They thrive best in somewhat moist, loamy soil and are easily transplanted. Propagation is by seeds sown in spring. The varieties, especially those of *T. occidentalis*, are usually propagated by cuttings taken late in summer and kept during the winter in a cool greenhouse or frame; also by grafting on seedling stock in summer or early in spring in the greenhouse. The varieties of *T. plicata* and *T. orientalis* are usually grafted, since they do not grow readily from cuttings, except the juvenile forms of the latter, as var. *decussata* and var. *meldensis*. Consult *Retinispora*.

A. Cones pendulous, with thin scales apiculate below the apex; seeds winged, compressed; branchlets ramified more or less horizontally, with a distinct upper and under side.

B. Lvs. yellowish or bluish green beneath, glandular: leading shoots compressed.

occidentalis, Linn. COMMON ARBOR-VITÆ. Erroneously but commonly called WHITE CEDAR (which is properly *Chamaecyparis*). Figs. 3795-3797. Tree, attaining 60 ft. and more, with short horizontal branches ascending at the end and forming a narrow pyramidal rather compact head: lvs. ovate, acute, usually glandular, bright green above, yellowish green beneath, changing in winter usually to dull brownish green: cones oval to oval-oblong, about $\frac{1}{2}$ in. long, brownish yellow with

usually 2 pairs of fertile scales; seeds $\frac{1}{4}$ in. long. New Bruns. to Man., south to N. C. and Ill. S.S. 10:532. Gn.M. 4:19. F.E. 25:495.—Much used for telegraph poles. A great number of garden forms, about 50, are in cult. The best known are the following: Var. *alba*, Nichols.

(var. *albo-spica*, Beissn. Var.

Queen Victoria, Hort.). Tips of

young branchlets white. Var.

argentea, Carr. (var. *albo-variegata*, Beissn.). Branchlets varie-

gated silvery white. Var. *aurea*,

Nichols. Broad bushy form, with

deep yellow foliage (F.E. 22:

797); also var. *Burrowii*, Douglas'

Golden and Meehan's Golden

are forms with yellow foliage.

See also var. *lutea*. Var. *aureo-*

variegata, Beissn. (var. *aurea*

maculata, Hort.). Foliage varie-

gated with golden yellow. Var.

Beteramsii, Schwerin. Copper-

colored, gradually changing to

green. Var. *conica densa*, Hort.

"Dense conical form." Var.

Columbia, Hort. "Strong habit;

foliage broad, with a beautiful

silvery variegation." Var. *com-*

pacta, Beissn. (var. *Froebeli*,

Hort. Var. *globularis*, Hort.).

Globose, light green form with rather thin branchlets.

Var. *cristata*, Carr. Irregular dwarf, pyramidal form

with stout, crowded, often recurved branchlets. Var.

Douglasii pyramidalis, Spaeth. Dense pyramidal form

with short densely branched fern-like branches often

cristate at the ends. Var. *dumosa*, Hort. (var. *plicata*

dumosa, Gord.). Dwarf and dense form of somewhat

irregular habit; in foliage similar to var. *plicata*. G.M.

54:223. Var. *Ellwangeriana*, Beissn. (var. Tom Thumb).

Fig. 3798. A low broad pyramid, with slender branches

clothed with two kinds of foliage, adult lvs. and pri-

marordial, acicular spreading lvs.; it is an intermediate

form between the var. *ericoides* and the type. R.H.

1869, p. 350; 1880, p. 93. Var. *Ellwangeriana aurea*,

Spaeth. Like the preceding but with yellow foliage.

Var. *ericoides*, Beissn. & Hochst. (*Retinispora dubia*,

Carr. *R. ericoides*, Hort., not Zucc.). Fig. 3799. Dwarf,

globose or broadly pyramidal form, with slender branch-

lets clothed with needle-shaped soft spreading lvs.,

dull green above, grayish green beneath and assuming

a brownish tint in winter. R.H. 1880, pp. 93, 94. A

juvenile form. See, also, *Retinispora*. Var. *globosa*,

Beissn. (var. *compacta globosa*, Hort.). Dwarf globose

form, similar to var. *compacta*, but lower and smaller.

Var. *fastigiata*, Beissn. (var. *pyramidalis*, Hort. Var.

columnaris, Hort.). Columnar form with short branches.

Var. *filiformis*, Beissn. (var. *Douglasii*, Rehd.). Bushy

3797. The arbor-vitæ.—*Thuja occidentalis*. (Nearly full size)

form, with long and slender sparingly ramified branches nodding at the tips, partly 4-angled and clothed with sharply pointed lvs. A very distinct form, somewhat similar to *Chamaecyparis pisifera* var. *filifera*. M.D.G. 1901:357. Var. *Harrisonii*, Hort. "A neat little tree with the entire foliage tipped almost pure white." Var. *Hoveyi*, Veitch. Dwarf, dense, ovate-globose form with bright green foliage. Var. *intermedia*, Hort. "Of dwarf,

3798. *Thuja occidentalis* var. *Ellwangeriana*. ($\times \frac{1}{2}$)

compact habit." Var. *Little Gem*, Hort. Very dwarf dark green form, growing broader than high. Var. *lutea*, Veitch (var. *elegantissima*, Hort. Var. *George Peabody* Golden). Pyramidal form, with bright yellow foliage. F.E. 27:7. Var. *nana*, Carr. (*T. plicata* var. *compacta*, Beissn.). Dwarf compact globose form; foliage similar to var. *placata*. Var. *pendula*, Gord. With the branches bending downward and the branchlets more tufted. M.D.G. 1901:169. Var. *placata*, Mast. (*T. plicata*, Parl., not Don. *T. Wareana*, Booth). Pyramidal tree, darker and denser than the type: branchlets short, rigid, much flattened: foliage distinctly glandular, brownish dark green above, bluish green beneath. G.C. III. 21:258. Said to have been intro. from N. W. Amer., but not found wild there. Var. *pumila*, Beissn. Dwarf dense form with dark green foliage. Var. *pygmaea*, Hort. (*T. plicata* var. *pygmaea*, Beissn.). Similar to var. *dumosa*, but still dwarfer, with bluish green foliage. Var. *Reidii*, Hort. "Broad, dwarf form with small lvs., well retaining its color during the winter." Var. *Spaethii*, P. Smith. Peculiar form with two kinds of foliage; the younger and lower branchlets with spreading acicular lvs. like those of var. *ericoides*, but thicker in texture; the upper branchlets slender and sparingly ramified much like those of var. *filiformis*. Gt. 42, p. 539. Var. *Vervaneana*, Henk. & Hochst. Of smaller and denser habit than the type: branchlets slenderer, with yellowish foliage, bronzy in winter. F.E. 30:1117. G.W. 1, p. 296; 6, p. 474. Var. *Wagneriana*, Beissn. (var. *Versmannii*, Hort.). Globose form, retaining its bright green color during the winter. M.D.G. 1895:123. Var. *Wareana*, Beissn. (var. *robusta*, Carr. *T. caucásica*, *T. talárica*, and *T. sibirica*, Hort.). Pyramidal tree, lower and denser than the type, with stouter branchlets; foliage bright green. Very desirable form. Gn.M. 2:11. R.H. 1908, p. 79. G.W. 1, p. 295. Var. *Woodwardii*, Hort. "Dense, globose form, with deep green foliage."

BB. Lvs. with whitish markings beneath, without or with indistinct gland.

placata, Don (*T. gigantea*, Nutt. *T. Menziesii*, Douglas. *T. Lobbii*, Hort.). Fig. 3800. Tall tree,

attaining 200 ft., with short horizontal branches often pendulous at the ends, forming a narrow pyramid: trunk with a much-buttressed base and clothed with cinnamon-red bark: branchlets slender, regularly and closely set: lvs. bright green and glossy above, dark green beneath and with whitish triangular spots: lvs. of vigorous shoots widely spaced, ending in long points parallel to axis, of the lateral branchlets acute and scarcely glandular: cones cylindric-ovoid, little over $\frac{1}{2}$ in. long; scales 8-10, elliptic-oblong, usually the 3 middle pairs fertile; seeds winged, notched at the apex. Alaska to N. Calif. and Mont. S.S. 10:533. G.C. III. 21:215, 258 (adapted in Fig. 3800). G.F. 4:116. Gn. 74, p. 65. G. 9:305. M.D.G. 1909:42. Var. *atróvirens*, Sudw. (*T. gigantea atróvirens*, Beissn.). Foliage dark green. Var. *fastigiata*, Schneid. (*T. gigantea fastigiata*, Beissn. *T. gigantea pyramidalis*, Bean). Columnar form. G.C. III. 41:200. Var. *gracilis*, Rehd. (*T. gigantea* var. *gracilis*, Beissn.). Smaller tree, with more slender branches and smaller foliage of paler green. Var. *pendula*, Schneid. (*T. gigantea pendula*, Beissn.). Form with slender pendulous branches.

Stándishii, Carr. (*T. japonica*, Maxim. *T. gigantea* var. *japonica*, Franch. & Sav. *Thujopsis Stándishii*, Gord.). Fig. 3801. Similar to the preceding but lower, usually only 20-30 ft. high: branchlets more irregularly set, thicker and less compressed: lvs. of vigorous shoots closely placed together, ending in short rigid points spreading outward, of the lateral branchlets ovate, obtusish, thickish, lighter green above, darker beneath and with whitish, triangular spots, without gland: cones oval, little over $\frac{1}{2}$ in. long; scales 8, oval, usually the 2 middle pairs fertile. Japan. G.C. III. 21:258 (adapted in Fig. 3801). R.H. 1896:160. C.L.A. 11:311. S.I.F. 1:11.

AA. Cones upright, the thickened scales with a prominent horn-like process below the apex; seeds wingless: branchlets ramified in a vertical plane with both sides nearly alike. (*Biota*.)

orientalis, Linn. (*Biota orientalis*, Endl.). Pyramidal or bushy tree, attaining 25 ft., with spreading and ascending branches: branchlets thin: lvs. rhombic-ovate, acute, bright green, with a small gland on the

3799. *Thuja occidentalis* var. *ericoides*. ($\times \frac{1}{2}$)

back: cones globose-ovate, $\frac{1}{2}$ -1 in. long; usually 6 ovate scales, each with a horn-like process, the uppermost pair sterile. From Persia to E. Asia, in Japan probably only cult. There are many garden forms, of which the following are the best known: Var. *athrotaxoides*, Carr. Dwarf, irregularly and not frond-like branching; branchlets nearly quadrangular, slender, dark green. R.H. 1861, p. 230. Var. *aurea*, Hort. Low,

compact, globose shrub, golden yellow in spring, changing to bright green. G.W. 1, p. 299. Var. *aurea conspicua*, Hort. More erect, the intense golden foliage partially suffused with green. Var. *aurea nana*, Hort. Golden yellow foliage and very dwarf and compact habit. Var. *aureo-variegata*, Hort. Of pyramidal habit: branchlets variegated with yellow. Var. *beverleyensis* (*Thuja beverleyensis*, Hort.). A columnar form with the tips of the branchlets golden yellow. Var. *decussata*, Beissn. & Hochst. (*Retinospora juniperoides*, Carr. *Chamaecyparis decussata*, Hort.). Fig. 3369. Dwarf globose form: lvs. linear-lanceolate, spreading, stiff, acute, bluish green. A juvenile form; see, also, *Retinospora*. Var. *elegantissima*, Gord. Of low columnar habit, bright yellow in spring, yellowish green afterward. Var. *falcata*, Lindl. Of dense pyramidal growth, deep green, the horns of the strobiles curved backward. Var. *filiformis stricta*, Hort. Round-headed dwarf bush, with upright, thread-like branches. Var. *gracilis*, Carr. Of pyramidal somewhat loose and slender habit, with bright green foliage. Var. *freneioides* and var. *nepalensis* are hardly different from this. Var. *meldensis*, Veitch. Of columnar pyramidal somewhat irregular growth: lvs. acicular, bluish green, sometimes passing into the normal form. Intermediate between the var. *decussata* and the type. Var. *pendula*, Parl. (var. *filiformis*, Henk. & Hochst. *T. pendula*, Lamb. *T. filiformis*, Lindl.). Branches pendulous, thread-like, sparingly ramified, and with the lvs. wide apart and acuminate. Var. *funiculata*, Hort., and var. *intermedia*, Carr., are intermediate forms between this variety and the type. H. U. 4:70. Var. *pyramidalis*, Endl. Of pyramidal habit, with bright green foliage; one of the tallest and hardiest varieties. Var. *semperaurescens*, Veitch. Dwarf, globose; the golden hue of the foliage remains throughout the whole year. Var. *Sieboldii*, Endl. (var. *japonica*, Sieb. Var. *nana*, Carr. Var. *Zuccariniana*, Veitch. Var. *compacta*, Beissn.). Globose compact low form, bright green. *T. dolobrata*, Linn.—*Thujopsis dolobrata*.

ALFRED REHDER.

THUJÓPSIS (Greek, *Thuja*-like). Also spelled *Thuyopsis*. *Pinaceae*. Ornamental tree or shrub grown chiefly for its handsome evergreen foliage and the formal habit.

A tree closely related to *Thuja* and chiefly distinguished by the broader much flattened branchlets and by its conelets having 3-5 winged seeds under each scale.—Only one Japanese species. Its yellowish white close and straight-grained wood is very durable and is used in Japan in boat- and bridge-building.

Thujopsis is one of the most beautiful Japanese conifers and forms a pyramidal tree, in cultivation sometimes shrubby, with spreading branches, the branchlets arranged in a frond-like fashion, much flattened and clothed with scale-like glossy green foliage. It is well adapted for planting as a single specimen on the lawn wherever it can be grown successfully. It is hardy as far north as Massachusetts, but usually suffers from summer drought. It thrives best in a sheltered and

shaded position and in moist loamy soil, and seems to grow to perfection only in cool and moist climates. Propagation is by seeds, also by cuttings and by grafting like *Thuja*. Plants raised from cuttings usually grow into bushy round-headed plants. Plants grafted on *Thuja* are said to be short-lived. Seedlings are therefore to be preferred.

dolobrata, Sieb. & Zucc. (*Thuja dolobrata*, Linn.). Pyramidal tree, attaining 50 ft., or sometimes shrubby: branchlets irregularly whorled or scattered, horizontally spreading and often nodding at the ends; branchlets $\frac{1}{2}$ – $\frac{3}{4}$ in. broad: lvs. glossy green above, marked with a broad white band beneath, those of the upper and under side obovate-oblong, obtuse, adnate except at the apex, the lateral ones spreading, ovate-lanceolate and curved (hatchet-shaped), obtusish: cone globose-ovoid, about $\frac{3}{4}$ in. long; scales 6-10, much thickened at the obtusely pointed apex, the middle ones fertile and with 3-5 winged seeds under each scale. Japan. S.Z. 2:119, 120. G.C. II. 18:556. Gn. M. 2:23. G.Z. 25, p. 49. F.E. 16:517. C.L.A. 7:364. S.I.F. 1:11. Var. *altissima*, Ansonge. Vigorous and of almost columnar habit. Var. *cristata*, Ansonge. Branches compact, very full and somewhat crisped. Var. *nana*, Sieb. & Zucc. (*T. latévirens*, Lindl.). Dwarf form, with more slender and narrower branchlets of a lighter green. Var. *plicata*, Ansonge. Very vigorous with heavy branches which hang over and appear folded. Var. *variegata*, Fortune. Tips of branchlets creamy white. Var. *Hondai*, Makino (*T. Hondai*, Henry). Tall tree, to 100 ft.: branches more densely ramified: lvs. smaller and whiter beneath: cone subglobose, with the scales not thickened at the apex. This is the more northern form and probably harder than the type which has been called var. *australis* by

Henry. Recently intro. and now growing at the Arnold Arboretum.

T. borealis, Hort.—*Chamaecyparis nootkatensis*.—*T. Standishii*, Gord.—*Thuja Standishii*.

ALFRED REHDER.

THUNBERGIA (after Karl Peter Thunberg, professor of botany at Upsala and successor to Rudbeck and Linnæus; died 1828). *Acanthaceae*. Mostly tall perennial climbers producing flowers in great profusion; greenhouse, and in the open far South.

Leaves opposite: fls. blue, yellow, purple, or white, solitary and axillary or in racemes; calyx annular and scarcely lobed or toothed or 10-15-toothed, surrounded by 2 large bracts which often inclose also the corolla-tube; corolla trumpet-shaped, with a spreading limb, tube curved or oblique, often compressed, enlarged toward the mouth; stamens 4, didynamous, fixed near the base of the tube, filaments thickened at the base, separate; anther-cells parallel, equal, mostly mucronate at the base: ovary seated on a fleshy disk, 2-loculed, each cell with 2 ovules (rarely only 1). The *Thunbergiae* are distinguished by the contorted corolla, the 4-seeded caps., and the globose seeds.—About 75 species, in the tropics of the world, particularly in Afr.

3800. *Thuja plicata*. ($\times \frac{1}{2}$)3801. *Thuja Standishii*. ($\times \frac{1}{2}$)

The thunbergias are nearly all vigorous greenhouse climbers resembling allamandas in habit. In large conservatories where they are not cramped for room they flower freely and display their flowers to the best advantage. Severe pruning, which is necessary in small greenhouses, prevents the production of flowers. The larger species, *T. laurifolia*, *T. affinis*, *T. grandiflora*, *T. mysorensis*, and *T. coccinea* are rapid growers, requiring plenty of feeding and root-room. All do better in open beds than in pots. They may be propagated either from seeds or by cuttings which are taken from the young wood which starts into growth after the plants have been cut back during winter. These produce few flowers the following autumn, but bloom freely the second season. As a rule, the plants flower in late summer or autumn, but the time of flowering may be made to vary according to treatment in some species. *T. alata* and its varieties and *T. fragrans* are often treated as annual garden plants, flowering in late summer. *T. erecta* and *T. affinis*, when grown in pots, form rather compact shrubby plants (see Gn. 24, p. 314; 30, p. 292; 47, p. 150). In Porto Rico *T. alata* has escaped and is common. Cook writes that there are two forms, one with corolla-limb cream-yellow and other whitish.

Thunbergias and allamandas are great favorites in central and southern Florida, being used on verandas,

3802. *Thunbergia alata*. ($\times \frac{1}{2}$)

arbors, small trees, old stumps, trellises and buildings. Of the blue-flowered kinds *T. grandiflora* is hardiest and commonest. It has large heart-shaped leaves which overlap one another in a charming manner. It blooms from September until Christmas, the flowers being light blue and rather dull. The form of *T. laurifolia* known to the trade as *T. Harrisii*, has nearly sky-blue flowers, of a deeper but brighter hue than the preceding. It is a taller-growing and choicer plant, and has ten or more flowers in a raceme, while those of *T. grandiflora* are solitary in the axils. *T. fragrans* is the common white-flowered kind. The form cultivated in Florida is probably var. *vestita*, as the blossoms are not fragrant. *T. alata* is a general favorite. The flowers range from buff and white to orange with a deep purplish brown throat, the last form being the most popular. This species is killed to the ground by sharp frost every winter but sprouts vigorously the following spring. It also comes up from self-sown seed. This species grows only 7 to 8 feet high. All the thunbergias mentioned above are easily raised from cuttings or layers in summer. *T. erecta* is not a climber but has a somewhat straggling habit. It has small dark green leaves and large deep purplish blue gloxinia-like flowers which are white at the base. There is a pure white variety of it. It blooms all summer and autumn. It is readily raised from cuttings during the rainy season. (H. Nehrling.)

KEY TO THE SPECIES.

- A. Fls. axillary, solitary.
 B. Lvs. entire. 1. *affinis*
 BB. Lvs. angularly toothed.
 C. Petioles winged. 2. *alata*
 CC. Petioles not winged.
 D. Color of fls. white: corolla-lobes truncate and sinuately toothed at the apex. 3. *fragrans*
 DD. Color of fls. blue (white only in varieties).
 E. Plant erect or suberect.
 F. Lvs. petiolate. 4. *erecta*
 FF. Lvs. sessile. 5. *natalensis*
 EE. Plant climbing.
 F. Throat of the corolla yellow. 6. *chrysops*
 FF. Throat of the corolla white. 7. *grandiflora*
 AA. Fls. in terminal or axillary racemes (see, also, *T. grandiflora*).
 B. Color of fls. blue. 8. *laurifolia*
 BB. Color of fls. yellow. 9. *mysorensis*
 BBB. Color of fls. scarlet. 10. *coccinea*
 11. *elegans*

1. *affinis*, S. Moore. A rambling shrub, 10–12 ft. high, smooth: branches 4-angled: lvs. short-petioled, elliptic, acute, entire: fls. 2 in. across, deep purple-blue, with a yellow throat. Summer. Trop. Afr. B.M. 6975. G.C. III. 2:461. G.M. 32:291.—This plant is closely allied to *T. erecta*, from which it differs by its entire lvs. and larger fls., which are about twice the size of those of *T. erecta*. When grown in a pot the plant forms a compact shrub, but when given more room it is a rambling climber.

2. *alata*, Bojer. BLACK-EYED SUSAN. Fig. 3802. St. square, climbing, hairy: lvs. opposite, triangular-ovate, hastate, repand-toothed, rough-pubescent, tomentose beneath; petioles winged, about as long as the lvs.: fls. solitary, on axillary peduncles; calyx very small, surrounded by 2 large inflated bracts; corolla-tube somewhat longer than the involucre, dark purple within; limb rotate, oblique, of 5 rounded segms., buff or cream-colored. S.E. Afr. B.M. 2591. P.M. 2:2. B. 5:238 (not good). L.B.C. 11:1045. J.H. III. 48:11. G.L. 27:38.—A perennial climber which may also be treated as an annual greenhouse plant. Usually prop. by seeds. It is used either as greenhouse climber or to grow on trellises outdoors. Outside it flowers mostly in Aug., but by prop. at various times plants may be had in blossom nearly the whole year in the greenhouse. There are many varieties, some of which have been described as species.

Var. *álba*, Paxt. (*T. alata* var. *albiflora*, Hook.). Fls. white, with a blackish center. P.M. 3:28. B.M. 3512. Var. *aurantiaca*, Kuntze (*T. aurantiaca*, Paxt.). Fls. bright orange, with a dark center. The best of the group. P.M. 6:269. H.U. 1, p. 355. Subvar. *Doddssii* has variegated lvs. P.M. 15:221. F.S. 4:415. Var. *Bakeri*, Hort. (*T. Bakeri* or *Bäckerii*, Hort.). Fls. pure white. Var. *Fryeri*, Hort. (*T. Fryeri*, Hort. *T. alata* var. *intus-alba*, Hort.). Pale orange, with a white center. Var. *sulphurea*, Hort. Fls. sulfur-yellow. Var. *lutea*, Hort. (*T. alata* var. *unicolor*, Hort.). Fls. entirely yellow.

3. *fragrans*, Roxbg. St. slender, climbing: lvs. lanceolate to triangular-ovate, cordate or subcordate, mostly angularly toothed on each side of the base, rough on both sides, petiolate: fls. white, axillary; corolla-tube narrow; limb spreading, $1\frac{1}{2}$ in. across,

lobes truncate and repandly toothed at the end. Summer. India.

Var. *lævis*, Clarke, is glabrous. B.M. 1881. L.R.C. 20:1913. G.C. III. 46:410. Var. *vestita*, Clarke, is more hairy and the fls. are not fragrant.

4. *erecta*, T. Anders. (*Meyenia erecta*, Benth.). Shrub, 2-4 ft. high, with loose spreading branches, half-erect: lvs. opposite, petiolate, ovate or subrhomboid, smooth, entire or sinuate-toothed: fls. solitary on axillary peduncles; calyx cut into 12-14 short teeth, concealed by the large bracts; corolla funnelform; tube curved, deep yellow within; limb purple, $1\frac{1}{2}$ -2 in. across, of 5 subrotund obovate lobes. Trop. W. Afr. B.M. 5013. F.S. 11:1093. R.H. 1863:251. I.H. 3:99. F. 1855:225. J.H. III. 28:35; 49:261; 54:39.—A greenhouse shrub, producing fls. freely at almost any season. Grows in the open in Fla. Not a climber. Var. *alba*, Hort. Fls. white. Var. *cærulea*, Hort. Fls. large, intense violet, with orange throat.

5. *natalensis*, Hook. Plants erect, 2 ft. or more high, shrubby at base, green above: sts. quadrangular, mostly glabrous: lvs. somewhat crowded, opposite, sessile, ovate, acute or subacuminate, sinuate-dentate, glabrous above, hairy on the veins beneath: fls. large, pale blue, yellow in the throat, subhorizontal on erect peduncles which are shorter than the lvs.; tube of the corolla yellow, 2 in. long, curved upward, limb of 5 broad spreading obovate lobes; calyx of 6 teeth. Natal. B.M. 5082. G.C. III. 37:162.—Very near *T. erecta*, which has petiolate lvs. and a greater number of calyx-teeth (if constant?).

6. *chrÿsops*, Hook. St. climbing, slightly hairy: lvs. opposite, petiolate, ovate-cordate, angularly toothed: peduncles axillary, solitary, 1-fld.: corolla funnelform or campanulate; tube yellow, limb purple, bluish around the throat. Sierra Leone. B.M. 4119. F.S. 1:5. P.M. 11:221. F. 1844:193.—Naturally a climber, but said to become somewhat erect if grown in a coolhouse.

7. *grandiflora*, Roxbg. Fig. 3803. St. tall, climbing: lvs. broadly ovate, angularly cordate and toothed or lobed, somewhat roughened on both sides, petiolate: fls. solitary or in short, stout racemes in the lf.-axils, bright blue, becoming whitish in the throat; corolla-tube bell-shaped; limb 3 in. across, of 5 large, spreading rounded lobes. Bengal. B.M. 2366. P.M. 7:221. L.B.C. 4:324. B. 2:76. B.R. 495. Gn. 47:150. I.H. 42:32. G.C. III. 9:789.—A very large perennial greenhouse climber; flowers during the summer or autumn. There is also a white-fld. variety.

8. *laurifolia*, Lindl. (*T. Harrisii*, Hook. *T. grandiflora*, Wall.). St. terete, smooth except the youngest, twining: lvs. long-petiolate, ovate-oblong to oblong-lanceolate, acuminate, rounded at the base, smooth, entire or slightly toothed: fls. 3 in. across, pale blue, white or yellow in the throat, borne in axillary whorls or in a raceme in which they are clustered or whorled; corolla with a wide, oblique trumpet-shaped tube and a large 5-lobed limb. India. B.M. 4985; 4998. F.S. 12:1275. Gn. 12, p. 420; 30:292 and p. 293. R.H. 1860, p. 342. J.H. III. 28:345; 45:131. Gng. 3:295. G. 3:42, 43. G.W. 3, p. 45; 10, p. 180.—Perennial greenhouse climber, flowering profusely in winter. Prop. by cuttings.

9. *mysorensis*, T. Anders. (*Hexacentris mysorensis*, Wight). Climbing shrub, with long, slender branches: lvs. opposite, petiolate, oblong-lanceolate, acuminate, entire or somewhat distantly toothed: racemes long, pendulous: fls. yellow, 2 in. across, the tube purple, inclosed by the spathe-like bracts; limb 4-lobed, the upper lip erect, concave, with reflexed side lobes, lower lip of 3 subequal, spreading lobes. India. B.M. 4786.

F.S. 8:752. S.H. 2, p. 130. G.C. III. 40:356. J.F. 3:285. G.W. 3, p. 187.—A tall greenhouse climber which flowers, according to treatment, at all seasons.

Var. *lutea*, Hort. (*Hexacentris lutea*, Hort., Veitch. G.C. 1854, p. 151, not *T. lutea*, T. Anders.), has the fls. pure yellow; a variety with a crimson limb and yellow tube is figured in Paxton's Flower Garden, 3:88.

10. *coccinea*, Wall. (*Hexacentris coccinea*, Nees). A very tall climber: st. much branched, 4-angled: lvs. short-petiolate, variously shaped, the lower broadly ovate, with a hastate or cordate angled base, the upper ovate, cordate, all angularly toothed or the upper entire: fls. in terminal or axillary racemes, 1-3 ft. long; bracts large, inflated, as long as the tube; limb scarlet, of 5 reflexed emarginate lobes; throat orange. Autumn and winter. India. B.M. 5124. L.B.C. 12:1195. F.S. 23:2447-48. R.H. 1890, p. 197. G.W. 3, p. 44.

11. *élégans*, Borzi. Resembles *T. coccinea*. The fls. are said to vary from red to intense yellow. Known only from plants in the Palermo Botanic Garden, to which it is supposed to have been intro. from a nursery in S. France.

T. Gibsonii, S. Moore. Sts. prostrate: lvs. about 1 in. long, triangular, glossy above; peduncles axillary, erect, 3 in. long: fls. solitary, about $1\frac{1}{4}$ in. across, yellow, each with a pair of inflated and united crimson-stained bracts. British E. Afr. B.M. 8604.—*T. primulina*, Hemsl. Perennial, silky hairy at first:

3803. *Thunbergia grandiflora*. ($\times\frac{1}{2}$)

lvs. rhomboid ovate, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. long, with 1 small lobe on each side: fls. axillary, solitary, about $1\frac{1}{2}$ in. across, resembling the common primrose in shape and color. E. Trop. Afr. B.M. 7969.—*T. Vogeliana*, Benth. (*Meyenia Vogeliana*, Benth.). Erect: lvs. large, ovate or oblong, dark green; fls. about equaling those of *T. erecta*, deep bluish violet with yellowish throat: handsome summer-flowering species. Fernando Po, Afr. B.M. 5389.

HEINRICH HASSELBRING.

THUNIA (Count Thun-Tetschen, who had an important collection of orchids about the middle of the nineteenth century). *Orchidaceæ*. Tall plants with annual leafy stems terminating in a raceme of showy flowers.

Formerly united with *Phaius*, from which it differs by the terminal infl.: sepals and petals similar, spreading; labellum convolute over the column, spurred, ornamented with several crests consisting of lines of fleshy hairs; pollinia 8: fls. subtended by large membranous bracts.—About 6 species in N. India, Burma, and in the S. Himalaya region ascending to a height of 6,000 ft.

The culture of the thunias is very simple. They begin growth naturally at the end of February or early in March. As soon as new growth is visible the plants should be given new material, consisting of fibrous peat or fern-root and sphagnum mixed with loam and some sand and potsherds for drainage. In their native home the plants are said to be epiphytic, and when treated as terrestrial orchids the native habit may be imitated by setting them well above the pot, which should not be too large. For the first four to six weeks until the young roots have made good growth, it is necessary to apply water sparingly. Thunias are very rapid-growing orchids and may be liberally supplied with liquid manure until the end of the flowering season, which occurs about the middle of August. Soon after this the leaves fall. The old stems winter in this condition and serve as food reservoirs for the young growth of the next season, but although they remain on the plant two years they form no leaves the second season. During the resting-period they should be kept in a rather

3804. *Thunia alba*. ($\times \frac{1}{4}$)

dry atmosphere and be given only enough water to prevent the stems (pseudobulbs) from shriveling. This is one of the few orchids which can be profitably propagated by cutting the old stems into lengths of about 6 inches and rooting them in sand or sphagnum. When rooted the young plants may be potted in the usual way. A temperature of 60° to 65° is favorable during the growing season.

álba, Reichb. f. (*Phaius álbus*, Lindl.). Fig. 3804. Suberect, 2-3 ft., clothed with sheathing, oblong-lanceolate, striate lvs. 6 in. long: raceme drooping at the end of the st., 6-12-fl.: fls. white, 3-4 in. across when fully open; sepals and petals oblong-lanceolate, acuminate; labellum shorter than the segms., not manifestly 3-lobed, lateral lobes convolute over the column, apex spreading, wavy and finely crisp; color of labellum white veined with purple in the throat, with 5-9 purple or yellow fringed keels; wings of the column entire. April-Aug. Burma and S. Himalaya region. B.M. 3991. B.R. 24:33. P.M. 5:125. F.C. 3:125. R.H. 1874:450. Gt. 47, p. 233. G. 31:475.—There are several varieties of this species. The throat of the labellum is often yellow.

Bénsoniæ, Hook. f. (*Phaius Bénsoniæ*, Benth.). Sts. fascicled, 1-2 ft. high, leafy: lvs. linear-lanceolate, 8-10

in. long; fls. like those of *T. álba* but of a pale purple color; labellum large, 3-lobed, deep purple in front, with a yellow crested disk, with 6-7 rows of fringe-like golden yellow hairs; spur short, slender. India. July-Sept. B.M. 5694. G.M. 31:557. F.W. 1871:161.—The most showy species of the genus.

Marshalliána, Reichb. f. (*Phaius Marshalliæ*, Nichols.). Closely related to *T. álba*. Sts. somewhat stronger: segms. pure white, acuminate: labellum evidently 3-lobed, with the lateral lobes surrounding the column, middle lobe wavy and crisp; color of labellum yellowish white, with 5 orange-fringed keels in the throat; wings of the column toothed. May-Aug. India. R.B. 21:229. S.H. 2, p. 335. Var. *ionophlèbia*, Reichb. f., has the center of the labellum bright yellow, paler toward the margin. Var. *álba*, Reichb. f., has white fls. with sulfur-yellow disk to the lip.

T. Veitchiána = *T. Bensoniæ* $\times$ *T. Marshalliána*. Sepals and petals white, flushed light mauve at tips; front of lip mauve-purple, the base white, purple-lined. HEINRICH HASSELBRIEG.

THÛYA: *Thuja*.

THUYÓPSIS: *Thujopsis*.

THYMELÆA (Greek, *thyme* and *olive*, referring to the thyme-like foliage and the small olive-like fruit). *Thymelæaceæ*. Hardy or half-hardy perennial herbs, subshrubs or small shrubs, which are very much branched: lvs. sparse, frequently small or narrow: fls. small, sessile and fascicled or solitary at the axils, hermaphrodite or polygamous by abortion; perianth urn-shaped or rarely, especially in male fls., with a slender cylindrical tube; lobes 4, spreading; stamens 8; ovary subsessile, 1-celled: fr. dry.—About 20 species, Medit. region, chiefly, also in Canary Isls., and in Asia. *T. hirsuta*, Endl. (*Passerina hirsuta*, Linn.). Decumbent greenhouse or half-hardy shrub, 1-2 ft. high: sts. slender, fastigate branched: lvs. coriaceous, ovate, nearly round or oblong, obtuse, 2-3 lines long, glabrous above, white-tomentose beneath: fls. white, in axillary or terminal few-fl. fascicles, which equal the lvs. July. Medit. region. B.M. 1949. *T. Tartonraira*, All. (*Daphne Tartonraira*, Linn. *Passerina Tartonraira*, Schrad.). Small hardy shrub, wholly silky-canescens, whitish or becoming fulvous: lvs. coriaceous, obovate or obovate-oblong, 5-10 lines long: fls. white, numerous, 2-5 glomerate in the upper axils. June. S. Eu.

F. TRACY HUBBARD.

THÏMUS (the old Greek name used by Theophrastus either for this plant or for savory). *Labiataæ*. **THYME**. Small shrubs or subshrubs, mostly hardy, and excellent for edging and the rockery.

Leaves small, entire; floral lvs. similar or changing to bracts in the spike: floral whorls usually few-fl., sometimes all distant and axillary, sometimes gathered in terminal short or lax spikes; bractlets minute: calyx ovoid, 10-13-nerved, 2-lipped, 5-toothed; corolla-tube included or exerted, naked inside, limb somewhat 2-lipped; stamens 4, in pairs: nutlets ovoid or oblong, smooth.—About 120 species, broadly dispersed in temperate regions, although the greatest number are natives of the Medit. region.

Thymes are erect or prostrate plants with strong mint-like odor. Most of the species are grown as a ground-cover on banks, in borders, or rockwork. The creeping or prostrate habit, ability to persist in dry places and poor soils, and the colored or woolly foliage of some species make them adaptable to a variety of uses. The common *T. Serpyllum* is evergreen. *T. vulgaris* is the thyme of sweet-herb gardens, being prized in cookery. All thymes are easily propagated by means of division, although seedlings may sometimes be used to renew plantations of some of the species, particularly of *T. vulgaris*. Several names occur in American catalogues, all of which seem to be referable to three species, one of

which is not a true *Thymus*. See *Sage*, where general culture of such herbs is given.

KEY TO THE SPECIES.

- A. Floral lvs. similar to the cauline, narrower or scarcely broader, lax.
 - B. Sts. suberect, like a little shrub. 1. *vulgaris*
 - BB. Sts. procumbent: flowering branches short-ascending.
 - C. Lvs. ovate, oblong, or elliptic.
 - D. Apex of lvs. acute. 2. *Herba-barona*
 - DD. Apex of lvs. obtuse (usually broadly so).
 - E. Branches all ascending from the base: upper lip of corolla short and broad. 3. *Chamædrys*
 - EE. Branches trailing at base, the flowering ones ascending: upper lip of corolla oblong. 4. *Serpyllum*
 - CC. Lvs. linear-subulate to linear-lanceolate.
 - D. Surfaces of lvs. tomentose. 5. *hirsutus*
 - DD. Surfaces of lvs. glabrous.
 - E. Blades linear-subulate, nearly terete. 6. *pectinatus*
 - EE. Blades linear-lanceolate, flat. 7. *heterotrichus*
 - AA. Floral lvs. much broader than the cauline, subimbricate.
 - B. Plants diffuse subshrubs with the flowering branches ascending.
 - C. Lvs. subterete. 8. *carnosus*
 - CC. Lvs. flat.
 - D. Surfaces of lvs. villous: lvs. linear. 9. *villosus*
 - DD. Surfaces of lvs. glabrous: lvs. usually subspatulate. 10. *striatus*
 - BB. Plants suberect little shrubs with the flowering branches rigid and erect: heads, dense, cone-like. 11. *capitatus*

1. *vulgaris*, Linn. COMMON THYME. Subshrub, erect, 6 in. high: sts. sometimes decumbent at base: branches stiff and woody, usually white-pubescent: lvs. sessile, 3-6 lines long, linear- or ovate-lanceolate, fascicled at the axils; floral lvs. lanceolate, obtuse: floral whorls lax interrupted spikes: fls. small, lilac or purplish, calyx-teeth of upper lip lanceolate, of lower subulate. S. Eu.—An old garden plant, being grown as a sweet-herb. The lvs. and shoots are used for seasoning. It is well to renew the plants from seeds every 2 or 3 years. There are varieties with broad and narrow lvs.

2. *Herba-barona*, Loisel. Subshrub, much branched, procumbent, glabrous below: flowering branches shortly ascending, 3-5 in. high: lvs. short-petioled, ovate-lanceolate, acute, base rotundate, viscid-glandular; floral lvs. rather similar: floral whorls approximate and capitate: fls. purplish; calyx white-pilose and red, glandular, upper lip trifid, lower teeth of calyx subulate and ciliate-barbed; corolla-tube slightly exerted. Corsica.

3. *Chamædrys*, Fries. Subshrub, low, forming a tuft: sts. diffuse, ascending: lvs. broad-oblong; petioles ciliate; floral-lvs. similar: fls. whorled or capitate, purple; calyx-teeth of upper lip 3, triangular, of lower lip 2, subulate. N. Eu.—Similar to *T. Serpyllum* and by most considered a form of that species, but said to differ in having the lvs. less narrowed to the petiole and only the petiole ciliate; also the lvs. are less prominently veined.

4. *Serpyllum*, Linn.; also spelled *Serpyllus* (*T. azoricus*, Lodd. *T. hirsutus*, Auth. not Bieb. *T. micans*,

Lowe). MOTHER OF THYME. CREEPING THYME. Perennial or subshrubby, cespitose or creeping: sts. wiry, prostrate and rooting below, ascending-erect above, slightly puberulent: lvs. elliptic, oblong or ovate, obtuse base more or less attenuate, seldom $\frac{1}{2}$ in. long, short-petioled: floral-whorls sessile, congested into a head or the lower more or less distant and racemose: fls. minute, lilac or rose; calyx more or less hairy, 2-lipped to the middle, teeth of upper lip triangular, glabrous or ciliate, of lower lip 2, lanceolate-subulate, ciliate; corolla-tube rather included. Temperate parts of Eu., Asia, and N. Afr. G.M. 57:807. L.B.C. 16:1530.—A common plant in old gardens, prized as an evergreen edging and as cover for rockwork and waste places; also run wild. The lvs. are sometimes used for seasoning, as are those of *T. vulgaris*. The nodes are short, making it a very leafy plant. Variable. Var. *albus*, Hort., is a white-fl. form. Gt. 45, p. 108. Var. *argenteus*, Hort., is a form with silver variegated lvs. commonly known in the trade as *T. citriodorus argenteus*, Hort. Var. *aureus*, Hort., is a form with golden variegated lvs. growing about 8-12 in. high; usually known in the trade as *T. aureus*, Hort., or *T. citriodorus aureus*, Hort.; there is also a minor variation known in the trade as *T. Serpyllum aureus marginatus*. Var. *Chaubardii*, Boiss. & Heldr., see *T. heterotrichus*. Var. *citriodorus*, Hort., see var. *vulgaris*. Var. *coccineus*, Hort. (*T. coccineus*, Hort.), grows about $1\frac{1}{2}$ -3 in. high, has dark green lvs. and bright crimson fls. Var. *lanuginosus*, Hort. (*T. lanuginosus*, Mill. *T. Chamædrys lanuginosus*, Hort.), is a low form, about 3 in. high with small roundish lvs. which are gray-pubescent; a good edging plant. Var. *montanus*, Benth. (*T. montanus*, Waldst. & Kit. *T. Chamædrys*, Auth. not Fries), is a form with the branchlets more erect and the lvs. larger than the type. Var. *pulchellus*, Hort., has the upper part of the calyx and its teeth purple. G.M. 56:83. Var. *splendens*, Hort., is a form with brilliant red (according to some bright purplish red) fls. Var. *variegatus*, Hort., has white-variegated lvs., possibly the same as var. *argenteus*. Var. *vulgaris*, Benth. (*T. Serpyllum* var. *citriodorus*, Hort. *T. citriodorus*, Schreb.). LEMON THYME. Lvs. smaller than the type and strongly veined; the plant has a decided lemon odor.

5. *hirsutus*, Bieb. Perennial or subshrub, cespitose and cushioned or procumbent: flowering branches ascending, hoary-pubescent: lvs. not punctate, sessile or nearly so, linear-subulate, obtuse, both surfaces hoary-tomentose, margin ciliate: fls. closely approximate in an oblong head, rose; calyx reddish, hirsute, 2-lipped below the middle, teeth of upper lip lanceolate, acuminate, of lower subulate; corolla-tube included. S. E. Eu. and Caucasus.

6. *pectinatus*, Fisch. & Mey. (*T. odoratissimus*, Bieb., not Mill.). Perennial, bush-like: young branches slender, erect, leafy: lvs. glandular-punctate, linear-subulate, obtuse, fascicled at the axils; floral lvs. similar: fls. pale purple, in heads; calyx equally 2-lipped almost to the middle, teeth of upper lip lanceolate, rather acute, of lower subulate; corolla-tube included. S. Russia and Asia Minor. G.M. 56:82. Gn. 78, p. 134.—Very closely related to *T. Serpyllum*. Strongly fragrant.

7. *heterotrichus*, Griseb. Subshrub, 3-6 in. high: branches ascending, puberulent: lvs. 6-8 lines long, linear-lanceolate, rather obtuse, fascicled in the axils, flat, glabrous; floral lvs. similar: floral whorls approximate in a head-like raceme: fls. pale violet; calyx pilose, upper lip trifid to the middle, its segms. lanceolate-acuminate. Greece and Macedonia. G.W. 12, p. 461.—Treated by some authors as *T. Serpyllum* var. *Chaubardii*, Boiss. & Heldr.

8. *carnosus*, Boiss. Subshrub, about 9 in. high: sts. decumbent at base, otherwise erect, white-pubescent: lvs. minute, fascicled, strongly revolute, fleshy, subterete, oblong, obtuse, glandular-punctate, glabrous,

glaucous; floral lvs. ovate, with revolute margins, hirtellous: heads dense, ovate: fls. white; calyx hirtellous, upper lip 3-toothed to hardly the middle, margin revolute; lower lip with bristle-like teeth. Portugal.

9. *villosus*, Linn. Subshrub, about 3 in. high: sts. much branched, erect, pubescent: lvs. narrow-linear, acute, ciliate, fasciated at the axils; floral lvs. broadly ovate, acuminate, villous: floral whorls in an ovate-globose spike: fls. purplish crimson; calyx villous, teeth of upper lip short, ovate-lanceolate, of lower subulate. Portugal.—Some of the material offered in the trade under this name may be a form of *T. Serpyllum*.

10. *striatus*, Vahl (*T. Zygis*, Sibth. & Smith, not Linn.). Subshrub, about 3 in. high: branches woody, procumbent; flowering branchlets erect, somewhat hirsute: lvs. stiff, sessile, linear or subspatulate, glabrous, more or less ciliate beneath; floral lvs. broadly cordate-ovate, striate and pubescent: fls. congested in a dense, ovate head with the uppermost lvs. forming an involucre, white (purple?); calyx-teeth lanceolate; corolla-tube rather included.

11. *capitatus*, Hoffmgg. & Link (*Coridothymus capitatus*, Reichb. f.). Subshrub, 6 in. to about 1 ft. high: branches stout and erect, sterile branches finally spiny: lvs. stiff, linear, very short, rather 3-sided: head ovate, dense, cone-like: fls. rose; calyx compressed at the margins, teeth ciliate; corolla-tube short-exserted. Medit. region.—Treated as a distinct genus, *Coridothymus capitatus*, by Briquet in Engler & Prantl, Pflanzenfamilien IV. 3a.

T. corsicus, Pers. = *Satureia corsica*.—*T. erectus*, Hort., is offered in the trade as a small shrubby evergreen about 9–12 in. high, with a rigid habit and clusters of rose or pale pink fls.—*T. ericifolius*, Roth = *Micromeria varia*, Benth. Subshrub, procumbent, pubescent or villous: lvs. sessile, lower ovate, upper lanceolate, somewhat canescent beneath: fls. minute, sessile in a sessile or peduncled fascicle; calyx usually purplish. Canary Isls.

F. TRACY HUBBARD.

THYRSACÁNTHUS (Greek, *thyrs* and *flower*). *Acanthaceæ*. Erect, glabrous, pubescent or villous herbs, which are adapted to the warmhouse. Lvs. opposite, entire, usually large: fls. red, fasciated at the bract-axils, pedicelled; fascicles or cymes arranged in a terminal thyrsoid, simple raceme or paniculately branched; calyx short, rather 5-parted, segms. narrow, acute or acuminate; corolla-tube elongate, straight or somewhat incurved, limb somewhat 2-lipped, 4-cleft; stamens 2, staminodia 2; disk rather thick: caps. oblong; seeds 4 or fewer by abortion.—About 23 species, Trop. Amer. The oldest and now accepted name of the genus is *Odontonema*.

O. Schomburgkianum, Kuntze (*Thyrsacanthus Schomburgkianus*, Nees. *T. rutilans*, Planch.). Fig. 3805. A shrubby plant, becoming 6 ft. high: lvs. oblong-lanceolate, nearly sessile: racemes 8–10 in. or even 3 ft. long from the upper axils, slender, drooping: fls. tubular, red, about 1½ in. long,

pendulous. Dec.–March. Colombia. B.M. 4851. R.H. 1852:160. Gn. 42, p. 482; 69, p. 209. F.S. 7:732. G. 20:177; 36:177. G.W. 4, p. 352; 11, p. 196.

O. callistachyum, Kuntze (*Thyrsacanthus callistachyus*, Nees. *T. lilacinus*, Lindl. *Justicia lilacina*, Hort.). Shrub, 2 ft. high: lvs. oblong, petioled, tomentose: fls. red; sepals pubescent, bristly-acuminate; corolla glabrous. Mex. J.F. 2:165.

F. TRACY HUBBARD.

THYRSÓPTERIS (Greek, *bunch* or *raceme* and *fern*; the fructification is disposed in racemose bunches). *Polypodiaceæ*. Tree-like fern: lvs. decompound, the fertile portions appearing like bunches of stipitate acorn-cups, the sterile portions twice-pinnate and then deeply pinnatisect. One species, Isl. Juan Fernandez, *T. elegans*, Kunze. Tree fern about 15 ft. high: lvs. decompound, reaching a length of 5–6 ft., one-third of which is naked; sterile portions bipinnate, with lanceolate incised pinnules; fertile parts tripinnate, each pinna becoming a raceme of stalked involucre: sori globose; involucre cup-shaped.

THYRSÓSTACHYS (Greek, *thyrs* and *spike*). *Gramineæ*. A genus of 2 species of arborescent bamboos native to Upper Burma and Siam, which has been referred to *Rottboellia* but is probably sufficiently distinct. The st.-sheaths are long, thin and persistent, with a long narrow blade. The lvs. are small or moderate-sized. *T. siamensis*, Gamble, is a tender, deciduous, "giant bamboo," with very graceful tufted sts. 25–30 ft. high and 1½–3 in. thick: st.-sheaths waved and truncate at the top, 9–11 x 4½–8 in.; auricles short-triangular: blade narrowly triangular: lvs. small, narrow, linear, 3–6 x ½–¾ in. Siam.—Once intro. in S. Calif., but it did not persist. Probably not now in cult. in this country outside test-grounds.

THYSANÒTUS (Greek, *fringed* and *ear*, alluding to the 3 inner perianth-segms. which are fringed). *Liliaceæ*. Perennials, suitable for the greenhouse. Rhizomes sometimes very short, sometimes stout and horizontal: lvs. radical, grass-like, flat or terete: scapes leafless, now erect and simple or paniculate above, now much branched or in one species twining: fls. sometimes densely fasciated, with 1 terminal fascicle or few at the top of the scape, sometimes variously panicled; perianth withering, persistent, segms. distinct, outer narrow, margin entire, inner with a broad colored margin, beautifully fimbriate-ciliate; stamens 6; ovary sessile or short-stipitate, 3-celled: caps. globose or ovoid.—About 21 species, Austral., one of which is also found in the Philippines and China. The difference in the inner and outer stamens and the absence of the latter in some species may not always be as constant as it would appear at first sight. The following species have been occasionally cult. They thrive in sandy loam and may be increased by offsets.

T. dichotomus, R. Br. (*T. intricatus*, Lindl. *T. tenuis*, Lindl., not Endl.). Rhizome thick; sts. very variable, sometimes erect, branched, 1–2 ft. high, rarely almost twining: lvs. radical, few, short: fls. 1 or 2, rarely 3, in terminal umbels; perianth-segms. purple; stamens 6. B.R. 24:50; 26:4. J.F. 4:402.—*T. juncus*, R. Br. Rhizome thick: sts. slender, loosely branched, erect or flexuous, 1–2 ft. high: lvs. radical, few, narrow-linear, short: fls. 1–3, in terminal umbels and sometimes 1 or 2 sessile along the lower branches; perianth-segms. purple, 5–6 lines long; stamens 6. B.M. 2351. B.R. 656.—*T. multiflorus*, R. Br. Rootstock densely tufted: lvs. all radical, densely tufted, erect, rigid, much shorter than the scape: scapes simple, 6–18 in. high, bearing a single terminal, many-fld. umbel or rarely a second one lower down: perianth-segms. purple, the outer very acute, inner rather shorter; stamens 3. Var. *prolifer*, Hort. (*T. proliferus*, Lindl.), is a luxuriant form, with a large terminal umbel, frequently a second rather lower down: the lvs. sometimes exceeding the scape. B.R. 24:8. F.S. 18:1911.—*T. tuberosus*, R. Br. (*T. elatior*, R. Br. *T. isantherus*, Lindl., not R. Br.). Roots swollen into tubers: lvs. radical, not numerous, narrow-linear, as long as the scape which is erect, rigid, terete and 6–12 in. (or more) high, branching into a loose, irregularly dichotomous panicle, each branch bearing a terminal 1–4-fld. umbel and sometimes a lateral sessile one: perianth purple, sometimes 6–7 lines long; stamens 6. B.R. 655.

F. TRACY HUBBARD.

3805. *Odontonema* (*Thyrsacanthus*) *Schomburgkianum*. (×½)

TIARÉLLA (Latin, *a little tiara or turban*; in reference to the form of the pistil). *Saxifragaceæ*. FALSE MITREWORT. Slender erect hardy perennial herbs, useful for the wild-garden or any shaded spot.

Leaves several, radical, long-petioled, simple or 3-foliate; stipules small, adnate to the petiole; raceme terminal, somewhat bracteate, simple or compound; fls. white or reddish; calyx-tube short, lobes 5, ovate; petals 5, entire; stamens 10; ovary superior, compressed, 1-celled: caps. membranaceous, 1-celled, 2-valved.—About 8 species, 1 from Japan, 1 from the Himalayas, the remainder from N. Amer. These plants are little grown, but

3806. *Tiarella cordifolia*. ($\times \frac{1}{4}$)

they are useful for colonizing or perhaps for the rock-garden and are particularly attractive in the autumn on account of their brilliant lf.-coloring. Prop. by division.

A. *Lvs. simple*.

B. *Petals oblong*.

cordifolia, Linn. FOAM-FLOWER. Fig. 3806. A handsome native perennial, forming a tufted mass, 6-12 in. high, of broadly ovate lobed and serrate lvs. and simple erect racemes of white fls. borne well above the foliage in May. Fls. about $\frac{1}{4}$ in. across; petals oblong, clawed, somewhat exceeding the white calyx-lobes. In rich, moist woodland, Nova Scotia to Ont., south to Ga. Gn. 22, p. 21; 32, p. 511; 53, p. 456; 55, p. 40; 66, p. 87. V. 11:35. G.L. 26:153. C.L.A. 4:340. G. 6:27; 10:144; 12:127; 17:464. Gn.M. 1:188. Gn.W. 21:893. J.H. III. 54:423.—An elegant plant well worthy of general cult. It is a lover of cool shaded places and of rich moist soil. It will do well, however, in ordinary soil and flower freely in a half-shaded place, but the varied lf.-markings of bronzy red and other signs of luxuriance are not brought out to their fullest extent except with moisture, coolness and a fairly rich soil. The plant forces well and easily in a coolhouse for early spring flowering. It is tenacious of life and generally easy to manage. Var. *albiflora*, Hort., is a fine white-fl. form. Var. *purpurea*, Hort. (*T. purpurea*, Hort.), is a purple-fl. form, of which the following variations are also offered in the trade: *purpurea major*, with salmon-rose or wine-red fls.; *purpurea major compacta*, a more compact grower with bronzy chamois-colored fls.; *purpurea marmorata*, with very attractive bronze foliage passing to blackish green and marbled with purple: fls. very numerous, maroon.

BB. *Petals filiform, inconspicuous*.

unifoliata, Hook. Hardy perennial: lvs. thin, rounded or triangular, 3-5-lobed, the lobes crenate-toothed; st.-lvs. usually only 1, rarely 2-3: panicle loose; petals small. W. Amer.—The lobing of the lvs., according to Bot. of Calif., varies so that it may pass into the next species.

AA. *Lvs. 3-foliate*.

trifoliata, Linn. Resembling *T. unifoliata* except in having 3-foliate lvs. Ore. to Alaska, also N. W. Asia. *T. biternata*, Vent.=*Astilbe biternata*.

F. W. BARCLAY.

F. TRACY HUBBARD.†

TIBOUCHINA (native name in Guiana). Including *Pleroma*. *Melastomaceæ*. Shrubs or subshrubs, rarely herbs, sometimes climbing, usually strigose-pilose or hispid, adapted to the warmhouse or to out-of-doors in the extreme South.

Leaves usually large, leathery, petioled, ovate or oblong, entire, 3-7-nerved: fls. generally in trichotomous terminal panicles, large, violet or purple, rarely 4-merous; calyx hirsute or strigose, tube ovoid, campanulate, urn-shaped or elongated, lobes 5, subulate, lanceolate or oblong; petals 5, obovate; stamens 10; ovary free or adhering toward the base to the 5 calyx-ribs, 5-celled: caps. 5-valved.—About 215 species, Trop. Amer., but chiefly from Brazil.

Tibouchinas are among the handsomest of our intermediate greenhouse plants, and can be readily trained in bush form, probably with the exception of *T. semidecandra*, which is better adapted as a pillar or trellis plant. These plants may be propagated at any time of the year, but early spring is the best season. Small pots should be half filled with sandy loam, the remainder being all sand and the cuttings inserted singly. They should be kept quite close and fairly moist, and they will root in a few weeks. After they are rooted, place them in a greenhouse with a night temperature of about 55°, allowing a rise of 20° in the middle of the day. Pinch the heart out as soon as they begin to grow, and a few days after they have been cut back, move them into a pot about 3 inches larger. A good fibrous loam may now be used for all future pottings, and as the plants get stronger about a third of sheep-manure may be added, also a little sharp sand and charcoal, to keep the soil sweet and porous. Give plenty of light at all times, but avoid strong sunshine. Give plenty of water, and syringe the under side of the foliage to prevent red-spider, which is about the only insect that is trouble-

3807. *Tibouchina semidecandra*. ($\times \frac{1}{4}$)

some. Never allow the plants to become pot-bound until the size desired for flowering is attained. Give strict attention to keeping the plants in shape, by pinching the strong shoots, and tying them to the outer edge of the plants, allowing the weaker ones to grow, and fill up the middle of the plant. In summer the plants may be placed out-of-doors, and plunged to the rim of the pot, in a bed of ashes; but never allow the sun to strike them directly, as it will disfigure the foliage. These plants are excellent for exhibition purposes and conservatory decoration. The species *T. elegans* and *T. semidecandra* are worthy of general cultivation. (George F. Stewart.)

semidecandra, Cogn. (*Lasiandra macrantha*, Lind. & Seem. *Pleroma macranthum*, Hook.). Fig. 3807. A tender shrub: lvs. ovate or oblong-ovate, 2-6 in. long, round at the base, short-petioled, densely setose above, villous beneath, not foveolate, 5-nerved or 3-nerved: bracts broadly suborbicular, somewhat rounded at the apex and shortly apiculate, margin not translucent: fls. reddish purple to violet, often 5 in. across, solitary and terminal or 1 fl. terminal and 2 in the upper axils on the branchlet; stamens purple; style setulose. Brazil. B.M. 4412 (as *P. Kunthianum*); 5721. F.S. 23:2430. Gn. 44:120. F. 1868:193. I.H. 16:594. G. 29:34. G.W. 7, p. 390. G.Z. 15:1. J.H. III. 42:219. H.F. II. 10:72. Var. *floribunda* is more suited to pot cult. and flowers more freely than the type when small. *Lasiandra*, or *Pleroma splendens*, Hort., should be compared with this. The fls. of *T. semidecandra* last but a day or so, but the flowering season lasts for several weeks. Plants may also be used for summer bedding. They are seldom out of bloom. The species is much esteemed in Fla., where it makes a showy shrub 8 ft. high. It endures a few degrees of frost with impunity, and even if cut down it sprouts readily.

élegans, Cogn. (*Pleroma elegans*, Gardn.). Tender shrub, 3-6 ft. high: lvs. rigid, fragile, oblong or ovate-oblong, 3-nerved: fls. purple, 1½ in. across; calyx more or less armed with rigid spreading bristles which are thickened at the base. Brazil. B.M. 4262. P.M. 15:27. F.S. 12:1212 (as *Lasiandra elegans*). H.F. 3:24.

There is a plant offered in the trade under the name of *Pleroma candidum*, Hort. Bull, described as being a shrub with dark green ovate-lanceolate lvs., densely silky-hairy, the 5 longitudinal veins very prominent beneath: fls. snowy white, about 1½-1¾ in. across, borne in loose terminal heads. Said to have been intro. from S. Austral. As there are no Tibouchinas known outside of S. Amer. it is not likely that this is correctly placed in *Pleroma*; the proper identification of the plant is at present impossible.—*T. lepidota*, Baill. (*Lasiandra lepidota*, Naud.), is a plant which has been much confused and is still uncertain. F.W. 1874:289.—There is a plant at least formerly cult. under the name of *Pleroma sarmentosum*, Hook. Small villous shrub with the branches and branchlets sarmentose: lvs. short-petioled, ovate or oblong, acute, base rounded or cordate, 7-nerved, pilose: fls. blue, about 2 in. across; calyx-tube obovoid or subglobose, densely tomentose; petals cuneate-obovate. Peru. Its position and name in Tibouchina are uncertain. B.M. 5629. F.W. 1869:225.—*T. stenocarpa*, Cogn. Shrub with acutely 4-angled branches which are sometimes somewhat winged: lvs. short-petioled, usually oblong, base generally short-attenuate, 5-nerved, silky villous: fls. many in a terminal panicle, usually rather large, purple or violet-purple; calyx-tube campanulate; petals narrowly obovate-cuneate. Brazil.

F. TRACY HUBBARD. †

TIEDEMANNIA: *Orypolis*.

TIGER-FLOWER: *Tigridia*. T. Lily: *Lilium tigrinum*.

TIGRIDIA (*tiger-like*, referring to the peculiarly marked flowers). *Iridaceæ*. Bulbous plants, grown in the greenhouse and also making very showy summer-blooming subjects.

Bulbs tunicated: st. erect, mostly unbranched, 1-2½ ft. tall, with a few narrow plicate lvs. at the base and 2 or 3 smaller ones higher up: spathes 1 or 2, leaf-like, each bearing 1 or few blossoms: fls. in shades of yellow, orange or purplish, variously spotted, often very showy; perianth wide-spreading, with no tube, the segms. 6, in 2 dissimilar series, connivent into a broad cup at the base; stamens 3, the filaments united into a

long cylindrical tube including the style; pistil with 3-loculed ovary, long style with 3 2-parted branches.—About 13 species from Mex., Cent. Amer., Peru, and Chile. *T. Pavonia*, from S. Mex., was in cult. in Eu. in the 16th century. L'Obel described it in 1576. The younger Linnæus referred it to the genus *Ferraria*, and some of the *tigridias* are yet cult. under that name. *Ferraria*, however, is a S. African genus, and all the parts of the perianth are nearly equal. *T. Pavonia* is cult. in many forms, and is the only common species in gardens. The fls. of all *tigridias* are fugitive, lasting only for a day.

Tigridias are tender "bulbs" requiring the treatment given gladiolus. Plant in well-prepared soil when settled weather comes, 2 to 3 inches deep and 4 to 8 inches apart. The principal blooming period is July and August. Allow the corms to remain in the ground until danger of frost approaches, then store in a dry place

where dahlias or gladioli will keep. See that the corms are dry before being placed in storage. Propagation is by cormels and seeds. The best colors are secured in warm weather.

3808. Tiger-flower.—*Tigridia Pavonia*. (×¼)

A. Fls. large (often 4 in. or more across); the 2 rows of perianth-segms. very dissimilar; stigmas decurrent. (*Tigridia* proper.)

Pavonia, Ker-Gawl. **TIGER-FLOWER**. **SHELL-FLOWER**. Fig. 3808. Erect, usually unbranched, 1½-2½ ft. tall, glabrous, with several sword-shaped, strongly plicate long-pointed lvs., the spathe-lvs. 3-5 in. long: fls. produced in succession through the warm season, very large and showy, in some forms 5-6 in. across, oddly marked, with a cup-shaped or saucer-shaped center and wide-spreading limb formed by the obovate outer

segms. which are bright red on the limb, and purple, yellow, or red-spotted on the claw; inner segms. panduriform (fiddle-shaped), about half the length of the outer ones, the blade ovate-acute, orange-yellow, and copiously spotted. Mex. and Guatemala. B.M. 532 (as *Ferraria Tigridia*). I.H. 38:142. G.C. III. 55, suppl. Feb. 21. Gn. 64, p. 56. G.W. 11, p. 290; 14, p. 674. R.B. 26:73. Var. *conchiflora*, Hort. (*T. conchiflora*, Sweet), has bright yellow fls. Var. *Watkinsonii*, Hort. (var. *aurea*, Hort. *T. conchiflora* *Watkinsonii*, Paxt.). Raised from seeds of var. *conchiflora* pollinized by *T. Pavonia*, before 1840, by J. Horsfield, Manchester, England. Horsfield is quoted as follows by Paxton: "In habit and strength this hybrid resembles *T. Pavonia*, the male parent; but in color and the markings of the flower it resembles *T. conchiflora*, the female parent; the large outer sepals, however, are of a very deep yellow, inclining to orange, and sometimes elegantly streaked with red lines; whilst the spotted center equals, if not surpasses, the brilliancy of either of the species. One of its greatest merits is being so free a bloomer, and as easy to cultivate and increase as *T. Pavonia*, whereas *T. conchiflora* is rather delicate, increases slowly, and is easily lost." Dutch bulb-dealers may still offer it. P.M. 14:51. Var. *alba*, Hort., has white fls., with red spots in the throat. G.L.

26:128 (as *T. alba*). Var. *álba immaculata*, Hort., is a spotless white variety, a sport from var. *alba*. Gn. 49, p. 361. Var. *fláva*, Hort., has pale yellow fls. with red-spotted center. Gn. 50:22. Var. *canariensis*, Hort., is also a pale yellow-fl. form, but named as if an inhabitant of the Canaries. Var. *lutea immaculata*,

Hort., has pure yellow spotless fls. Var. *rosea*, Hort., has rose-colored fls. with yellow variegated center. Var. *lilacea*, Hort., has lilac fls. with spotted center. Gn. 45:26. Var. *speciosa*, Hort., is a partially dwarf form with deeper red color, the interior of the cup being similar in color to the limb. Described in 1843. G. 36:359. Var. *grandiflora*, Hort., has fls. much like those of *T. Pavonia* itself except that they are larger and brighter colored. Gn. 45, p. 263. G. 1:20; 6:263 (as *T. grandiflora*). Identical with this, or subtypes of it, are the forms known as *Wheeleri*, *coccinea*, *splendens*. Most of the marked departures in colors of *T. Pavonia* are recent. In catalogues the above names often appear as if they were species names.

3809. *Tigridia Pringlei*. (× $\frac{1}{2}$) Pringlei, Wats. Fig. 3809. Distinguished by Sereno

Watson, the author of the species, as follows: "Very closely related to *T. Pavonia*, and if color alone were to decide, it might be considered a variety of it, though differing markedly even in that respect from the old species. The base of the sepals is blotched (rather than spotted) with crimson, with a border of orange, the reflexed blade being of a bright scarlet-red. The petals have the base blotched and coarsely spotted with crimson, with a well-defined, deeper-colored, brownish margin, the blade orange, tinged with scarlet, but not at all spotted as in *T. Pavonia*. The more essential difference is in the form of the petals, which have a broadly cordate or reniform base, with a much narrower small triangular-ovate acute blade. The sepals are also smaller and more oblong in outline." N. Mex. G.F. 1:389 (adapted in Fig. 3809). B.M. 7089.

AA. Fls. relatively small; the 2 rows of segms. differing less in size; stigmas capitate, or at least not strongly decurrent. (Subgenus *Beatonia*.)

buccifera, Wats. Fig. 3810. About 1 ft. high, slender, branching, glaucous: lvs. very narrow, strongly plicate: fl. 2 in. across, the cup pale greenish yellow, dotted with purple, the obovate obtuse blade of the outer segms. light purple; inner segms. "folded together in such a manner as to form a sunken longitudinal tube down the center, the dilated sides at the outer end of the tube approaching each other in the form of 2 cheek-like prominences,—these are colored white, purple, and yellow, while the small rounded terminal blade is a deep purple." Mountains of Jolisco, Mex. G.F. 2:413 (adapted in Fig. 3810).—Offered in 1889 by Horsford.

T. aurea, Hort., is *Cypella plumbea*.—*T. caléstiti*, Hort., is *Cypella plumbea*.—*T. Houttei*, Roelz., is *Hydrotania Van Houttei*.—*T. Meleagris*, Hort., is also a *Hydrotania* (*H. Meleagris*, Lindl.), but is not in the American trade. B.R. 28:39.—*T. violacea*, Schiede. & Schlecht. One of the *Beatonia* section: slender, narrow-lyd.: fls. 2 in. across, violet, spotted at the base; inner segms. small, cusp-pointed. Mex. B.M. 7356. H.U. 3, p. 301. Other kinds of *Tigridia* are likely to appear in cult.

L. H. B.

TÍLIA (the classical Latin name). *Tiliaceæ*. LINDEN. LIME. BASSWOOD. WHITEWOOD. Ornamental trees, grown for their handsome foliage, good habit, and also for their fragrant flowers.

Deciduous: winter buds large, obtuse, with several imbricate scales, terminal bud wanting: lvs. alternate, petioled, usually cordate, serrate, with caducous stipules: fls. small, in long-peduncled drooping cymes; the peduncle for about half its length adnate to a membranous ligulate bract; sepals 5; petals 5, often with 5 opposite petaloid stamnodes; stamens many, with the filaments forked at the apex; ovary superior, 5-celled; style slender, with 5-lobed stigma: fr. globose or ovoid, nut-like, usually with 1-3 seeds.—About 25 species throughout the temperate regions of the northern hemisphere, in N. Amer. south to the highlands of Mex., except W. N. Amer., and in Asia south to Cent. China. The names of the lindens, and particularly of those in cult., have been much confused, owing to the great variability of some species, the rather slight differences between many of the species and to the presence of many hybrids originated spontaneously and in cult. The light-colored soft and light wood is easily worked and much used for the interior finish of houses, for wood-carving, wooden baskets and other small wooden ware. The tough inner bark is used as a tying material and, particularly in Russia, in the manufac-

3810. *Tigridia buccifera*. (×nearly $\frac{1}{2}$)

ture of mats, cords, shoes, and other articles. The fls. yield large quantities of nectar and afford an excellent bee pasture, except *T. tomentosa* and *T. petiolaris*, which are poisonous to bees.

The lindens are very desirable trees of comparatively rapid growth and regular pyramidal habit while young, with slender-stalked medium-sized or rather large leaves and with small yellowish fragrant flowers in

drooping clusters followed by small inconspicuous nutlets. The species in cultivation are nearly all hardy North and not particular as to the soil, but do not thrive well in dry locations or in dry climates. They are much planted as shade and ornamental trees and, particularly in Europe, are favorite avenue and street trees. The best for avenue planting are *T. tomentosa*, *T. euchlora*, *T. americana*, *T. cordata*; *T. tomentosa* stands heat and drought better than any of the others, while *T. platyphyllos*, although often planted for its rapid growth, is likely to suffer in dry seasons or in dry localities.

Propagation is by seed which must be sown soon after ripening or stratified, as it does not germinate until the second year if kept dry and sown in spring. Also increased by layers; in layering usually the method of

3811. *Tilia platyphyllos*. ($\times \frac{1}{2}$)

"stooling" is employed; this consists of cutting a younger tree close to the ground and of laying down and covering partly with earth the numerous shoots which will appear. Varieties or rarer species are often grafted in spring or budded in August on common stock. Plants raised from layers or grafts remain often one-sided for many years, as the lateral branches usually employed for propagation have the tendency to grow horizontally instead of strictly upright.

KEY TO THE SPECIES.

- A. Lvs. green or glaucous beneath, glabrous or pubescent with simple hairs.
- B. Under side of lvs. and branchlets pubescent: fls. without staminodes. 1. *platyphyllos*
- BB. Under side of lvs. glabrous except axillary tufts of hairs.
- C. Axillary tufts present at the base of the lf. and elsewhere.
- D. Margin of lvs. finely serrate: fls. without staminodes.
- E. Lvs. green beneath; the tertiary veins prominent.

- F. Upper surface of lvs. dull green, margin with short-pointed teeth. 2. *vulgaris*
- FF. Upper surface glossy dark green, margin with long-pointed teeth. 3. *euchlora*
- EE. Lvs. glaucous beneath; the tertiary veins not prominent.
- F. Cymes 5-11-fld.: fls. without staminodes. 4. *cordata*
- FF. Cymes 8-40-fld.: fls. with staminodes. 5. *japonica*
- DD. Margin of lvs. coarsely serrate, lvs. often 3-lobed: fls. with staminodes. 6. *mongolica*
- CC. Axillary tufts of hairs wanting at the base, present elsewhere: lvs. 4-5-in. long: fls. with staminodes. 7. *americana*
- AA. Lvs. with stellate hairs or stellate tomentum beneath: fls. with staminodes.
- B. Branchlets glabrous.
- C. Axillary tufts of hairs present on the grayish green or grayish under side of the lvs. 8. *neglecta*
- CC. Axillary tufts of hairs wanting, under side white or whitish.
- D. Under side of lvs. densely white-tomentose.
- E. Size of the ovate or ovate-oblong lvs. 4-7 in., margin sharply serrate. 9. *heterophylla*
- EE. Size of the orbicular-ovate lvs. 2-4 in., margins sinuately serrate. 10. *Oliveri*
- DD. Under side of lvs. thinly grayish tomentose or stellate-pubescent, usually with long hairs on the veins. 11. *spectabilis*
- BB. Branchlets pubescent.
- C. Without axillary tufts of hairs on the lvs. beneath.
- D. Shape of lvs. orbicular-ovate, the white tomentum persisting.
- E. Tomentum of branchlets, buds, and petioles grayish or whitish; margin of lvs. finely serrate with short-pointed teeth.
- F. Habit upright: petioles shorter than half the blade: fr. slightly 5-angled. 12. *tomentosa*
- FF. Habit pendulous: petioles longer than half the blade: fr. 5-furrowed. 13. *petiolaris*
- EE. Tomentum of branchlets, buds, and petioles yellowish or brownish: margin of lvs. coarsely serrate with long-pointed teeth. 14. *mandschurica*
- DD. Shape of lvs. ovate or triangular-ovate: lvs. irregularly and coarsely serrate with short-pointed teeth, often glabrescent with age. 15. *Miqueliana*
- CC. With axillary tufts of hairs; lvs. orbicular-ovate, grayish-tomentose beneath, brownish on midribs and nerves. 16. *Maximowicziana*

1. *platyphyllos*, Scop. (*T. grandifolia*, Ehrh. *T. europæa*, Linn., in part). LARGE-LEAVED LIME. Fig. 3811. Tree, to 120 ft.: young branchlets pubescent, older glabrous: lvs. orbicular-ovate, abruptly acuminate, obliquely cordate at the base, regularly serrate, dull green and short-pubescent or glabrous above, light green and pubescent beneath, 3-4 in. long; petioles stout, hairy: fls. in usually 3-fld. pendulous cymes; petals oblancheolate, longer than sepals; stamens 30; style glabrous: fr. globose, ovoid or pyriform, 3-5-ribbed, apiculate, tomentose, thick-shelled. June; the earliest species to bloom. Eu. G.F. 2:256 (adapted in Fig. 3811). H.W. 3:42, p. 24, 25. R.F.G. 6:316, 317, 318.—Very variable; some of the most important varie-

ties are the following: Var. *pyramidalis*, Kirchn. Of narrow pyramidal habit. M.D.G. 1898:161. Var. *corallina*, Dipp. (var. *rùbra*, Hort.). Young branches red. Var. *aùrea*, Kirchn. Young branches golden yellow. Var. *laciniàta*, Henry (var. *asplenifolia*, Kirchn. var. *filicifolia*, Hort. *T. europæa* var. *laciniàta*, Loud.).

Lvs. deeply and irregularly cut. G.W. 15, p. 662. Var. *vitifolia*, Simonkai. Lvs. slightly 3-lobed or indistinctly lobed.—This species is the strongest grower and in this country often sold as *T. europæa*. It is more impatient of drought than most other species and therefore not to be recommended as a street tree.

2. *vulgàris*, Hayne (*T. intermedia*, DC. *T. europæa*, Linn., in part). COMMON LINDEN. Fig. 3812. Tree, to 120 ft.: young branchlets glabrous: lvs. broadly ovate, abruptly acuminate, obliquely cordate or

3812. *Tilia vulgaris*. ($\times \frac{1}{2}$)

truncate at the base, serrate with short-pointed teeth, dark green above, light green beneath, glabrous except axillary tufts of hairs, 3-4 in. long; petiole about half as long as the blade: fls. 5-10, similar to those of the preceding species: fr. ovoid or globose, apiculate, tomentose, thick-shelled. June, July; a week or 10 days later than the preceding species. G.F. 2:256 (adapted in Fig. 3812). R.F.G. 6:313. M.D.G. 1904:188, 189.—Supposed to be a spontaneous hybrid of the preceding species and *T. cordata*. This is one of the best species for general planting and fine old trees of it are occasionally seen in this country.

3. *euchlòra*, Koch (*T. dasystyla*, Kirchn., not Stev. *T. rubra* var. *euchlòra*, Dipp.). CRIMEAN LINDEN. Tree, to 50 ft.: young branchlets glabrous, green: lvs. orbicular-ovate, abruptly acuminate, obliquely cordate at the base, regularly serrate, the teeth with slender points, dark glossy green above, paler beneath and glabrous except axillary tufts of brown hairs, 2-3 in. long; petiole slender, more than half as long as the blade: fls. 3-7, in pendulous cymes; style pubescent near the base: fr. ovoid, slightly 5-ribbed, tomentose, thick-shelled. July. M.D.G. 1901:381, 540.—Supposed to be a hybrid of *T. caucasica*, Rupr., and *T. cordata* and seems to occur spontaneously in the Caucasus and

Transcaucasia. It is one of the most beautiful lindens on account of its dark green glossy foliage. It is usually prop. by budding.

4. *cordàta*, Mill. (*T. ulmifolia*, Scop. *T. parvifolia*, Ehrh. *T. microphylla*, Vent. *T. silvestris*, Desf. *T. europæa*, Linn., in part). SMALL-LEAVED LINDEN. Fig. 3813. Tree, to 100 ft.: young branchlets at first slightly pubescent, soon glabrous: lvs. suborbicular, often broader than long, cuspidate, cordate at the base,

3813. *Tilia cordata*. ($\times \frac{1}{2}$)

regularly serrate with short-pointed teeth, dark green and somewhat lustrous above, glaucous and glabrous beneath with brown axillary tufts, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. long; petioles about half as long as blade: fls. 5-7 in nearly upright cymes; style glabrous: fr. globose, slightly ribbed, apiculate, tomentose, with thin fragile shell. July. Eu. G.F. 2:257 (adapted in Fig. 3813). H.W. 3:41, pp. 21, 22. R.F.G. 6:311, 312. M.D.G. 1904:188. Var. *pyramidalis*, Wittm. Of narrow pyramidal habit.

5. *japònica*, Simonkai (*T. cordata* var. *japònica*, Miq.). Tree, to 60 ft.: young branchlets slightly pubescent at first: lvs. suborbicular, almost like those of the preceding species, 2-3 in. long; petioles usually longer than half the blade: fls. 7-40, in pendulous cymes; staminodes present: fr. ovoid, not ribbed, tomentose, thin-shelled. July. Japan. S.I.F. 1:72.

6. *mongòlica*, Maxim. Small tree, to 30 ft.: young branchlets glabrous, reddish: lvs. suborbicular, or ovate, acuminate, subcordate or truncate at the base, coarsely serrate and usually 3-lobed, dark green and shining above, glaucescent beneath, glabrous except axillary tufts, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. long: fls. 6-12 in a cyme; the bract stalked; staminodes present; style glabrous: fr. ovoid, mucronulate, tomentose, thick-walled. July. Mongolia, N. China. R.H. 1902, p. 476. S.T.S. 1:61.

3814. Basswood, or American linden.—*Tilia americana*. ($\times \frac{1}{4}$)

—Very distinct with its small coarsely serrate, birch-like lvs. reddish when unfolding; it flowers when only a few feet high.

7. *americàna*, Linn. (*T. glàbra*, Vent.). Fig. 3814. Tree, to 120 ft.: young branchlets glabrous, green: lvs. broadly ovate, abruptly acuminate, cordate or truncate at the base, coarsely serrate, the teeth long-pointed, dark green above, light green beneath with tufts of hairs in the axils of the lateral veins, but wanting at the base, 4-6 in. long, turning yellow in autumn: cymes pendulous, many-fl.: bract stalked, tapering toward the base: staminodes present: fr. ovoid or globose, without ribs, tomentose, thick-shelled. July. Canada, south to Va. and Ala., west to N. Dak., Kans., and E. Texas. S.S. 1:24. Mn. 6:153. Var. *macrophylla*, Hort. (var. *mississippiensis*, Hort.). A large-lvd. form. —This species is frequently planted as an avenue tree. Its wood is much used in the manufacture of wooden-

ware, cheap furniture, panels of carriages, and also of paper pulp.

8. *neglecta*, Spach (*T. Michauxii*, Sarg., not Nutt. *T. pubescens*, Hort., not Vent.). Tree, to 80 ft.: branchlets glabrous, red; lvs. broadly ovate or ovate, acuminate, obliquely cordate at the base, rarely truncate, coarsely serrate, with long-pointed, usually incurved teeth, dark green and glabrous or sparingly pubescent above, more or less stellate-pubescent and grayish green beneath with conspicuous axillary tufts, 5-6 in. long, turning yellow in autumn; cymes many-fl.; bract decurrent nearly to the base, tomentulose above; peduncle glabrous; fr. subglobose or ovoid, slightly furrowed, tomentose. July. E. Canada to Ga. and Texas west to Ohio. S.M. 673.—This species has often been confused with *T. pubescens* and with *T. heterophylla*.

9. *heterophylla*, Vent. (*T. alba*, Michx. *T. Michauxii*, Nutt.). Tree, to 60 ft.: young branchlets glabrous and red; lvs. broadly ovate to oval-ovate, short-acuminate, obliquely truncate or cordate at the base, finely serrate with rather short-pointed teeth, dark green and glabrous above, white-tomentose beneath without axillary tufts, 4-7 in. long; fls. in many-fl. pendulous cymes; bract decurrent often nearly to the base, rather large; fr. subglobose, tomentulose. June. W. N. Y. to Ala. and Ill. S.S. 1:27.—This is a very handsome linden with its large lvs. silvery white below and is sometimes sold as *T. macrophylla*.

10. *Óliveri*, Szyszylowicz. Tree, to 50 ft.: young branchlets reddish brown, glabrous; lvs. ovate, short-acuminate, cordate or truncate at the base, sinuately denticulate, with short gland-tipped teeth, dark green and glabrous above, white-tomentose beneath, without axillary tufts, 3-5 in. long; petioles glabrous; fls. about 20, in pendulous cymes; bract sessile; pedicels short, thickened; fr. globose, tomentose and tuberculate, apiculate, thick-shelled. Cent. China.—This recently intro. species promises to be a handsome ornamental tree.

11. *spectabilis*, Dipp. (*T. alba spectabilis*, Hort. *T. Blechnana*, Hort.). Hybrid of *T. americana* and *T. petiolaris* or *T. tomentosa*. Tree of vigorous growth: branchlets glabrous or slightly pubescent at first; buds pubescent toward the top; lvs. similar to those of *T. americana*, ovate, slightly grayish tomentose beneath, with long hairs on the veins, without axillary tufts, 4-6 in. long, 3-5 in. wide; infl. and size of fls. like those of *T. americana*, but tomentose though less densely than *T. tomentosa*. Blooms 2 or 3 weeks earlier than *T. tomentosa*. Of unknown origin; a similar form was raised from seed of *T. petiolaris* at the Arnold Arboretum in 1900. Var. *Móltkei*, Rehd. (*T. Moltkei*, Spaeth). Branchlets and buds quite glabrous; lvs. often without long hairs on the veins, 6-7 in. long. Originated at Spaeth's nursery near Berlin, Germany.

12. *tomentosa*, Moench (*T. argentea*, DC. *T. alba*, Ait. *T. alba pyramidalis*, Hort.). WHITE LINDEN. Tree, to 100 ft. with upright branches: young branchlets stellate-tomentose; lvs. nearly orbicular, abruptly acuminate, truncate or cordate at the base, serrate or doubly serrate, often lobulate, with short-pointed teeth, sparingly pubescent above, white-tomentose beneath, 3-5 in. across; petiole pubescent, less than half of the length of the blade; fls. 7-10, in pendulous tomentose cymes; fr. ovoid, slightly 5-angled, tomentose; shell woody. July. E. Eu., Asia Minor. R.F.G. 6:324. H.W. 3:43, p. 26. F.E. 14:1154, pl. 39. G.W. 8, p. 617. M.D.G. 1903:190; 1904:189.—This is a very handsome tree of dense habit with upright branches; it stands heat and drought better than any of the other species. Its fls. and those of the following species have proved poisonous to bees.

13. *petiolaris*, Hook. f., not DC. (*T. tomentosa* var. *petiolaris*, Kirchn. *T. alba*, Koch. *T. americana pen-dula*, Hort.). WEEPING WHITE LINDEN. Tree, to 80 ft., with slender pendulous branches: young branchlets tomentose; lvs. similar to those of the preceding species, but more finely and regularly serrate and petioles slenderer, longer than half the blade; fls. also like those of *T. tomentosa*: fr. globose, depressed at the apex, with 5 furrows, tomentose; seeds often imperfect. G.L. 19:257. Gng. 5:210; 15:291. Gn.W. 22:35 (suppl. Jan. 14). G. 34:687. M.D.G. 1901:163. B.M. 6737.—Known only in cult. and probably a variety of the preceding species.

14. *mandshurica*, Rupr. & Maxim. Tree, to about 60 ft.: young branchlets and buds with brownish tomentum; lvs. orbicular-ovate, short-acuminate, usually cordate at the base, coarsely serrate with long-

3815. *Tilia Maximowicziana*.
(Xnearly $\frac{1}{2}$)

pointed teeth, sparingly pubescent above, white-tomentose beneath, 4-6 in. long; petiole about half as long as the blade, tomentose; fls. 7-10, in pendulous cymes covered with brownish tomentum; fr. globose, tomentose, with 5 distinct ribs toward the base or without ribs. N. China, Manchuria, Korea.—Similar to *T. tomentosa*, from which it differs in the larger lvs. with long-pointed teeth and in the fr. Like the two following species still rare in cult.

15. *Miqueliàna*, Maxim. Tree, to 40 ft.: young branchlets finely tomentose; lvs. ovate or deltoid-ovate, usually much longer than broad, acute or acuminate, obliquely cordate at the base, coarsely serrate with broad mucronate teeth, dark green and glabrous or nearly so above, grayish tomentose beneath, without axillary tufts of hairs, 2½-5 in. long; fls. 10-20 in pendulous tomentose cymes; stamens 60-75; style shorter than petals, hairy at the base; fr. subglobose, tomentose, 5-ribbed at the base. Cult. in Japan; native habitat unknown. S.I.F. 1:72.

16. *Maximowicziana*, Shirasawa (*T. Miyabei*, Jack. *T. Miqueliàna*, Sarg., not Maxim.). Fig. 3815. Tree, to 100 ft.: young branchlets tomentose; lvs. broadly ovate or orbicular-ovate, abruptly acuminate, obliquely cordate at the base, coarsely serrate with broad mucro-

nate teeth, dark green above and pubescent at first, finally glabrous or nearly so, grayish tomentose beneath with brownish axillary tufts of hairs, finally often becoming partly glabrous, 3-6 in. long; petiole stout, less than half the length of the blade; fls. small, 10-18 in. pendulous tomentose cymes; style exserted: fr. globose, 5-ribbed, tomentose, thick-walled. Japan. S.I.F. 2:50. G.F. 6:113 (adapted in Fig. 3815).

T. caucásica, Rupr.—*T. rubra*.—*T. corinthiaca*, Bosc.—*T. rubra*, DC.—*T. Henryana*, Szyszyl. Tree, to 50 ft.: branchlets pubescent at first: lvs. broadly ovate, obliquely cordate or truncate, with bristly teeth, brownish tomentose beneath, with axillary tufts of hairs, 2-5 in. long; fls. 20 or more in a cyme. Cent. China.—*T. intónsa*, Wilson (*T. tonsura*, Veitch). Tree, to 60 ft.: young branchlets pubescent: lvs. broadly ovate, cuspidate, serrate, pubescent and grayish green beneath, 3-6 in. long; fls. 1-3: fr. ovoid, 5-angled. W. China.—*T. kiusiána*, Makino & Shiras. Tree, to 50 ft.: lvs. oblong-ovate, acute, obliquely truncate at base, serrate, glabrous, 1½-2 in. long; petiole about ¼ in. long; cyme 20-35-fld.: fr. globose. Japan. S.I.F. 2:50. Very distinct on account of the small and narrow, short-stalked lvs.—*T. orbicularis*, Jouin. Very similar to *T. petiolaris*, but lustrous and glabrous above, grayish tomentose beneath, on shorter petioles. Supposed to be a hybrid between *T. petiolaris* and *T. euchlora*, but probably only a variety of the former; originated in the nursery of Simon-Louis near Metz, Germany.—*T. paucicostata*, Maxim. Small tree; allied to *T. cordata*: lvs. ovate, usually truncate at base, with long-pointed teeth, green on both sides, about 2½ in. long. W. China.—*T. pubescens*, Ait. Tree, to 40 ft.: branchlets rusty stellate-pubescent: lvs. ovate, obliquely truncate at the base, coarsely serrate, rusty tomentulose beneath: fr. rusty tomentose. N. C. to Fla. and Texas. S.S. 1:26. Tender and rarely cult.; the plant cult. under this name is usually *T. No. 8*.—*T. rubra*, DC. (*T. caucásica*, Rupr. *T. corinthiaca*, Bosc). Tall tree with red glabrous branchlets: lvs. similar to those of *T. platyphyllos*, but glabrous, lustrous above, light green beneath, with long-pointed teeth: cymes 3-7-fld.: fr. ovoid or subglobose, slightly angled. S. E. Eu., Caucasus, W. Asia. Apparently not in cult., often confused with red-branched, slightly pubescent forms of *T. platyphyllos*.—*T. Spachii* = *T. americana* × *T. cordata*.—*T. tonsura*, Veitch = *T. intónsa*.—*T. Tian*, Szyszyl. Tree, to 50 ft.: young branchlets glabrous or nearly so: lvs. broadly ovate, truncate or slightly cordate at the base, minutely toothed, entire below the middle, grayish tomentose beneath with axillary tufts, 2½-5½ in. long; cymes 10-20-fld.: fr. subglobose, thick-shelled. Cent. China.

ALFRED REHDER.

TILLÆA (named for M. A. Tilli, 1653-1740). *Crassulacæ*. Annual herbs, usually very small, aquatic or terrestrial, somewhat succulent, generally very glabrous: lvs. opposite, cylindrical, subulate or flat, very entire: fls. minute, axillary, solitary or cymose or arranged in terminal cymose panicles, white or reddish; calyx 3-5-lobed or parted; petals 3-5, free or connate at the very base; stamens 3-5; carpels 3-5, free; follicles many, rarely 1-seeded. About 25 species, cosmopolitan. *T. muscosa*, Linn. Minute: sts. branched and decumbent at base, reddish, about 1 in. or more long: lvs. oblong, blunt: fls. axillary, sessile; sepals ovate or lanceolate; petals nearly subulate, white tipped with red. Eu., in moist barren places.

TILLAGE. The working or stirring of the land, with the purpose to improve it for agricultural purposes, is known by the general name of tillage. There is a tendency to use the word cultivation for these operations. Tillage is a specific technical term, and is to be preferred.

In the eager discussions of scientific matters, as applied to agriculture in recent years, there is danger of forgetting that the fundamental practice in all kinds of farming, after all, is the tillage of the land. The knowledge of the importance of tillage has developed late in the world's history. In fact, it was only within the latter part of the last century that the real reasons for tilling came to be popularly understood in this country. Even now there are many persons who think that the object of tillage is to kill weeds.

The modern conceptions of tillage probably date largely from Jethro Tull's book on "Horse-Hoeing Husbandry," which reached the second and full edition in 1733, in England. This book awakened so much discussion that the system of "horse-hoe husbandry" recommended by it was called the "new husbandry." There had been tillage of land before Tull's time, but his writing seems to have been the first technical effort to show that tillage is necessary to make the soil pro-

ductive rather than to kill weeds or to open the ground to receive the seeds. He contrived various tools whereby grain crops could be sown in rows and afterward tilled. The tillage of the land in early times was confined very largely to that which preceded the planting of the crop. In the vineyards of southern Europe, however, Tull observed that tillage was employed between the vines during the season of growth. Such vineyards prospered. He made experiments and observations on his return to England and came to the conclusion that tillage is of itself a very important means of making plants thrifty and productive wholly aside from its office of killing weeds. He supposed that tillage benefits plants by making the soil so fine that the minute particles can then be taken in by the roots. On the same hypothesis he explained the good effects of burning or "devonshiring" land, and also the benefits that followed the application of ashes: the minute particles of the ashes are so small as to be absorbed by roots. Although this explanation of the benefits of tillage was erroneous, nevertheless Tull showed that tillage is necessary to the best agriculture and that it is not merely a means by which seeds can be put into the land, weeds killed, and the crop taken out.

Tillage improves land in many ways. It divides and pulverizes the soil, gives the roots a wider "pasturage," as Tull puts it, increases the depth of the soil, aerates it, and improves its physical condition with respect to warmth and dryness.

Tillage also saves moisture by deepening the arable soil so that moisture is held, and also by checking evaporation from the surface by means of a thin blanket or mulch of granulated earth that is made by surface-working tools. Water is lost from the soil by under-drainage and by evaporation from the surface. The more finely the soil is granulated, within certain limits, the more water it will hold. Its capillary power is increased. As the water evaporates from the surface, the moisture is drawn up from the under surface so that there is a more or less constant flow into the atmosphere. If any foreign body, as a board or a blanket, is spread on the land, the evaporation is checked. A similar result may follow when the soil is covered with a layer of dry ashes or sand or sawdust. Very similar results are also secured when the surface is made fine and loose by means of frequent shallow tillage. The capillary connection between the surface soil and the under soil is thereby broken. This surface soil itself may be very dry, but it may serve as a blanket or mulch to the soil beneath. In some cases this conservation of moisture by frequent shallow tillage is probably the chief advantage of the tillage of the land in the growing season.

Land that is well tilled has different chemical relations from that which is neglected. Nitrification, decomposition, and other bacterial activities are hastened. The stores of plant-food are rendered available. The soil is made more productive.

The first requisite for the growing of the plant is to have the soil in such condition that the plant can thrive in it. It is only when the land is well tilled and prepared, or when its physical condition is nearly or quite perfect, that the addition of concentrated fertilizers may be expected to produce the best results. Fertilizing, therefore, is a secondary matter; tillage is primary.

The ideal tillage is that which is practised by the gardener when he grows plants in pots. The soil is ordinarily sifted or riddled so that unnecessary parts are removed, and most of it is brought into such condition that the plants can utilize it. The gardener adds leaf-mold or sand or other material, until the soil is brought into the proper physical condition. He also provides drainage in the bottom of his pots or boxes. Often the gardener will produce as much from a handful of soil as a farmer will produce from a bushel.

L. H. B.

TILLANDSIA (Elias Tillands was professor of medicine at the University of Abo, Sweden; in 1673 he made a catalogue of plants of the vicinity of Abo). *Bromeliaceae*. Mostly epiphytes and all natives of America, allied to billbergias, æchmeas, guzmanias, pineapples, and the like; ornamental glasshouse subjects.

Perennial herbs, mostly of upright growth (the common *T. usneoides* being a marked exception), the bases of the narrow entire lvs. often dilated and forming cups that hold water and in which utricularias and other water-plants sometimes grow: fls. usually borne in spikes or heads, singly beneath bracts, perfect, with 3 sepals and 3 petals which are twisted or rolled in the bud, 6 stamens, a superior ovary with filiform style: fr. a 3-valved caps. containing hairy or plumose seeds. *Vriesia* is distinguished by having 1 or 2 scales or ligules at the base of the petals on the inside, whereas the petals of *Tillandsia* are eligulate. By some authors the Spanish moss is placed separately, as *Dendropogon usneoides*, Raf., distinguished by the habit and also by characters of flower and seed. Some of the cult. tillandsias belong to still other genera. This is the case with *T. zebrina*, which is properly *Cryptanthus zonatus* (Fig. 1120, Vol. II). This is an odd plant, producing crinkled deflexed saw-edged lvs., which are whitish beneath and brown-barred above, and small clusters of white fls. See p. 902, where other kinds of *Cryptanthus* in the American trade are described. Many species are described in horticultural literature as having been intro. into cult. but most of these are known only to amateurs and in collections where species of botanical interest are chiefly grown. In the American trade about 30 names appear, many of which are to be referred to other genera. The generic limits of *Tillandsia*, as of most bromeliaceous genera, are ill defined. By different authors a given species may be placed in any one of a half-dozen genera. Lately, *Tillandsia* and *Vriesia* have been merged, but in this book *Vriesia* is kept distinct, following Mez's monograph. It is useless to attempt a

the South. The native upright tillandsias are not in the general trade, but they are sometimes offered: of such are *T. recurvata*, *T. tenuifolia*, *T. fasciculata*, *T. utriculata*.

Tillandsias are grown both for foliage and for flowers. The foliage is usually scurfy and sometimes blotched. Many of the species are very showy when in bloom, sending up strong central clusters of blue, violet, red, yellow, or white flowers. In nature, the seeds are carried in the wind by means of the soft hairs, and find lodgment on trees, where the plants grow. A few species, however, grow on the ground. In cultivation, most of the species are treated as pot-plants. The growing season is summer. In winter the plants should be kept nearly dormant, although not completely dry. They need a warm temperature and plenty of light while growing. Give a soil rich in peat. In some cases sphagnum may be added to advantage. Propagation is by suckers; also by seeds. For further cultural notes, consult *Billbergia*.

A. Plant-body slender and hanging: fls. solitary in lf.-axils.

usneoides, Linn. SPANISH, FLORIDA, or LONG MOSS. Figs. 3816, 3817. Whole plant hoary-gray, hanging from trees, the sts. very slender and often several feet long: lvs. scattered, narrow-linear, 1-3 in. long: fls. solitary in the lf.-axils, small and not showy, the petals yellow and reflexed at the end. Trop. Amer. and in the U. S. from Texas to Fla. and E. Va.; extends southward to S. Brazil. B.M. 6309. Gn. 37, p. 221. Gt. 45, p. 267. —This is one of the most characteristic plants of our southern regions. In moist regions it gives a most weird aspect to the forests. It is used as a packing material, and also, when specially prepared, for upholstery. It is rarely cult., although it is not uncommon in greenhouses, being hung on branches and beams; but it must be renewed frequently. The plant is named for its resemblance to the lichen *Usnea*.

AA. Plant-body stiff and nearly or quite erect.

B. Stamens shorter than the petals.

c. Fls. few in the cluster.

recurvata, Linn. (*T. Bártramii*, Ell., at least in part). A few inches high, tufted, with scurfy terete or filiform recurved 2-ranked lvs.: fls. 1-5 on spike that is sheathed at the base but naked above, the corolla blue and exceeding the calyx. Fla. to Argentina and Chile.

cc. Fls. many, distichous.

anceps, Lodd. (*Vriesia anceps*, Lem.). Erect, the fl.-st. 6-12 in. tall and bearing a spike with large distichous green bracts from which small blue fls. emerge: lvs. stiff, about 1 ft. long, dilated and striped at the base: fls. 2 in. or less long, blue or purplish, the perianth much exceeding the

calyx. Costa Rica, Trinidad. L.B.C. 8:771.

Lindeniana, Regel (*T. Lindenii*, Morr. *Vriesia Lindenii*, Lem.). Lvs. rosulate, about 1 ft. long, dilated at the base, long recurving: spike large, the showy distichous bracts carmine: fls. large, much exerted beyond the bracts, the large wide-spreading segms. bluish purple. Ecuador, Peru. I.H. 16:610; 27:370 (as var. *Regeliana*). G.C. II. 12:461. R.H. 1872:230; 1898:206 (as var. *tricolor*). F.M. 1872:44.—A handsome and popular species. This interesting species has also been described as *Phytarrhiza Lindenii*, Morr.

3816. The Spanish moss (*Tillandsia usneoides*) hanging from the trees. Gulf coast.

description of all the tillandsias that by chance may occur in collections. Persons who want to know the species other than those regularly in the trade should consult Baker's Handbook of the Bromeliaceae, 1889, or Mez's Bromeliaceae in DeCandolle's Monographia Phanerogamarum, 1896. The latter work, which regards *Vriesia* as a separate genus, admits 248 species of *Tillandsia*. The genus extends northward into the U. S., growing chiefly in Fla., and Texas, although one or two reach S. Ga., and the Spanish moss (which is *Tillandsia usneoides*) reaches Va. and is common throughout

BB. Stamens longer than the petals.

c. St. thickened and bulb-like at the base.

bulbosa, Hook. Small scurfy plant a few inches high, the st. swollen at the base: lvs. 3-5 in. long, much dilated and clasping at the base and terete above: fls. few, in racemose short spikes, long and narrow, the much exerted but not spreading petals purple. Var. **picta**, Hook., has the upper lvs. and bracts scarlet. W. Indies to Venezuela. B.M. 4288. F.S. 3:221.

cc. St. not prominently swollen.

D. Lvs. linear or filiform from the base or abruptly from a dilated base.

polystachya, Linn. (*T. angustifolia*, Swartz. *T. parvispica*, Baker). Lvs. rosulate, lepidote or scurfy, curved, equaling or exceeding the st.: infl. compound, somewhat paniculate, the lateral spikes shorter than the central ones, the bracts distichous and pointed and little exceeding the calyx: fls. blue. S. Fla. to Brazil.

tenuifolia, Linn. (*T. caespitosa*, Le Conte, not Cham. & Schlecht. *T. Bártramii*, Ell., in part). Plant less than 6 in. tall, reddish, clustered: lvs. awl-shaped and erect, nearly terete, concave at the base, scurfy: fls. few in a simple or somewhat compound spike, the blue petals exceeding the bracts and recurving at the apex. Ga. to Brazil.

DD. Lvs. gradually narrowed from a broad base.

fasciculata, Swartz (*T. bracteata*, Chapm. *T. glaucophylla*, Baker. *Vriesia glaucophylla*, Hook.). Tall, strong species with st. 2 ft. tall: lvs. 1-1½ ft. long, concave or channeled above, erect or ascending, scurfy and bluish: st. longer than the lvs. and branched, the branches or spikes bearing distichous keeled acute mostly greenish and red-tipped bracts: fls. narrow, exerted, blue. S. Fla., W. Indies, and Cent. Amer. B.M. 4415. F.S. 5:432.—Very variable.

utriculata, Linn. Plant 2-3 ft. high: lvs. glaucous and scurfy, becoming subulate and recurved at the summit but much dilated and imbricated at the base and forming pockets that hold water: infl. branched, the fls. far apart on the branches: fls. pale blue (pale colored forms), narrow, the petals twice longer than the sepals. S. Fla. to S. Amer. B.R. 749 (as *T. flexuosa* var. *palida*).—For full description of this species, together with plate, see Trelease, 5th Rep. Mo. Bot. Gard. (1894).

T. bivittata, Lind.=*Cryptanthus bivittatus*.—*T. Blokii*, Hort.=*Vriesia Blokii*.—*T. dianthoides*, Rossi. Scape manifest, bearing a simple infl.: fls. erect; sepals glabrous; petals violet. S. Amer. Gt. 3:138. R.H. 1905:464.—*T. Duratii*, Vis. Infl. bi- or tri-pinnately paniculate: fls. erect; petals blue. S. Amer. Gt. 50, p. 452.—*T. farinosa*, Hort.=*Billbergia pyramidalis*.—*T. ionantha*, Planch. Lvs. densely tufted, densely scaly: infl. simple, dense, and short; petals violet. Mex. B.M. 5892.—*T. La Salliana*, "A new species from S. Amer., with most brilliant fls. It is of free growth and easily cult., thriving best in a moderate temperature and in a light, fibrous soil mixed with sphagnum." (Siebrecht.)—*T. Lindenii*=*T. Lindeniana*.—*T. muscosa*=*Guzmania*.—*T. muscosa*, Hort., is probably a *Pitcairnia*. *P. muscosa*, Hook., B.M. 4770, is *Pitcairnia Beycalema*. The name *T. muscosa* has occurred in the trade, but the plant is unknown to the writer.—*T. polytrichoides*, Mass. Lvs. small, densely clothing an elongated st.: infl. 2-4-fld.: petals pale. S. Amer. R.H. 1912, p. 431.—*T. splendens*=*Vriesia*.—*T. Wilsonii*, Wats., has been intro. sparingly to cult., but does not appear to be in the trade. It was discovered in Hernando Co., Fla., in 1887 by W. P.

3817. Spanish moss.—*Tillandsia usneoides*. (Much reduced)

Wilson, of the Univ. of Penna.: "St. simple, very short (about ½ in.): lvs. numerous, 1-3 or 4 in. long, gradually narrowed from the clasping base to the long-attenuate apex, channeled above, more or less hoary, with minute appressed, petate, brown-centered scales: peduncle very slender, recurved, about equaling the lvs., with 2 distinct bracts, probably 1-3-fld.: fls. and caps. not seen." This is Sereno Watson's original description, 1888. See Min. 2, p. 180; and 6, p. 130, for pictures.—*T. ziphioides*, Ker. Lvs. densely scaly: scape very short or wanting: petals white. Argentina. G.W. 6, p. 291. B.R. 105.—*T. Zahnii*, Hort., is properly *Guzmania Zahnii*, Mez. Tufted, branching from the base, glabrous throughout: lvs. 1 ft. long, about 1 in. broad, crimson striped and yellow: infl. paniculate, subtended by scarlet bracts: fls. yellow. Costa Rica. B.M. 6059 (as *Caraguata Zahnii*). In the trade. The following names are accounted for under *Vriesia*: *carinata*, *fenestralis*, *guttata*, *hieroglyphica*, *psittacina*, *Saundersii*, *tessellata*, *zebrina* (in part).

L. H. B.

GEORGE V. NASH.†

TIMOTHY: *Phileum pratense*.

TINANTIA (named after Tinant, a Belgian botanist). *Commelinaceae*. Erect herbs, either hardy or grown in the greenhouse: lvs. medium-sized or large: peduncle terminal, rarely with 1-3 extra in the upper axils; cyme terminal, with 1-3 branches floriferous from nearly their base: fls. pedicelled; sepals distinct, green; petals distinct, obovate; stamens 6, all perfect; ovary sessile, 3-celled: caps. 3-celled, loculicidally dehiscent.—About 6 species, Trop. Amer. *T. fúgax*, Scheidw., is a tradescantia-like herb: st. glabrous, 1½ ft. high: lvs. ovate-lanceolate, pilose above, glabrous beneath: peduncle villous, 1-3-branched at apex, branches umbellate: fls. blue, with their pedicels conspicuously bracteolate at base. Known also as *Tradescantia erecta*, *T. undata*, *T. latifolia*. B.M. 1340. B.R. 1403. L.B.C. 13:1300.—Sometimes seen in old gardens but not offered in the trade.

TINNĒA (named in honor of Mlle. Tinné). *Labiatae*. Tall perennial herbs or subshrubs, pubescent or woolly, adapted to the warmhouse. Lvs. very entire: floral whorls usually laxly 2-fld., axillary or in a terminal raceme: fls. fuscous- or violet-purple, fragrant; calyx ovoid, 2-lipped; corolla-limb somewhat 2-lipped; stamens 4, didynamous; ovary shortly 4-lobed: nutlets obovoid-clavate.—About 23 species, Afr. *T. Sacleuxii*, Sprenger. Dwarf shrub with the branches shortly and densely pubescent: lvs. short-petioled, oblong or ovate, entire, ¾-1 in. long: cymes axillary, 2-5-fld.: calyx membranous, deeply 2-lipped; corolla nearly 1 in. long, lower lip much longer than upper. Trop. Afr. (?).

TIPUANA (name apparently Latinized from a Brazilian name). *Leguminosae*. Showy unarmed trees, used ornamentally in the extreme southern U. S. Lvs. unevenly pinnately compound, without stipels; fls. several, alternate; stipules minute, caducous: fls. showy, yellow or pale purplish, in loosely branched terminal panicles; calyx turbinate, teeth short and broad; standard ovate or suborbicular, not appendaged; wings obliquely obovate or oblong; keel-petals obliquely oblong, obtuse, lightly connate; stamens all connate in a sheath which is split above: pod stipitate, indehiscent, 1-3-seeded, samara-like.—About 4 species, S. Amer. Here belongs the plant recently intro. to S. Calif. as *Macharium Tipu*, which is said to yield one of the rosewoods of S. Brazil.

speciosa, Benth. (*Macharium Tipu*, Benth.). Tender yellow-fld. tree: fls. 11-21, oblong, emarginate, entire, 1½ in. long; veins somewhat parallel: standard broadly orbicular; wings very broadly half-ovate, much larger than the keel: pod veiny. S. Amer.

F. TRACY HUBBARD.†

TIPULARIA (Latin, *Tipula*, a genus of insects, alluding to the form of the flower). *Orchidaceae*. Small terrestrial orchids in N. Amer. and the Himalaya region. Herbs with solid bulbs, having several generations connected by offsets: fl. solitary; basal, appearing in autumn long after the flowering season: fls. in a long, loose, terminal raceme, green, nodding; sepals and

petals similar, spreading; labellum 3-lobed, produced into a long spur behind; column erect, wingless or narrowly winged.—Two species, one Himalayan.

discolor, Nutt. (*T. unifolia*, BSP.). CRANE-FLY ORCHIS. Scape 15–20 in. high: lf. ovate, 2–3 in. long, appearing in autumn and often surviving through the winter: raceme 5–10 in. long, loose: fls. green, tinged with purple. July, Aug. Vt. and Mich. to Fla. and La. B.B. 1:480.—Rare. HEINRICH HASSELBRING.

TITHŌNIA (of mythological derivation; Tithonus was the favorite of Aurora). *Compositæ*. Robust half-hardy annuals sometimes shrubby at base: lvs. alternate, petioled, entire or 3-lobed: heads large, on a long thickened peduncle, heterogamous; ray-fls. neuter, disk-fls. perfect and fertile; involucre hemispherical or broadly campanulate; receptacle convex; corolla yellow, ray-fls. ligulate, disk-fls. tubular, 5-toothed: achenes somewhat pilose.—About 10 species, Mex., Cent. Amer., and W. Indies.

diversifolia, Gray (*Mirasodia diversifolia*, Hemsl.). Large shrub with rather stout branches, glabrous or nearly so: lvs. petioled, membranaceous, glabrous or puberulent, ovate or almost orbicular, entire or 3–5-lobed, 9×6 in., crenate: heads orange, up to 6 in. diam., terminal or lateral, usually in 3's, on short thickened peduncles: achenes club-shaped. S. Mex. and Guatemala.

speciosa, Hook. (*Leighia speciosa*, DC. *Helianthus speciosus*, Hook.). Shrub with erect, terete st.: lvs. petioled, cordate, 3-lobed or entire, crenate: peduncle with a single head, which is scarlet and about 3 in. diam.: achenes obtusely 4-angled. Mex. B.M. 3295. G.C. III. 57, suppl. Mar. 13. F. TRACY HUBBARD.

TOCŌCA (tococo is the native name of *T. guianensis*). Including *Spharogyne*. *Melastomaceæ*. Glabrous or hispid-pilose shrubs, sometimes bearded with setæ at the axils, grown in the greenhouse for their foliage.

Leaves petioled, large, membranaceous, rarely coriaceous, entire or denticulate, 5-nerved: fls. rather large, arranged in terminal and sometimes also lateral panicles, white or rose; calyx glabrous, pilose or hispid, tube campanulate, terete or ribbed, limb obtusely rarely acutely 5–6-lobed; petals 5–6, obovate or oblong; stamens 10–12; ovary 3–5-celled: berry fleshy; seed obovoid or pyramidal.—About 50 species, natives of Brazil, N. Venezuela, and Guiana.

Tococa requires a warmhouse temperature, with shady and fairly moist place. Use leaf-mold mixed with fibrous loam, and provide ample drainage. It is best propagated from what are called split joints, or eyes with the leaf rolled up, and inserted in thumb-pots in fine sand with chopped moss; then insert pot in sand or cocoa fiber, with bottom heat of 75° to 80°. Cover with bell-glass or other inclosure to exclude air and to keep a fairly moist (but not wet) condition. In about two months the cuttings will have rooted. The wood for propagating should be well ripened. (H. A. Siebrecht.)

imperiālis, Nichols. (*Spharogyne imperiālis*, Lindl.). St. simple or little branched, erect, robust: lvs. opposite, decussate, oval, with 5 longitudinal ribs running from base to apex and many parallel transverse veins connecting them. Peru. I.H. 24:284.—Native of Peru, and intro. to Eu. by Linden in 1871. It is said to be easily grown in a warmhouse.

platyphýlla, Benth. (*Spharogyne latifolia*, Naud.). Short-stemmed plant with succulent somewhat tortuous st: lvs. broadly ovate, minutely denticulate-ciliate, 7-nerved: fls. rosy or red; ovary 5-loculed. Colombia, Venezuela, Costa Rica.—Cogniaux puts this species in a section characterized by having the lvs. destitute of vesicles and the calyx not winged. In this section it is unique by reason of its herbaceous branches with long bristles, especially at the nodes; the other

species of the section have shrubby and glabrous branches. A very beautiful plant, but considered to be difficult to grow. WILHELM MILLER.

TODDĀLIA (*Kaka Toddali*, Malabar name of *T. aculeata*). *Ruticææ*. Shrubs usually somewhat climbing or sarmentose, unarmed or prickly, adapted to the warmhouse and hardy outdoors in the extreme S. Lvs. alternate, 3-foliate; lfts. sessile, lanceolate, leathery, entire or crenate, pellucid-punctate: cymes or panicles axillary and terminal: fls. rather small, unisexual by abortion; calyx short, 2–5-toothed, -lobed, or -parted; petals 2–5, imbricate or valvate; male fls., stamens 2, 4, 5, or 8, ovary rudimentary; female fls., ovary ovoid, oblong or globose, 2–7-rarely 1-celled: fr. pea-like, hard, coriaceous, globose, permanently syncarpous.—About 20 species (including *Vepris*), natives to the Old-World tropics and the Cape. In *Toddalia* proper the petals are valvate, and the stamens as many as the petals; in the subgenus *Vepris* the petals are imbricate and the stamens twice as many as the petals.

lanceolata, Lam. (*Vepris lanceolata*, A. Juss.). Small tree or large shrub, erect, without prickles, entirely glabrous: petioles 1–2 in. long; lfts. oblong-lanceolate, 2–3 in. long, acute, entire, waved at the edge, $\frac{3}{4}$ –1 in. broad: panicles axillary and terminal, thyrsoid: petals a line long, imbricate; stamens 8, in the male fls. exserted: fr. the size of a pea, 4-lobed, fleshy, gland-dotted. Mauritius, Mozambique, Cape.—Intro. by Reasoner Bros., 1891. WILHELM MILLER.

TODĒA (H. J. Tode, a German botanist, 1733–1797). *Osmundaceæ*. GRAPE FERN. A group of ferns with fleshy sporangia, as in *Osmunda*, but having these borne on the backs of ordinary lvs. The last three species, although frequently united with *Todea*, more properly form a distinct genus *Leptopteris*, differing widely in habit from the original *Todea*; they form delicate foliage plants resembling the filmy ferns in habit. For cult., see *Ferns*.

A. *Texture leathery: lvs. bipinnate.*

bárbara, Moore (*T. africana*, Willd.). St. short, erect: lvs. in a crown, 3–4 ft. long, 9–12 in. wide; pinnae erect, spreading, sometimes 2 in. wide: sori closely placed, often covering the whole under surface at maturity. S. Afr. to New Zeal. G. 37:265.—A very resistant and useful fern. It deserves wider cult.

AA. *Texture thin: lvs. with linear divisions.*

B. *Lvs. tripinnatifid.*

hymenophylloides, Rich. & Less. (*T. pellucida*, Hook.). Lvs. 1–2 ft. long, 8–12 in. wide, lowest pinnae about as long as the others; rachises mostly naked. New Zeal.

supérba, Col. St. erect, woody: lvs. 2–4 ft. long, pinnae often crisped, the lower gradually reduced; rachises densely tomentose. New Zeal.

BB. *Lvs. bipinnate.*

Fraseri, Hook. & Grev. St. erect, woody, 18–24 in. high: lvs. 1–2 ft. long, lowest pinnae nearly as large as the others; rachis narrowly winged, naked. Austral.

L. M. UNDERWOOD.

TOFIELDIA (named after Tofield, a Yorkshire betanist). *Liliacææ*. Perennial herbs, mostly hardy: sts. erect, from a short or repent rhizome: lvs. radical or clustered at the base of the st., short-linear, somewhat distichous; cauline lvs. few or none: fls. small, in a terminal spike, subsessile or short-pedicelled; perianth persistent, segms. oblong or narrow; stamens 6; ovary sessile: caps. 3-lobed.—About 25 species, mostly north temperate and boreal regions but 1 or 2 in the Andes. *T. racemosa*, BSP. (*T. pubens*, Michx. *Triántha racemosa*, Small). Sts. slender, 1–2 ft. high, minute glandular; lvs. narrow-linear, 6–12 in. long; perianth rigid, whitish, 2 lines long. Pine barrens, N. J. to Fla. and Ala. B.M. 3859. Of no special horticultural value,

CXII. A good type of commercial tomato.—Brinton Best

TOLMIEA (named for Dr. Tolmie, surgeon of Hudson Bay Co.). *Saxifragaceæ*. Herbaceous, glandular pubescent, hardy; rhizome scaly: sts. simple: cauline lvs. alternate, radical petioled, cordate-incised-lobate; stipules membranaceous: racemes terminal, slender, simple: fls. rather secund, nodding, green; calyx-tube elongate, funnelform-campanulate, 5-lobed; petals 5, capillary; stamens 3; ovary narrowly oblong, 1-celled: caps. exserted from the calyx, superior, 2-valved, 2-beaked.—One species. Borders and wild-garden.

Ménziesii, Torr. & Gray (*Leptaxis Ménziesii*, Raf.). Perennial herb, 1-2 ft. high, with slender creeping rootstocks and some summer runners: lvs. round-cordate, more or less lobed and crenately toothed, slender-stalked, all alternate, those of the st. 2-4 in number: raceme $\frac{3}{4}$ -1½ ft. long: fls. and caps. nearly $\frac{1}{2}$ in. long, greenish or tinged purple. Forests of Mendocino Co., Calif., to Puget Sound.—Prop. naturally by adventitious buds, produced at the apex of the petioles of the radical lvs. and rooting when these fall to the ground.

WILHELM MILLER.

TÓLPIS (name unexplained). *Compósitæ*. Herbs, annual and perennial, allied to *Crepis*, with showy yellow heads, suitable for the flower-garden or border, but apparently not offered in this country; species about 15, in the Medit. region, and the Canaries and Azores. St. rarely somewhat woody: lvs. mostly radical or on lower part of st., entire, dentate or pinnatifid, the upper ones few and narrow: heads homogamous, ligulate, the involucre campanulate with narrow bracts in several series; receptacle naked or pitted: achene subterete, 6-8-ribbed, the pappus of 8-10 very slender setæ. *T. barbata*, Gaertn. (*Crèpis barbata*, Linn.), from S. Eu., is an erect branched annual with attractive yellow heads, the outer scales of involucre subulate: lvs. lanceolate, dentate, the upper ones near the fl. heads long-subulate: blooms from midsummer till frost. B.M. 35.

TOLUÍFERA: *Myroxylon*. The following species now planted as a shade tree in S. Fla. was mentioned under *Myroxylon*. **M. Pereira**, Klotzsch (*Tolúifera Pereira*, Baill.). Tree: lvs. uneven-pinnate; lfts. 6-9, from 2-3 in. long, 14-16 lines broad, oblong, glabrous; petiole $4\frac{1}{2}$ in. long, terete and sparsely puberulent: pod $2\frac{1}{2}$ -3 in. long. Cent. Amer.

TOMATO. The plant *Lycopersicum esculentum* (which see, page 1931, Vol. IV), grown extensively for its edible fruit.

The tomato is probably grown more extensively in North America than elsewhere, and the varieties have reached a high degree of perfection. The American standard or ideal is a tomato that is nearly globular, solid and "smooth" (that is, not wrinkled). (Fig. 3818.) The flat angled and wrinkled tomatoes (Fig. 3819) are now little grown in this country. These forms are little adapted to canning, in which use enormous quantities of tomatoes are employed, and they do not satisfy the popular desire. The old-time pear, cherry, and plum forms (Fig. 3820) are still grown for curiosity and also for the making of pickles and preserves, but their field culture is relatively not important. The currant tomato, grown for ornament and curiosity, is considered to be *Lycopersicum pimpinellifolium*. It sometimes hybridizes with the common species (Figs. 2234, 2235, Vol. IV).

The tomato requires a warm soil and climate, a sunny open position, and also a long season. The plants are usually started in hotbeds or glass houses, being transferred to the open as soon as settled weather comes. They are usually set from 4 to 5 feet apart each way and are allowed to grow as they will, finally covering the ground. For home use, however, the plants are often trained, in order to forward their ripening and to secure larger and better-colored fruits. The best

method is to train to a single stem, supported by a stake or perpendicular wire or cord (Fig. 3821); or sometimes it is tied to the horizontal strands of a trellis. This single-stem training requires close attention, and if the time cannot be spared for it, the vines may be allowed to lie on an inclined trellis or rack. This rack training keeps the plants from the ground and thereby allows the individual fruits to develop perfectly and also checks the spread of the fruit-rot; but it usually does not give such perfect fruits as the single-stem training, since the number of fruits is limited in the latter. Sometimes a serious difficulty in tomato-growing is a rot of the fruit. This seems to cause most damage following close wet weather when the fruit is ripening. It is thought to be worst on plants that cover the ground thickly with foliage and do not allow it to become dry on the surface. Usually it does not seriously lessen the crop beyond a few pickings; and if the plants are brought into bearing early and are kept in thrifty condition for subsequent bearing, the percentage of total injury is greatly reduced. The tomato is tender to frost. The green fruit remaining when frost kills the plants may be ripened in tight drawers or cupboards, if it is nearly or quite full grown. The tomato is a short-lived perennial, but in cold climates it is grown from seeds as an annual. It may be grown from cuttings.

L. H. B.

General culture of the tomato.

The tomato plant comes from regions in South America where the conditions of temperature and moisture in its growing season are very constantly favorable for its rapid growth and the ripening of a large yield of fruit. Although it cannot be classed as a tropical and hardly as a semi-tropical plant, it thrives best in a day temperature of 65° to 85° F., makes very slow growth in one below 40° F., and, unless hardened by gradual exposure, will be killed by a short exposure to a temperature of 32°. It is a rapid-growing short-lived plant and under favorable conditions will mature its first fruit in ninety to one hundred and twenty days from the sowing of the seed and continue in bearing for fifty to ninety days, when it will generally die of exhaustion, though its life may be prolonged (but with lessened vigor) either by cuttings or layering. It is emphatically a sun-loving plant and unobstructed sunlight is essential for its most vigorous growth and greatest fruitfulness. An attempt to grow tomatoes of superior or even good quality in an orchard or at a season when the sunlight is likely to be dimmed much of the time by clouds or mists is very likely to be disappointing.

The splendid color often seen in Italian-grown fruits is due to cloudless skies rather than to superior varieties or cultural methods. Under favorable conditions the plant is a vigorous and rapid grower and capable of maturing an enormous crop of fruit, but it requires for even a fair yield very constantly favorable conditions, and any check in its growth from cold or cloudy weather or too deep and harsh cultivation, even if the plant seems fully to recover, will surely materially lessen the yield of fruit. Many cases have been seen in which cultures within a few miles of each other and on similar soil have matured crops differing greatly in quantity and quality as a result of such difference in cultural practice as to bring one crop into the fruiting-stage in better condition, or at a time when the weather was more favorable for a full setting of fruit. The plant, however, is very tenacious of life and will often live and produce some fruit under most unfavorable conditions and many who have grown it for years do not know of the amount of fruit a healthy tomato plant is capable of producing. It is doubtful whether the average yield of all the cultures in the United States exceeds 6,000 pounds of marketable fruit to the acre. Yet every

season for the past fifty years many fields have been known where the salable crop was from 30,000 to 40,000 pounds to the acre, with exceptional still larger yields.

Exposure is often an important factor in determining the profit of a crop. Generally a gentle inclination to the southward, with protection of higher land or forest on the side from which cold and damp winds may be expected will give the largest yield of the most marketable fruit, but a sharp inclination to the south, particularly if it be steep or such as to form a hot pocket, rarely produces a maximum crop, although, because of the early ripening of the fruit, it may be a profitable one.

The largest yields recorded were generally grown on red clay loam. Large yields are often secured from soils of very different compositions, from "gumbo" prairie, marsh muck, stiff clay, to a light sand provided the conditions of drainage, fertility, and tilth are favorable, but a maximum crop can never and even a profitable one very seldom be grown on a cold soil, or one which is poorly drained, sodden, sour, or hard and solid from want of cultivation. A good crop of tomatoes very seldom follows one of tomatoes or potatoes.

Tomatoes are rank feeders and the use of fresh stable manures and those carrying a large proportion of nitrogen is likely to result in a rank growth of vines ripening a small crop of fruit of poor quality. The best yields and quality of fruit will usually be from fields rich from fertilizing in previous years. On unfertile fields where one is obliged to use commercial fertilizers, those comparatively rich in potash will generally prove most profitable. The largest yield and best fruit have generally been from rich clover sods, which were plowed as early as practicable in the spring, rolled, and made friable by repeated surface cultivation.

Although in all but the extreme northern part of the United States, in very high altitudes and in some parts of the Puget Sound country, tomatoes will generally ripen a full crop from seed sown in the open ground, from Washington northward plants so grown will rarely ripen their crop until past midsummer and much of it will miss the long days of sunshine, which are essential for the development of the best quality. On this account it is desirable, in most cases, to start the plants under glass, so as to give them fifty to sixty days' growth by the time they can be set in the open ground without danger from killing frosts. It is very easy to grow plants to this age, but the character of the growth and the condition in which they go into the fields are most important factors in determining the quantity and quality of the fruit.

Starting the plants under glass is usually accomplished best by sowing the seed in boxes about 4 inches deep and of convenient size for handling, filled with soil made up of two-fifths potting earth or garden loam, two-fifths old well-rotted cow-manure, and one-fifth

coarse sharp-grained sand. Soils used in plant-boxes or -beds should always be sterilized by spreading over steam-pipes perforated on the lower side and filled with live steam until a potato buried about 3 inches in the soil is cooked soft. The seed can be sown rather thickly and covered $\frac{1}{4}$ to $\frac{1}{2}$ inch deep. The boxes should be well watered and set in the shade until the plantlets show above the soil, when they should be set in full sunlight and kept at a constant temperature between 65° and 80°, and given water as needed. The plants should develop large seed-leaves and bud within ten to fifteen days, when they should be transplanted into the frames. The soil of the frames should be 3 to 6 inches deep and freshly made up and sterilized about as recommended for the plant-boxes. The plants may be set twelve to twenty-four to the square foot, according to the time they are expected to remain before setting in the field. The beds should be closely watched and the sash opened as the air in them becomes warmed by the sun to a temperature above 60° and as promptly

closed as it cools below 40°. The soil should be watered as necessary to prevent the plants wilting, but this should be done as far as practicable in evening or early morning, rather than during bright sunshine. If necessary the beds may be protected from frost by covering the sash with sacks, old carpets, straw, or even a sprinkling of earth. An inexperienced person will be surprised to see how effective even a slight covering often is. In case frost does creep in, it is best to keep the beds covered until they can warm up without direct sunshine, even if this takes a day or two. Cases have been known in which plants that seemed to be killed were saved by slow warming up. For a few

3818. A contemporaneous American tomato.

days before the plants are to be set in field, they should be hardened off by scant watering and fuller exposure both to the sun and night air, and the day before they are to be set should be thoroughly sprayed with bordeaux mixture. The field, particularly if it has been a clover sod, should be prepared and cutworms killed by keeping it absolutely free of green vegetation for at least a week before the plants are to be set and the evening before scattering over the surface poisoned bait made by thoroughly mixing one pound of paris green or similar poison with fifty pounds of bran or middlings moistened with sweetened water. The evening after the plants are set, the poison should also be scattered along the rows and the next day the plants should be again sprayed with bordeaux.

Field culture should begin the day after the plants are set and be repeated every four or five days and as soon after every rain as it can be done without puddling the soil. At first the culture should be as close to the plants and as deep as possible, but it should be farther from the plants and shallower each time until it is a mere stirring of the surface in the center of the row, always taking care to disturb the vines as little as possible. The plants should frequently be looked over

carefully for potato bugs, the most effective way of combating them being by hand-picking the beetles and eggs when they first appear.

When quantity and quality of fruit is second to early ripening, the seed may be sown earlier and the growth of the plants checked by crowding and a scarcity of water; so treated they generally will form a crown cluster of well-developed fruit by the time one dares risk them in the open. They are then set close in the row and rather deep, with the stem and root slanting to the south and will ripen the first cluster very early, although the remainder of the crop will be late and poor.

3819. The old-time angled form of tomato.

When quality rather than quantity of fruit is of first importance, staking and pruning is sometimes advantageous, particularly if the season or the soil is inclined to be wet. With many growers stakes 2 inches square and 5 to 6 feet long have given the best satisfaction. As soon as the tomato plant forms its first cluster of bloom it divides, and both branches are allowed to grow and then tied to the stakes while all other branches are cut off just beyond the first cluster of blossoms; during the early part of the season this will require daily attention. Staking has been found profitable and is very generally practised in the southern states.

Even when first discovered by Europeans, the plant or plants now commonly called tomatoes existed in many forms differing so materially in habit of plant and character of foliage and fruit that they were classed by botanists as distinct species, and the number of varieties offered has increased with frequent changes until American seedsmen have catalogued tomatoes under at least 513 distinct names, while many other more or less distinct forms are commonly grown abroad, particularly in Italy.

The following are some of the names used in seedsmen's catalogues, many of them standing for distinct forms of vine or fruit, while others are simply variations in stocks.

Currant or Grape.—Rank-growing, but slender small-leaved vine, very productive of long currant-like stems of bright red fruits not over $\frac{1}{4}$ inch in diameter, of little culinary value.

Cherry, both Red and Yellow.—Strong-growing vine, very productive of cherry-shaped fruits, which are excellent for pickles and preserving.

Pear, both Red and Yellow.—Strong-growing vine, small, long-necked, pear-shaped, two-celled fruits.

Plum, both Red and Yellow.—Long oval-shaped, 2-celled fruits, which are excellent for preserving.

Turk's Turban.—Long oval, bright red fruit, with a peculiar growth on the blossom end.

Potato or Broad-leaved (in a number of variations).—Comparatively small vine, with broad entire leaves.

Dwarf Champion.—Vine very short, compact, leaves thick, crumpled, nearly entire.

Tree.—Vine very short, compact and upright in growth, with distinct thick nearly entire leaves.

Peach, both Red and Yellow.—Fruits covered with down similar to that on a peach or plum.

Diadem.—Fruit bright red, distinctly striped with yellow.

White Apple.—Round smooth yellowish white fruit of delicate flavor and the best of all varieties for eating from the hand.

Golden Queen.—Fruit bright yellow, often with a distinct red blush.

Each of the above is so distinct in habit of plant foliage or fruit that botanists might perhaps classify them as distinct species, while the following are some of the more distinct of the varietal forms listed by seedsmen under different names.

Earliana.—Comparatively small weak-growing vine, but maturing very early a large crop of smooth bright red fruit.

Bonny Best.—Vigorous vine, ripening very early and evenly a large crop of uniformly round bright red fruit.

Matchless.—Large smooth bright red fruit, with red fine-flavored but not very solid flesh.

Red Rock.—A healthy productive vine, with uniformly flattened globular fruit of fine flavor.

Dwarf Giant.—Vine dwarf, but very hardy and productive of large handsome bright red fruit of superior quality.

Sterling Castle.—Vine does particularly well under glass, producing large crop of small uniformly round bright red fruit.

Prince Bourghese.—An Italian sort, wonderfully productive of bright red, long plum-shaped fruit of fine flavor.

Stone.—Very vigorous and productive vine, with oval purplish red fruit.

Ponderosa.—Very large solid-fleshed fruit with small seed cavities, little pulp, and few seeds.

June Pink.—Early-maturing, purplish pink fruit.

Acme.—Large vigorous vines, with round purple-pink fruit.

Beauty.—Strong-growing vine, with a large flattish oval purple fruit.

Honor Bright.—Vine, although apparently unhealthy, is very productive of very firm hard-fleshed fruit, which in ripening changes from white to distinct yellow, then to very bright red.

Many carefully conducted trials have shown that first germination crosses will generally give a larger yield of fruit than either parent. In the experience of breeders, such increased yields have been in proportion to the varietal distinctness and purity of stocks crossed.

No distinct difference in the varietal character of plants from seed of different fruits of an isolated vine of pure stock has been noticed, plants from seed of the first and the last ripe fruit of the same vine showing no difference in earliness. Nor has any consistent difference been detected in size or form of fruit in plants grown from seed of a small smooth and a large rough fruit from the same plant.

Although the flowers are seldom self-fertilized, it is thought that they are with few exceptions pollinated from those of the same plant, generally from those of the same cluster and one should be guided in seed selection by the general character of the plant, rather than by that of single fruit. When plants are grown so that the branches intermingle, there would very likely be crossing and it is wisest to save seed from isolated plants.

One should first form a clear-cut conception of the exact varietal character desired, then carefully select isolated plants which come nearest to ideal and save, separately, seed from a number of fruits. A few seeds from each lot should be grown to fruit maturity under glass during the winter. It is quite possible that this will reveal some lots which do not breed true; such can be rejected and the best and purest lots planted for seed crop.

Seed is often viable when taken from fruit so green that it shows but little color and plants from such seed sometimes show a little gain in earliness, but they are weaker, less fruitful and do not carry their individuality so well as those from fully ripened seed. Plumper, heavier seed, which will retain its viability much longer, is secured from fruit which is fully ripe. The amount to a bushel of fruit varies greatly from only one to two ounces in sorts like the *Ponderosa* to as high as twelve to fourteen ounces in the smaller more seedy sorts.

When the amount of fruit is less than a bushel and the appearance of the seed is important, the best plan is to spread the fruit in the sun until it is fully ripe. Cut each fruit through the center, and by squeezing the pulp and seed can be pressed out. Let this stand, and in one to three days, depending on the ripeness of the fruit and the temperature, it will separate, the seed falling to the bottom. Pour off the liquid, add to the seed two or three times its bulk of water, stir, let settle and pour off the water and repeat with fresh water until seed is clean. Spread not over three or

3820. Two forms of the pear tomato.

four seeds deep and stir every hour or two until seed is thoroughly dry.

Larger quantities can be handled as follows: Separate the pulp and seed from the flesh and skins. Seed-growers usually do this by running the ripe fruit through rollers about $\frac{1}{2}$ inch apart. (In a small way, a hand cider-mill will do this very well.) Then run the pulp and seed through a slowly revolving cylinder of wire netting of about $\frac{1}{4}$ -inch mesh, set at a slight incline so that the seed will fall through the netting, while the flesh, skins, and the like will gradually work out of the lower end. Allow the seed and pulp to stand and ferment until the seed settles and is covered with liquid, which will require from ten to forty-eight hours, according to condition. Care should be taken not to add water or rain while ground fruit is fermenting. Pour off the liquid. Put two or three pails of seed in a barrel, add four to eight pails of water, agitate, and then let seed settle and carefully pour off the water, carrying what pulp and bits of skin it will. Repeat with fresh water till seed is clean. Spread seed not over $\frac{1}{4}$ inch deep on cloth- or wire-bottom screens. Expose to sun and every few hours stir the seed until it is entirely dry, then bag. Care should be taken to be sure that seed is quite dry before bagging, for it will seem dry to a novice long before it is fit.

W. W. TRACY.

Growing of tomatoes in the South.

The growing of tomatoes on a commercial scale in the southern states began just prior to 1900 and has gradually increased until it is now one of the most important crops grown in that section. Especially is this true of Florida, Mississippi, and Texas.

The crop in Florida begins to move in December and continues at intervals during the winter months. The movement in Mississippi and Texas is more concentrated, beginning the latter part of May and closing the last of June. During the height of the tomato season, solid trainloads of tomatoes are shipped out of the two last-named states daily.

In growing the tomato for the northern markets, earliness is of prime importance. For this purpose, it is necessary to start the crop during the winter

months, and, as the tomato is very sensitive to cold, it must be given careful protection for the first six weeks or two months of its growth. This necessarily means extra care and expense, which, in turn, means that the grower, in order to succeed, must exercise a higher degree of intelligence than is shown in the production of the average vegetable crop.

It has been clearly demonstrated that it does not pay to grow tomatoes on a large scale, nor does it pay to grow them when most of the help has to be hired. The best results are obtained when a single family plants not over two or three acres and does all the detail work connected with the growing and harvesting of the crop.

Tomatoes for the early market are started in hot-

beds. Both manure and flue hotbeds are used for this purpose. The soil of the hotbed should be loose and porous, but not too rich. Especially should an excessive amount of organic matter be avoided. A good average soil, with 1 inch of leaf-mold added gives good results.

The seeds are sown about January 20. They are placed in rows 4 inches apart, $\frac{1}{2}$ inch deep, and from three to four seeds to the inch. Under normal conditions, the seed should begin germinating in six to eight days. The temperature should not be allowed to go over 80° F., during the day, nor below 65° at night. The heat should be so regulated as to produce a slow, steady growth. Too much heat produces rapid, succulent growth, often causing the plants to become weak and spindling, under which conditions they are easily affected by adverse weather and more subject to the attacks of diseases.

As soon as the young plants begin to grow, plenty of ventilation should be given and the soil frequently stirred. The soil should be kept moist, but not wet. By the last week in February, the plants begin to crowd in the row, at which time they should be moved to the cold-frame.

The coldframe is usually located in the field where the crop is to be grown. The soil in the coldframe should be richer and should contain more organic matter than that in the hotbed. The rows are laid off about 3 to 4 inches apart, and the plants set 4 inches apart in the row. A board with wooden pegs set 4

inches apart may be used to advantage in opening the holes for the plants. It is advisable to set the plants deeper than they stood in the hotbed, and, as soon as transplanted, they should be given a good watering. Special pains should be taken to protect them from sudden changes in temperature. At first they should be carefully covered at night; and if the weather is very threatening, an extra cover, such as cotton bagging, Sudan grass mats, and the like, should be used. Whenever the weather is clear and bright, the top should be lifted during the warm part of the day. During the latter part of March, when the nights are warm, the cover may be left off entirely, so as gradually to harden the plants. By the first of April, the tomatoes begin to crowd in the row, which is a good indication that they are ready for moving to the open field.

Tomatoes for the early market should be planted on well-drained elevated land, that has some form of windbreak on the north side. The land should be well broken with a turning plow, then disked, harrowed, and laid off in 4-foot rows. A furrow should be run down each row and fertilizer applied and mixed in with the soil. Just before taking the plants from the coldframe, the soil should be given a thorough wetting. Then one end of the coldframe should be knocked out and the soil should be removed to a depth of 2 inches, up to within a few inches of the first row of plants. A sharp spade or mason's trowel is then used and a 4-inch square is cut around each plant, after which the block of soil containing the tomato is carefully lifted and placed in a flat box or on a wide board, which is then

3822. A strand of winter tomato, the clusters supported by slings.

3821. Stake-trained tomato.

set in a wagon. The wagon should be made to straddle one row and the plants lifted out from the rear and placed from 2 to 3 feet apart in the three adjoining rows. Special pains should be taken when the plants are placed in the furrow to prevent the soil from breaking away from the roots, as they will wilt easily at this stage. Moist soil should be drawn by hand and pressed around each plant. A sweep or small turning plow should then be run around each row so as to fill in the remainder of the furrow.

Tomatoes should receive frequent and thorough cultivation from the time they are set in the open field until the first fruits begin to ripen. A crust should never be allowed to form on the soil, nor should weeds be allowed to grow. A five-tooth cultivator is one of the best implements that can be used in cultivation.

When moved to the open field, the plants are often beginning to show their first cluster of blooms and are also beginning to force out shoots from the axils of the leaves. The plants should be gone over carefully every few days and all lateral shoots and suckers should be removed before they have grown longer than 1 inch. It is a serious mistake to neglect removing shoots and suckers, even for a few days.

When three or four fruit-clusters have set, the terminal bud is pinched out, and thereafter no new growth whatever should be allowed. This severe pruning undoubtedly reduces the amount of fruit to the acre, but it is a considerable aid in the development of quality and earliness.

The staking, like the pruning, should begin soon after the plants are set in the field. A 4-foot stake, 1 by 2 inches, should be driven down within a few inches of the plant, and coarse twine wrapped around the plant and tied to the stake. Two or three tyings should be made during the development of the plant. The staking holds the vines and fruit off the ground, prevents rotting of the fruit in wet weather, and allows the sun and air to strike the fruit, thus inducing earliness, while, at the same time, reducing the danger from diseases.

Tomatoes in the southern states north of Florida begin to ripen about the middle of May. As soon as the ripening period arrives, the tomato patch should be gone over every day during the shipping-season. As soon as the fruit shows a deep creamy white color, with a faint blush of pink, it is ready for harvesting. At the first of the season, the fruit may be allowed to take on a deeper color than later on.

Tomatoes are gathered in one-half-bushel baskets, lined with coarse ducking, and carried to the packing-sheds, which are generally located in the field, and then packed in four-basket crates, averaging twenty pounds, or one-third bushel, each. As a rule, there are two grades: fancy and choice. The fancy are packed with the stem end down and average about twelve to the basket. The choice are packed on the side and average about fifteen to the basket. The six-basket crate is now becoming popular in some sections.

The bulk of the crop is shipped in refrigerator cars, well iced. It is now becoming the custom, when distant markets are to be reached, to harvest the fruit as soon as it is mature, but while still quite green in color. Each tomato is wrapped with soft paper and packed in flats or six-basket carriers and shipped in refrigerator cars, with the ventilators open, but without ice. This is known as the "green-wrapped" pack. It requires 896 four-basket crates to fill a car. A fair average yield is 250 crates to the acre, although a few growers sometimes produce as high as 600. A good average price for a season is 60 cents a crate.

A medium to large tomato, one that is smooth and does not crack easily, is the best for early shipping. The Acme has been the leading variety for many years, while the Earliana, Stone, and Beauty, are grown on a small scale in some sections.

There is no standard fertilizer for tomatoes. Tomato soils of Texas are relatively rich in potash; so, as a rule, it is not necessary to use more than 1 per cent of this ingredient. Most of the Texas growers use a fertilizer containing from 8 to 10 per cent of phosphoric acid, 2 per cent of nitrogen, and 1 per cent of potash. A fertilizer containing from 400 to 600 pounds of equal parts of acid phosphate and cottonseed meal to the acre gives very satisfactory results. In the states east of the Mississippi River, the amount of potash is considerably increased; the total amount of fertilizer used to the acre is also considerably greater. From 800 to 1,000 pounds of fertilizer to the acre, containing 6 per cent phosphoric acid, 7 per cent potash, and 3 per cent of nitrogen, seems to be satisfactory. Fifteen or twenty loads of manure to the acre, applied broadcast, two or

3823. A prolific tomato, the result of training to a single stem.

three months in advance of planting the crop, will always give good results.

The damping-off fungi often attacks the young plants while they are in the hotbed. These fungi work on the stem of the plant, just where it enters the soil, causing it to shrivel and the top to fall over. Wet soil and a damp sultry atmosphere are conditions that favor the development of this disease. Frequent stirring of the soil and thorough ventilation will go a long way toward preventing the appearance of this trouble. A thin coating of tobacco dust or a mixture of three parts of lime to one of sulfur, spread over the soil after the seed is planted, will also help to hold the disease in check.

The blossom-end rot is a very destructive disease. It makes its appearance when the fruit first begins to ripen, thereby destroying the earliest and most profita-

ble part of the crop. The fruit is attacked at the blossom-end. A small black speck first appears, which gradually increases in size until the entire fruit is affected. There is practically no remedy. The best thing to do is to gather and destroy the fruit as soon as it becomes affected.

Tomato-wilt often attacks the plants when the crop is grown on the same land more than one season in succession. Rotation should be practised as a safeguard against this disease.

The nematode is a microscopic worm which attacks the roots of a tomato plant and causes small bead-like knots to form. Ground infested with this pest should be avoided and whenever there is danger of infestation, cowpeas should not be planted on the land preceding tomatoes, as most varieties of peas encourage the development of the nematode.

The boll-worm sometimes causes considerable damage. This is a large green worm that enters the fruit near the stem-end. As soon as the fruit becomes infested, it is entirely worthless and should be removed and fed to hogs or destroyed. The boll-worm can be partially controlled by spraying with arsenate of lead; but, as it seldom makes its appearance before the fruit is full grown, there is danger in using any poison as a sprav

E. J. KYLE.

Tomato-growing under glass.

The tomato ranks next to the cucumber and perhaps next to lettuce in importance as a vegetable forcing crop. It is grown extensively under glass near all of the large cities of the North from the Mississippi River to the Atlantic coast. In some instances houses are devoted wholly to tomatoes, while in the larger number of cases other crops are grown in rotation with tomatoes. A very common practice is to produce lettuce until early spring and then the beds and benches are planted in tomatoes which will ripen during the months of May, June, and July. An early summer crop is considered more profitable than late fall and winter tomatoes, notwithstanding the fact that prices are always much lower. The larger net profits are due to larger yields obtained at much less expense, and there are no fuel bills to pay during the months of June and July and very little artificial heat is required in April and May. These remarks are not intended even to suggest that the forcing of tomatoes should be restricted to late spring and early summer, for many growers realize satisfactory profits on the fall crop and sometimes on midwinter tomatoes.

The tomato is also a popular vegetable in houses which are used solely in providing fresh vegetables at all seasons for the home table. No fruit or vegetable is more appreciated in the winter months than well-grown greenhouse tomatoes which are superior in quality to those grown in the open ground.

Numerous varieties are used for forcing purposes. English varieties have received much attention and some of them, such as Comet, have been grown on a large scale. American sorts, however, are now relied on mainly by the most extensive American growers. Bonny Best is undoubtedly taking the lead among red-fruited varieties. It is very prolific and the round smooth fruits are popular on most markets. Beauty, Globe, and Trucker Favorite are planted most extensively wherever pink or purple fruits are wanted.

In the starting of tomato plants for forcing, there should be uninterrupted growth from germination until the plants have attained full size in the beds. It is customary to sow the seed for the fall crop soon after June 20, and for the spring crop from January 15 to February 1. If a very early spring crop is wanted, the seed should be sown January 1 or even earlier. The seedlings may be planted in beds or flats at the first transplanting and the second shift should be made to

pots large enough to care for the plants without crowding. A third shift to 4- to 6-inch pots is often made, and with good management this should result in very fine plants.

Most of the large commercial growers employ solid beds. Raised benches are used in some sections, especially when carnations precede the tomatoes. Solid beds require no expense for construction and maintenance and it is less difficult to maintain uniform soil-moisture conditions. Benches are an advantage when bottom heat is desired and this should be considered if the crop is to be grown at midwinter. If lettuce is grown until the tomatoes are planted early in the spring, solid beds will be found entirely satisfactory. Large pots and boxes are often used in small houses but they are not practicable on a large commercial scale.

Some persons have an idea that the tomato does well in poor soils. This is an erroneous impression, for high yields are obtained only in rich soils. It is true that the proportion of plant-food must be well balanced. An excess of nitrogen, with copious watering and high temperature, causes a rank growth of plants and a low yield. But the soil must be well provided with the mineral elements and enough nitrogen to meet the needs of the plant. If lettuce is grown until March, and enough manure employed to obtain good crops, the soil should be in ideal condition for tomatoes. It must be borne in mind that the greenhouse soil is a kind of manufactured soil, and it is important to give special attention to the supply of fiber or organic matter. The productiveness of greenhouse soils, whatever the crop may be, depends more on their physical properties than upon their chemical composition. Stable manure, used in ample quantity for lettuce, will make the best preparation for tomatoes and no additional manure will need to be applied to the tomatoes, except as a mulch. Special fertilizers have not been found necessary, and seldom an advantage, when stable manure has been used in sufficient amount to keep the soil in proper physical condition. While sandy loams are preferable for growing tomatoes under glass, any of the common soils, clays included, will give good results when properly handled.

There is the greatest diversity of practice among growers concerning planting distances. Some prefer to plant close together in rows with liberal spacing between rows. For example, a highly successful gardener sets the plants 14 inches apart in rows 30 inches apart. Some plant 2 feet apart each way with alleys at convenient distances. In large commercial houses, liberal spacing between rows is a great advantage in training the plants, pollinating the flowers, and picking the fruit.

It is possible to do a little intercropping between the tomato plants. Lettuce and radishes are sometimes grown between the rows, by starting the crops immediately after the tomato plants have been set. The practice is only fairly satisfactory because the tomato plants shade the lettuce and radishes so that the latter crops are seldom very good.

While tomato plants may be trained to two or more stems, the almost universal practice under glass is to grow single stems. (Figs. 3822, 3823.) This is easily accomplished by removing with thumb and finger all lateral branches as fast as they appear. In order that the laterals do not make too much growth, it is best to look over the plants every three or four days. When the plants attain a height of about 5 feet the tops are nipped. The stems may be supported in any convenient way. Various arrangements of wire, or wire and strings, are usually employed. A common practice is to use fairly heavy string or twine for the uprights which are tied to wires running lengthwise in the house.

Tomatoes under glass may be tilled, if it is preferred, but the better practice is to mulch the ground

with 3 or 4 inches of fresh horse-manure which has been aerated in thin layers a few days before being applied. The mulch should be applied after most of the fruit has been set. If applied too soon, an excessive vine growth and sparse setting of fruit may result. A mulch of manure keeps the soil in a loose and friable condition; it conserves moisture more perfectly than the most thorough tillage; it furnishes plant-food every time water is applied; it prevents weed growth and saves labor in rendering tillage unnecessary.

The temperature of the house at night should not fall below 60°. From 10° to 15° higher during the day will provide excellent growing conditions. If there is bright sunshine and the ventilators are open, there need be no fear if the temperature should rise to 100°. Some fresh air should be admitted every day, but good judgment should be exercised in ventilating the houses. Excessive watering must be avoided. High temperatures, over-watering, and poor ventilation are responsible for many failures.

Some attention must be given to the pollination of the flowers. Various methods are followed. Some careful growers use a little camel's-hair brush on each flower that is likely to contain ripe pollen-grains, and the grains of pollen are thus carried from flower to flower just as bees and other insects might perform this work out-of-doors. Jarring the plants daily is usually sufficient to get a good setting of the spring and early summer crops. Whatever the method employed, the work should be done, if possible, when there is bright sunshine and the atmosphere of the house is as dry as possible.

Greenhouse tomatoes have certain enemies which must be controlled if a satisfactory crop of fruit is desired. Steam sterilization of the soil previous to setting the plants is practicable in most large greenhouses. This is by far the most effective means of destroying the nematodes which cause an abnormal development of the roots and interfere with the nutrition of the plants. Steam sterilization also helps to prevent some of the diseases to which the tomato is subject. Blight, mold, and the cedema are among the most serious diseases. Frequent and thorough application of bordeaux mixture is valuable in controlling various diseases. The white-fly is the most destructive insect pest. It may be controlled by fumigating with hydrocyanic gas.

Some of the most successful growers are able to obtain yields of ten pounds to the plant for the spring crop. This, however, is considerably above the average when the entire country is taken into account. Six pounds to the plant, for the spring crop, is a good yield, and four pounds for the winter crop is considered satisfactory. An average of 10 cents a pound for the spring crop makes it a profitable undertaking, and 30 cents a pound is not too much for the winter crop.

The greenhouse tomato should be of the highest quality and special care should be exercised in marketing it. Small packages holding about five pounds are preferable. The tomatoes should be clean and wrapped in paper bearing the name of the grower. The grower should be able to guarantee every specimen which is packed in the number 1 grade.

R. L. WATTS.

TOMATO, HUSK: *Physalis*. Strawberry T.: *Physalis Alkekengi* and *P. pubescens*. Tree T.: *Cyphomandra*.

TOMMASÍNIA: *Angelica*. The following species, in the lists under Tommasinia, should be entered with *Angelica* in Vol. I, p. 287. *Angelica verticillaris*, Linn. (*Tommasinia verticillaris*, Bertol. *Peucedanum verticillare*, Koch). Advertised in this country as a lawn plant. It is a hardy perennial, about 1 ft. tall, with many small yellow-green fls.: lvs. 3-pinnate, the lfts. ovate, acute-serrate and the lateral ones often 2-lobed and the terminal one 3-lobed, the petiole much dilated at base. Piedmont region, S. Eu.

TOOLS: *Machinery and Implements*, Vol. IV, page 1939.

TORÈNIA (named for Olaf Toren, clergyman; traveled in China 1750-1752 and discovered *T. asiatica*). *Scrophulariaceæ*. Glabrous, pubescent or hirsute annual or perennial herbs, mostly low, branching and somewhat decumbent, grown sometimes in the warmhouse for winter bloom, but mostly grown as garden annuals.

Leaves opposite, entire, crenate or serrate; racemes short, few-fl., terminal or false-axillary; calyx tubular, plicate or 3-5-winged, apex obliquely 3-5-toothed or 2-lipped; corolla-tube cylindrical or often broadened above, 2-lipped; stamens 4, perfect, in pairs of unequal length; caps. oblong.—About 33 species, Trop. and E. extra-Trop. Asia and Trop. Afr.

Torenia is of easy cultivation and are very useful for window-boxes, low borders, or even for large masses. The flowers are not large but the plants are floriferous and keep in good leaf and flowers from spring to frost. *T. Fournieri* has the best habit for a bedding plant, but it may be bordered with *T. flava*. They are easily raised from seed, sown indoors or in the open, but may also be grown from cuttings.

In Florida *Torenia Fournieri* is an excellent substitute for the pansy, which is cultivated only with difficulty so far south.

Young plants come up by the hundreds around the old plants from self-sown seed during the rainy season. The species can also be propagated with great ease by cuttings. The torenia shows its full beauty when planted in beds or borders or in masses in front of small evergreen shrubs. It flowers abundantly throughout the summer, and even late in fall isolated flowers may be found. The best results are obtained by treating it as an annual. Any good and rich light soil seems to meet its requirements. It succeeds almost everywhere but prefers shade and moisture. It even grows luxuriantly in wet places

along ditches and water-courses where forget-me-nots grow in the North. If such localities, however, are very shady, the flowers, though much larger, are neither produced so abundantly nor are they colored so brightly as in sunny situations. On the other hand, it is sometimes found in such dry positions, where only cacti and yuccas manage to live, that one can scarcely understand how it is able to succeed. In good soil the torenia attains a height of 8 to 10 inches, and when planted about 8 inches apart soon covers the ground entirely. There is already a great variety in colors, but the typical plant has beautiful light blue and royal purple flowers, with a bright yellow throat, in texture rivaling the most exquisite velvet. (H. Nehrling.)

A. Fls. mainly yellow.

flava, Buch.-Ham. (*T. Baillonii*, Godefr.). Usually decumbent and creeping; lvs. 1-2 in. long, ovate to oblong, coarsely crenate; petiole half as long as the blade or less; fls. axillary and solitary or scattered at the ends of the branches in pairs on an erect rachia; corolla-

3824. *Torenia asiatica*.
(× 5/8)

tube red-purple above, yellow beneath; corolla-limb bright golden yellow with a purple eye. India and E. Asia. B.M. 6700. F. 1883, p. 55.

AA. Fls. mainly blue or white.

B. Lvs. cordate-lanceolate.

Fournièri, Lind. (*T. edéntula*, Hort., not Benth.). Low, bushy, usually annual, becoming nearly 1 ft. high: st. 4-angled: lvs. petioled, cordate-lanceolate, 1-1½ in. long, crenate-serrate; petiole ½ in. long: corolla-tube narrow, yellow; corolla-limb 2-lipped, the posterior lip not cut, pale blue, the anterior 3-lobed; lobes round-obtuse, dark purplish blue, the anterior lobe marked with a yellow blotch. I.H. 23:249. R.H. 1876, p. 465. B.M. 6747. G. 1:58. Var. *álba*, Hort. (var. White Wings), has pure white fls. A.F. 5:401. G.M. 36:87. Var. *compácta*, Hort., is a more compact form than the type and rather larger-fl. G.W. 10, p. 610. Var. *grandiflora*, Hort., has somewhat larger fls. and is more free-flowering. Var. *speciosa*, Hort., is a showy form offered in the trade, probably very similar to var. *grandiflora*.

BB. Lvs. ovate or deltoid-ovate.

asiática, Linn. Fig. 3824. Annual, erect or diffuse: st. quadrangular: lvs. ovate or ovate-lanceolate, long-acuminate, serrate, obtuse, not cordate at the base, rough to the touch: peduncles axillary, single-fl.; corolla large; tube dark purple; limb 4-lobed, of a delicate pale purple-blue, with a dark blotch on 3 of the lobes, without a yellow eye; stamens 4, the 2 longer with a subulate spur. India. B.M. 4249. Var. *pulchérriima*, Hort., has larger, dark violet-blue fls. with a white spot on the upper lip. G.Z. 4:96.

atropurpurea, Ridley. Lvs. ovate or ovate-deltoid, ¾-1½ x ¼-¾ in., short-petioled, serrate: fls. usually solitary on peduncles at the ends of the branches; calyx narrow, wingless; corolla dark purple, 1½ in. long, tube narrow at the base, much exserted, enlarged and curved above, limb about 1 in. across with 4 rounded lobes. Malay Penins. B.M. 8388.

F. TRACY HUBBARD.†

TORRÉYA (named for Dr. John Torrey, one of the most distinguished of the earlier American botanists; 1796-1873). Syns., *Tumion*, *Caryotaxus*, *Taxaceæ*. Ornamental evergreens, grown for their handsome foliage and interesting habit.

Strong broad trees: lvs. 2-ranked, linear or linear-lanceolate, with 2 narrow glaucous lines beneath, becoming fulvous with age; when bruised the foliage emits a pungent or fetid odor except in *T. grandis*: fls. dioecious, rarely monœcious; staminate fls. ovoid or oblong, composed of 6-8 whorls of stamens, surrounded at the base by bud-scales; pistillate fls. consisting of a solitary ovule surrounded at the base by a fleshy aril and several scales: fr. drupe-like, consisting of a rather large seed, with thick woody shell entirely covered by a thin fleshy aril.—Four species in N. Amer. and E. Asia. The hard, strong, and close-grained wood is much valued in Japan for cabinet-making and building. It is very durable in the ground. In this country it has been used for fence-posts.

The torreyas are handsome evergreen trees, with spreading usually whorled branches, clothed with yew-like two-ranked dark green foliage; the fruits are drupe-like and about 1 inch long. They are but little known in cultivation and rarely seen in a flourishing condition. The Japanese *T. nucifera* is the hardiest and has proved fairly hardy as far north as Massachusetts; also *T. grandis* survives in very sheltered positions in the vicinity of Boston, but the other two species are much tenderer. Torreyas grow best in shaded and sheltered positions and in a somewhat moist loamy soil. Propagation is by seeds; also by cuttings and by grafting on *Cephalotaxus*. Plants raised from cuttings grow very slowly and usu-

ally remain bushy. For cions, terminal shoots should be selected.

A. Branches, 2 years old, yellowish green or yellowish brown.

B. Lvs. linear, emitting a fetid odor when bruised.

taxifolia, Arn. (*Tumion taxifolium*, Greene). Fig. 3825. Tree, attaining 40 ft., with spreading, slightly pendulous branches, forming a rather open pyramidal head: bark brown, tinged orange: lvs. linear, acuminate, dark or dark yellowish green above, with narrow white lines beneath, ¾-1½ in. long: fr. obovate, dark purple, 1-1¼ in. long. Fla. S.S. 10:512.

BB. Lvs. linear-lanceolate, without strong odor.

grándis, Fort. (*T. Fargesii*, Franch. *Tumion grándis*, Greene). Tree, occasionally to 80 ft. high, sometimes shrubby: lvs. linear-lanceolate, ½-1 in. long and ½ in. broad, bright green and lustrous above, with 2 white lines beneath: fr. ovoid or globose, ¾-1 in. long. China. R.H. 1879, p. 173. G.C. II. 22:681.

AA. Branches, 2 years old, reddish brown: lvs. emitting a pungent aromatic odor when bruised.

B. Length of lvs. 1-3½ in., shape linear.

californica, Torr. (*T. Myristica*, Hook. f. *Tumion californicum*, Greene). CALIFORNIA NUTMEG. Tree, attaining 70 or occasionally 100 ft., with spreading, slightly pendulous branches, forming a pyramidal or, in old age, round-topped head: bark grayish brown, tinged with orange: lvs. linear, slightly falcate, acuminate, lustrous and dark green above, 1-3½ in. long: fr. oblong-oval or oval, light green, streaked with purple, 1-1½ in. long. Calif. S.S. 10:513. B.M. 4780. F.S. 9:925. G.C. II. 24:553; III. 5:800, 801. R.H. 1875, pp. 76, 77; 1879, pp. 171, 172.

BB. Length of lvs. ¾-1¼ in., shape lanceolate.

nucifera, Sieb. & Zucc. Tree, usually 30 ft., but occasionally 80 ft. high, with spreading branches, forming a compact head, sometimes shrubby: bark bright red: lvs. lanceolate, acuminate, rigid and spiny pointed, very dark green above, with 2 white lines beneath, ¾-1¼ in. long and ½-¾ in. broad: fr. obovoid-oblong, green, about 1 in. long. Japan. S.Z. 2:129. R.H. 1873, p. 315. S.I.F. 1:15.

ALFRED REHDER.

TOURNEFORTIA (Jos. Pitton de Tournefort, 1656-1708; one of the earliest systematic botanists). *Boraginaceæ*. A large genus comprising possibly 100 species widely scattered about the warmer parts of the

3825. *Torreya taxifolia*. (×¾)

world. Mostly trees and shrubs, rarely subshrubs, with alternate simple lvs. and small fls. in terminal cymes. *T. heliotropioides*, Hook. = *Heliotropium anchusæfolium*, which see.

TOWNSENDIA (David Townsend, botanical associate of Wm. Darlington, of Pennsylvania). *Compositæ*. Low many-stemmed herbs, nearly all of which are natives of the Rocky Mountains; sometimes planted.

Leaves linear or spatulate, entire; heads rather large, resembling those of *Aster*; rays in 1 series, from violet to rose-purple or white and blooming from early spring to summer.—About 17 species. The annual or biennial species have larger heads than most of the perennials. Judging from the literature, the largest-fl. of the perennials are *T. condensata*, *T. Wilcoxiana*, and *T. Rothrockii*, 3 species which seem not to be in cult. as yet. The species mentioned below are presumably among the most desirable of the genus. They are offered by collectors of Colo. wild flowers. As a genus, *Townsendia* is distinguished mainly by its achene, which is commonly beset with bristly duplex hairs, having a forked or glochidiate-capitellate apex. *Townsendia* is practically unknown to floriculture. For fuller account, see Gray's Synoptical Flora of North America and Coulter and Nelson's Manual of Rocky Mountain Botany.

grandiflora, Nutt. Biennial or perennial, 9–18 in. high: sts. spreading from the base, sometimes branching also above; upper lvs. often linear: bracts of involucre conspicuously attenuate-acuminate and scarious-margined: heads large; rays $\frac{1}{2}$ in. long, bright blue or violet. Summer. Foothills W. Neb. to Colo. and New Mex.

excæpa, Porter. Nearly stemless perennial with sessile heads surrounded and surpassed by the linear lvs.: heads $\frac{3}{4}$ in. across; rays white or purplish-tinged; involucre bracts narrowly lanceolate, mostly acute; pappus-bristles very setose. April, May. Dry hills, plains, or mountains, Sask. to Rockies, south to New Mex. and Ariz.—Known as "Easter daisy" in Colo.

T. condensata, Parry. Very lanuginous: lvs. spatulate-obovate, crowded around the large, broad, sessile heads: rays 100 or more, narrow. Wyo.—*T. Rothrockii*, Gray. Lvs. spatulate, rosulate around the solitary head which is closely sessile at surface of ground, or at length with 1 or 2 additional heads from same crown. Colo.—*T. Wilcoxiana*, Wood. A small stemless plant: lvs. in rosettes, spatulate, hairy: fl.-heads yellow, on short scapes, $\frac{1}{2}$ in. across. Dry plains and hills, Okla. to Colo.

WILHELM MILLER.

TOXICODÉNDRON (Greek, *poison tree*): *Hyænanche*, but by some retained as the tenable name. This *Toxicodendron* dates from 1796, but the *Toxicodendron* of Tournefort and Miller is much earlier and is revived by some botanists for the poison sumac and poison ivy (*T. Vernix* and *T. radicans*) and their kin but which in this book are still retained in *Rhus*. *T. capense*, Thunb., a very different plant and one of the *Euphorbiacæ*, is treated under *Hyænanche*, Vol. III, page 1618.

TOXICOPHLEÆA: *Acocanthera*.

TÓXYLON: *Maclura*.

TRACHÉLIUM (Greek, *trachelos*, neck: from its supposed efficacy in diseases of the throat). *Campanulacæ*. THROATWORT. Perennial herbs or subshrubs, glabrous or hispid, hardy but not much grown: sts. sometimes tall and rather simple, with the fls. numerous, in a much-branched corymbose panicle, sometimes short, many-stemmed or cespitosely much branched, with the fls. rather umbellate at the ends of the branches: fls. blue; calyx-tube adnate, obovoid or subglobose, angulate; limb 5-parted, lobes narrow; corolla narrowly tubular, top shortly 5-lobed; ovary inferior, 3- rarely 2-celled, many-ovuled: caps. subglobose, angulate, membranaceous; seeds small.—About 6 or 7 species, Medit. region. Prop. by seeds or cuttings.

cærûleum, Linn. A half-hardy biennial or perennial, 1–3 ft. high: lvs. ovate, acuminate, unequally serrate: fls. blue or white, in dense terminal cymes, in late summer. Shaded places in S. Eu. B.R. 72. Gn. 28, p. 181; 47, p. 303; 51, p. 84. J.H. III. 50:17.—An attractive late-flowering perennial suited to cult. as an annual. According to Gn. 28, p. 181, the species is fairly hardy in

3826. *Trachelospermum jasminoides*. (× $\frac{3}{4}$)

England, but young plants are more floriferous than old ones. Seed may be sown in March. The plant is easily prop. by cuttings. According to Gn. 47, p. 303, plants from cuttings are dwarfer than seedlings.

F. W. BARCLAY.

TRACHELOSPÉRMUM (Greek, *neck* and *seed*, referring to the fact that the seed has a neck). Syn., *Rhynchospermum*. *Apocynacæ*. Glabrous or slightly tomentose-puberulent shrubs, the typical species tall-climbing, grown in the warmhouse and a favorite out-of-doors in the South.

Leaves opposite, distantly feather-veined: cymes lax, terminal or pseudo-axillary: fls. white; calyx small, 5-parted, with 5–10 scales or glands inside at the base; corolla salver-shaped, tube cylindrical, 5-lobed, lobes oblong, twisted to the left, overlapping to the right; disk annulate, truncate or 5-lobed; ovary 2-carpelled: follicles elongate, slender, terete.—About 16 species, E. Asia and Malaya.

Trachelospermum is a most satisfactory greenhouse shrub for a general collection. It requires no special treatment, except that the plants should be kept on the dry side during the winter. It requires several years to work up a good-sized specimen. Young plants should be given warmhouse treatment and encouraged to grow. Large well-established specimens thrive in a coolhouse. In summer the pots may be plunged outdoors in a partially shaded position. The species is propagated by cuttings of half-ripened wood taken with a heel in spring. The star jasmine is one of the many good old standard greenhouse plants that are too little seen nowadays. The specimens require considerable room, and the gardener is sometimes compelled to keep them in a cold pit until the chrysanthemum season is over, although this treatment is not to be advised. It is a tender evergreen shrubby climber from China, with fragrant white five-lobed flowers. It is a favorite in the South, where it is grown out-of-doors and known as the "confederate jessamine." In northern conservatories it is generally known under its synonym, *Rhynchospermum*. Handsome specimens may be grown in large tubs, making dense bushes 3 to 4 feet high and as much in diameter. (Robert Shore.)

jasminoides, Lem. (*Rhynchospermum jasminoides*, Lindl.). STAR JASMINE. Also called "Confederate," "Malayan" or "African" Jessamine. Fig. 3826. Tender, evergreen, climbing shrub: lvs. short-stalked, ovate-lanceolate, acute, glabrous: peduncles much longer than lvs.: calyx-lobes reflexed; corolla-tube contracted

below the middle; several jagged scales at base of corolla; 5 large glands at base of ovary, 2 united, 3 free. S. China. B.M. 4737. Gng. 5:132. Gn. 41, p. 507. J.F. 1:61. R.H. 1902, p. 367. G. 37:191. Var. *variegatum*, Hort., has lvs. of green and white, tinged red.

T. diaricatum, Kanitz (*T. orcostomum*, Stapf). Similar to *T. jasminoides* in habit, but differs in having slightly smaller buff or pale orange-colored fls. with exserted stamens, pointed in bud, and smaller lvs. Japan, Korea. G.W. 12, p. 415.—It is more hardy than *T. jasminoides*.

WILHELM MILLER.

TRACHYCÁRPUS (Greek, *rough* or *harsh* and *fruit*). *Palmaceæ*, tribe *Corypheæ*. Indoor and outdoor palms, one of which is widely grown and very hardy.

Tall unarmed palms: lvs. suborbicular or reniform, folded, many-cut; segms. narrow; rachis none: spadices many between the lvs., stout, branched; spathes many, sheathing, coriaceous, tomentose, compressed; bracts minute: fls. small, polygamomonoecious; sepals 3, ovate; petals 3, broadly ovate, valvate; stamens 6; carpels 3: drupes 1-3, globose or oblong.—About 4 species, Himalayas, China, and Japan. Monographed by Beccari in *Webbia* 1:41-72 (1905).

Fortune's palm (*T. excelsa* or *T. Fortunei*) is grown both indoors and out in America wherever palms are grown, although it is not one of the most popular species with northern florists. It is grown throughout California and even as far north as Oregon. It is commonly known by the name of Chinese windmill palm in southern California. There are two types of trachycarpus, those which have the trunks covered with old leaf-sheaths—the Himalayan type—and those which have smooth polished trunks—the far-eastern species.

excelsa, H. Wendl. (*T. Fortunei*, H. Wendl. *Chamærops excelsa*, Thunb. *C. Fortunei*, Hook. f.). FORTUNE'S PALM. Fig. 3827. Trunk robust, clothed with old lf.-sheaths: lvs. nearly orbicular; segms. numerous, ensiform: fls. clustered 2-4 on a tubercle: fr. transversely globose-reniform, deeply umbilicate. Upper Burma, China, and Japan; will grow in the open in Ga., withstanding 10° F.—This description follows Beccari, who refers *T. Fortunei* to *T. excelsa*. Hooker in founding *T. Fortunei* (B.M. 5221) speaks of it as a more robust tree than *T. excelsa*. The latter (which is from Japan) is said to have smaller and stiffer lvs., less deeply divided (usually only about to middle) with stiff segms., while *T. Fortunei* (China) has lvs. divided much below the middle (as in Fig. 3827), and the segms. more flaccid at least in older lvs. This group needs further study botanically, and also horticulturally in this country.

Martiàna, H. Wendl. (*T. Khasiàna*, H. Wendl. *Chamærops Martiàna*, Wall.). Trunk slender, tall, annulate-scarred, for the most part naked: lvs. nearly orbicular, divided to the middle into numerous segms.: female fls. solitary, sessile: fr. oblong-elliptic, rather compressed, rounded at both ends; seeds deeply sulcate. Himalaya region, Khasia, Burma, and Assam.

3827. *Trachycarpus excelsa*. The leaves finally become 4 to 5 feet across.

nàna, Becc. Subcaulescent: lvs. deeply many-parted, glaucescent beneath; segms. shortly bidentate at the obtuse apex: female fls. globose-ovate: fr. reniform, umbilicate and superficially sulcate. China.

Tàkil, Becc. Trunk robust, strongly clothed with old lf.-sheaths: lvs. persistent, nearly orbicular; segms. numerous, ensiform, shortly bifid or deeply and irregularly 2-parted: female fls. clustered 2-4 together: fr. transversely reniform, deeply umbilicate. Himalayas.

F. TRACY HUBBARD.

3828. *Trachymene caerulea*.

TRACHYLÒBIUM (Greek, *rough* and *pod*; the upper surface of the pod is tuberculate-roughened). *Leguminosæ*. Unarmed trees: lvs. with 2 lfts. which are coriaceous; stipules caducous: fls. white, panicked at the ends of the branches; calyx-tube disk-bearing, narrow-turbinate, segms. 4; petals 5, sometimes the 3 upper clawed and suborbicular, the 2 lower minutely scale-like, sometimes all subequal and clawed; stamens 10, free; ovary short-stipitate: pod ovoid-oblong, thick-coriaceous, warty-rugose, indehiscent.—Three species, Trop. Afr., Mascarene Isls., and Trop. Asia. *T. verrucosum*, Oliver (*T. Hornemannianum*, Hayne). Tree wholly glabrous excepting the tawny or silky pubescent inf.: lfts. 1-paired, obliquely oblong or elliptical, acuminate or apiculate: panicles overtopping the lvs.; calyx-segms. obovate-elliptical or oblong; petals posterior and lateral subequal, anterior equal or rudimentary: pod 1-2-seeded, oblong or obovoid, 1½-2 in. long. Mozambique and Madagascar. Gt. 51, p. 633. *T. verrucosum* has the anterior petals nearly equal the rest; *T. Hornemannianum* has them rudimentary.

F. TRACY HUBBARD.

TRACHYMÈNE (Greek, *rough membrane*, alluding to the fr.). *Umbelliferae*. Hirsute or rarely glabrous annual or perennial herbs, used as garden annuals: lvs. ternately dissected or rarely undivided; stipules none: umbels simple: fls. white or blue; calyx-teeth minute or obsolete, rarely 1-2, subulate; petals entire, obtuse; disk flat; fr. laterally compressed, usually flat.—About 25 species, mostly Australian but a few from Borneo, New Caledonia, and Celebes.

caerulea, R. Graham (*Didiscus caerulea*, DC.). Fig. 3828. An erect annual about 2 ft. high, somewhat

hairy: lvs. 1-2-triparted, with linear, acute, 3-cut lobes: peduncles long, bearing an umbel 2-3 in. across of very numerous blue fls.; calyx-teeth obsolete; petals unequal, the external being longer. July-Oct. Austral. B.M. 2875. B.R. 1225. G.C. III. 49:114. G. 29:127. Gn.W. 25:327.

F. W. BARCLAY.

TRADESCANTIA (named for John Tradescant, gardener to Charles I; died about 1638). *Commelinaceae*. **SPIDERWORT.** Perennial hardy herbs, varying greatly in habit from erect and bushy to trailing and rooting at the nodes, grown for their ornamental value both out-of-doors and in the greenhouse.

Stems simple or diffusely branched: lvs. various: cymes simple, sometimes umbellate or densely paniculate: fls. more or less pedicelled, few or numerous, rarely solitary, red, blue, or white; sepals distinct, concave, green or colored; petals distinct, obovate or orbicular; stamens 6, all usually perfect; ovary 3-celled with 2 superposed ovules: caps. loculicidally dehiscent.—About 90 species, all American, ranging from Manitoba to Argentina. The genus was monographed in 1881 by C. B. Clarke (DC. Monogr. Phaner. 3). The genus *Zebrina*, usually confounded with this by gardeners, differs, among other things, in having a tubular perianth.

To horticulturists, tradescantias are known as hardy herbs, coolhouse plants, and warmhouse plants. *T. virginiana* is the best known of the hardy species, withstanding the climate of the northern states. The wandering Jew of greenhouses and hanging-baskets, usually known as *T. tricolor*, is partly *T. fluminensis* and partly *Zebrina pendula*. *T. Reginae* is perhaps the best known warmhouse species at present, although various species may be expected in botanic gardens and the collections of amateurs. The glasshouse species are essentially foliage plants. Several species have handsomely striped leaves. All tradescantias are free growers, propagating with ease from cuttings of the growing shoots.

A. Plant prostrate, rooting at the joints.

1. *fluminensis*, Vell. (*T. mundula*, Kunth. *T. albiflora*, Kunth. *T. repens*, *T. repens vittata*, *T. viridis*, *T. viridis vittata*, *T. viridis Goeschkei*, *T. prostrata*, *T. procumbens*, *T. striata*, Hort. *T. tricolor*, Hort., in part. *T. myrtiflora*, Hort.). **WANDERING JEW** in part. Figs. 3829, 3830. Glabrous, with shining sts. and lvs., the nodes conspicuous, trailing, or the ends of the shoots ascending: lvs. ovate-acute, without distinct petiole, ciliate at the very base, the sheaths $\frac{1}{4}$ – $\frac{3}{8}$ in. long: fls. white, hairy inside, the 6 stamens all alike, borne several together in a sessile cluster subtended by 2 unequal lvs. or bracts, the pedicels not all of same age. Cent. Brazil to Argentina. Gt. 16, p. 297. G.W. 13, p. 558.—One of the commonest of greenhouse and basket-plants. In greenhouses, usually grown under the benches. When the plants grow very vigorously and have little light, they are usually green, and this is the form commonly known as *T. viridis*. There are forms with lvs. striped yellow and white, but these colors usually do not hold unless there is abundance of sunlight. In light places, the lvs. become red-purple beneath. Very easily prop. by cuttings or pieces of shoots at any time

of the year. The plant needs plenty of moisture in order to grow vigorously. Three plants are known as wandering Jew, and although they belong to 3 genera, it is not easy to tell them apart when not in flower (Fig. 3830). These plants are *Tradescantia fluminensis*, sheaths hairy or ciliate only at the top, fls. white; *Zebrina pendula*, sheaths hairy throughout or at least at base and top, lvs. redder beneath and always colored above, fls. rose-red; *Commelina nudiflora*, sheaths glabrous, fls. blue. The first two are tender to frost; the last is hardy in the open ground in Cent. N. Y. All of them are used for baskets and vases. The first two are best known and are the plants commonly called wandering Jew. All of them may have striped foliage. See *Commelina* and *Zebrina*.

AA. Plant erect, or ascending from a decumbent base.

B. St. none, or scarcely rising above the ground.

2. *fuscata*, Lodd. (*Pyrrhema Loddigesii*, Hassk.). Stemless, brown-tomentose or hairy: lvs. 6-8 in. long, oblong-ovate, entire, about 7-nerved, short-petioled: fls. blue or blue-purple, 1 in. or more across, borne in the midst of the lvs. on very short pedicels; stamens 6. S. Amer. L.B.C. 4:374. B.R. 482. B.M. 2330.

3829. Wandering Jew.—*Tradescantia fluminensis*. (Natural size.)

BB. St. evident, usually branching (often very short in *T. brevicaulis*).

C. Lvs. distichous (in 2 rows).

3. *Reginae*, Lind. & Rod. Stiff-growing upright plant: lvs. lanceolate-acuminate, sessile, set closely on opposite sides of the st. and spreading nearly horizontally, about 6 in. long, the center purplish crimson, with feathered border, the space toward the margins silvery, the very edge of the lf. darker, the under side purple. Peru. I.H. 39:147; 40:173 (3); 41, p. 14. G.C. III. 11:699; 13:477. Gn.W. 8:693. R.B. 19:113.—Intro. into Belgium from Peru in 1870. Named for the Queen of the Belgians. It was intro. as *Dichorisandra Reginae*, which see, p. 1003.

CC. Lvs. not distichous (in several rows).

D. Infl. not peduncled.

E. Plants villous.

4. *brevicaulis*, Raf. Villous, 1 ft. or less high, sometimes nearly acaulescent: lvs. mostly from near the ground, linear-lanceolate, more or less ciliate: fls. about 1 in. across, blue or rose-purple, in a 4-12-fl. umbel; pedicel slender, 1-2 in. long; sepals ovate-lanceolate, villous. Ky. to Mo.

EE. *Plants glabrous.*F. *Blades ovate.*

5. *naviculàris*, Ortg. Stoloniferous: st. creeping, geniculate-ascending, glabrous: lvs. sessile, ovate, acute, glabrous: fls. bright rose, in terminal umbels which are sessile; sepals spreading, keeled; petals broadly ovate. Peru. Gt. 26:901.

FF. *Blades linear to lanceolate.*

6. *refléxa*, Raf. Slender, glabrous or nearly so: lvs. narrow, linear-attenuate from a lanceolate base: umbels terminal; bracts soon deflexed: fls. blue; sepals ovate-lanceolate, glabrous or with a tuft of hairs. Wet places, Ohio to Mich., Minn., Kans., Texas, and S. C.

7. *virginiàna*, Linn.; also spelled *virginica* (*T. monàna*, Shuttlw., not Heyne. *T. tímida*, Lindl.). COMMON SPIDERWORT. Erect, branching, 1-3 ft., glabrous or nearly so: lvs. conduplicate, very long linear-lanceolate (6-15 in. long), clasping; umbels several-fld., terminal, the pedicel recurving when not in bloom: fls. violet-blue, in various shades, 1-2 in. across, produced freely nearly all summer; sepals villous. N. Y. to S. D., Va., and Ark. B.M. 105; 3546 (as *T. caricifolia*). L.B.C. 16:1513 (as *T. elata*). J.H. III. 49:373. B.R. 26:42. H.U. 2, p. 129.—An exceedingly variable plant. Var. *álba*, Hort., is a white-fld. form. B.M. 3501. Var. *álba grandiflora*, Hort., is offered in the trade. Var. *álba mājor*, Hort., appears in the trade. Var. *atrosanguinea*, Hort., has dark red fls. Var. *cærúlea*, Hort., has bright blue fls. Var. *cærúlea plèna*, Hort., is a double-fld. form. Var. *cárnea*, Hort., is offered in the trade. Var. *coccínea*, Hort., has bright red fls. Var. *congèsta*, Hort., has purple fls. Var. *delicàta*, Hort., pale mauve. Var. *grandiflora álba*, Hort., is known in the trade.

Var. *mājor*, Hort., has double fls. which are about the size of the type. Var. *purpúrea*, Hort., is offered in the trade. Var. *rúbra*, Hort., has dark rosy pink or red fls. Var. *violácea*, Hort., has purple-blue or violet fls.

3830. Three kinds of wandering Jew. A, *Tradescantia fluminensis*: tender, sheaths hairy at top; flowers white. B, *Zebrina pendula*: tender; sheaths hairy at top and bottom; flowers rose-red. C, *Commelina nudiflora*: hardy; sheaths glabrous; flowers blue. ($\times \frac{1}{2}$)

8. *occidentàlis*, Smythe (*T. virginiàna* var. *occidentàlis*, Brit.). Slender, 1 ft. high: lvs. narrowly linear, involute, base often enlarged and scarious: fls. blue or roseate; sepals glandular-pubescent. Iowa to Neb., Texas, and New Mex.

DD. *Infl. peduncled.*E. *Fls. white.*

9. *geniculàta*, Jacq. (*T. hypophàea*, Koch & Bouché). Procumbent, sts. geniculate, elongate, pilose: lvs. ovate-

oblong, 7-10 x 4-6 lines, pilose, violet-brown beneath: fls. small, white, terminal; sepals ovate-lanceolate, base cuneate. Trop. Amer. G.W. 13, p. 558.

EE. *Fls. rose or purplish.*F. *Stamens unequal, 3 long and 3 short.*

10. *elongàta*, Meyer. Nearly glabrous, procumbent and rooting at the base, then suberect to the height of 1-2 ft.: lvs. lanceolate or oblong-lanceolate, acuminate, sessile, light glaucous-green above and striped with silver, reddish purple beneath: peduncles 1-5, terminal: fls. rose-colored, the sepals green. Trop. Amer.

FF. *Stamens all equal or nearly so.*G. *Lvs. narrowly linear: sts. tufted.*

11. *ròsea*, Vent. Slender and nearly or quite simple, glabrous, 12 in. or less tall: lvs. very narrow-linear: bracts short and scale-like: fls. $\frac{1}{2}$ - $\frac{3}{4}$ in. across, rose-colored. Md. to Mo. and south. Mn. 2, p. 36.

GG. *Lvs. lanceolate to ovate-lanceolate.*H. *Plant with a stout caudex.*

12. *Warscewicziana*, Kunth & Bouché (*Dichorisandra Warscewicziana*, Planch.). Fig. 3831. *Dichorisandra*-like, having a stout caudex or trunk, marked by l scars and finally branching: lvs. green, stiffish, 1 ft. or less long, clustered at the top of the st., recurving, lanceolate-acuminate: fls. lilac-purple, numerous in small crowded clusters along the branches of a panicle-like cluster. Guatemala. B.M. 5188. R.H. 1860, p. 136.

HH. *Plant without a stout caudex, more or less decumbent at base.*

13. *dracénoides*, Greenm. Roots fascicled, tuberous: sts. erect or nearly so, 8-20 in. high, simple or sparingly branched: lvs. lanceolate-attenuate to ovate-attenuate, 4-6 x $\frac{3}{4}$ -1 $\frac{1}{4}$ in., villous-pubescent, strongly ciliate: infl. an open, oblong racemose panicle: fls. rose; sepals oblong, apex rounded; petals obovate. Mex.

T. aureo-striata, Hort., is offered in the trade as a form with green lvs. striped with yellow.—*T. bengalensis*, Hort., occurs in the trade, having small, red, fleshy lvs. and blue fls.—*T. crassifolia*, Cav. (*T. iridescens*, Lindl.). Something like *T. virginiana*, but lvs. short and broad, oblong-ovate, ciliate, as also the st.: fls. 1 $\frac{1}{2}$ in. across, blue-purple, in terminal and axillary sessile umbels, the stamens all equal. Mex. B.M. 1598. G.W. 7, p. 91.—*T. Crassula*, Link & Otto. Somewhat succulent, ascending: lvs. thick, oblong and nearly or quite obtuse, glabrous except on the edges: fls. about $\frac{1}{4}$ - $\frac{1}{2}$ in. across, white, in terminal and lateral often stalked umbels, the calyx and pedicels hairy. Brazil. B.M. 2935. L.B.C. 16:1560.—*T. decora*, Bull. Foliage plant: lvs. long-lanceolate, dark olive-green, with a central gray band. Brazil.—*T. discolor* is *Rhæo discolor*, which see.—*T. dracænefolia*. "A noble and rapid-growing plant, with luxuriant and handsome foliage. The lvs. in many respects resemble a dracæna and are a deep green, marked with chocolate or black. . . . When fully grown the plant will send out long runners, bearing out tufts of lvs. at the end." John Lewis Childs, catalogue 1900.—*T. lækenensis*, Hort., is offered in the trade as a form with green and pink lvs.—*T. lanceolata*, Hort., is offered in the trade as having large, green, downy lvs.—*T. multicolor*, Hort. See *Zebrina*.—*T. quadricolor*, Hort. See *Zebrina*.—*T. spathacea*, Swartz., equals *Rhæo discolor*.—*T. superba*, Lind. & Rod., has oval-oblong acuminate, sessile lvs., which are dark metallic green with a white band on either side of midrib and are purple beneath. Peru. I.H. 39:155; 40:173, fig. 6. Gt. 46, p. 163. Perhaps not a *Tradescantia*.—*T. thuringia*, Hort., is said to have green-and-white lvs.; offered in the trade.—*T. variegata*, Hort., is *Rhæo discolor* var. *vittata*.—*T. versicolor*, Salisb., is *Rhæo discolor*.—*T. vulgaris*, Hort., occurs in the trade.—*T. zebrina*, Hort., is *Zebrina pendula*.

L. H. B.

F. TRACY HUBBARD.†

3831. *Tradescantia Warscewicziana*.

TRAGIA (from Hieronymus Bock [or Tragus], a German botanist, 1498-1554). *Euphorbiaceæ*. Herbs, sometimes twining and often with stinging hairs, rarely cult.: lvs. alternate, toothed or lobed: fls. monœcious, racemose, apetalous, inconspicuous; stamens simple, generally 3; styles united above the base, with the apex free: ovules 1 in each of the 3 cells.—About 50 species of tropical and temperate regions; related to *Plukenetia* and *Dalechampia*. *T. cannabina*, Linn., of Trop. Asia, is used for fiber to some extent. *T. volubilis*, Linn. **TWINING COWITCH**, of the W. Indies, has stinging hairs. Probably not cult. Several species of *Tragia* are native in the U. S. J. B. S. NORTON.

TRAGOPOGON (Greek for *goat's beard*). *Compositæ*. **GOAT'S-BEARD**. Erect biennial or perennial herbs with narrow grass-like leaves and heads of yellow or purple flowers, belonging to the ligulate section of the composite family (tribe *Cichoriaceæ*).

Mostly weedy plants with a tap-root: florets perfect, with slender style-branches and sagittate anthers; pappus composed of bristles in a single series; involucre cylindric or nearly so, with approximately equal-length bracts in a single row.—Between 30 and 40 species, native to S. Eu., N. Afr., and Cent. and S. Asia. One of them is cult. for its edible tap-root (salsify) and another is now a frequent weed in this country. The fls. of these open only in the morning.

A. Fls. purple.

porrifolius, Linn.

SALSIFY. VEGETABLE OYSTER. OYSTER PLANT. Figs. 3532, 3832. Tall strict biennial, sometimes 4 ft. high when in bloom, glabrous: lvs. keeled, tapering from a broad often clasping base: fls. showy, closing at noon or before, the outer rays exceeded by the involucre scales: peduncle thickened and hollow beneath the heads. S. Eu.—Naturalized in many parts of the country, often becoming a persistent weed. See *Salsify*.

AA. Fls. yellow.

pratensis, Linn. **GOAT'S-BEARD**. More or less branched, 3 ft. or less tall: lvs. as in the preceding: outer rays exceeding the involucre scales; rays yellow, showy, about $2\frac{1}{2}$ in. wide: peduncle scarcely swollen. A weed, from Eu. L. H. B.

TRAGOPYRUM LANCEOLATUM var. **LATIFOLIUM**: *Atraphaxis Muschketowii*.

TRAILING ARBUTUS: *Epigæa*.

TRAINING: *Pruning*.

TRANSPIRATION is the term applied to the escape of water from leaves and other parts of the plant in the form of vapor.

There is no closed "circulation" of sap in plants comparable to the streaming of blood in animals. Water which generally contains various mineral soil constituents in solution enters the roots, and most of it passes

upward through the stems directly to the leaves, where it is evaporated. In plants of a succulent character, the intake often exceeds the loss, and a large amount of surplus liquid may be accumulated in various organs, from whence it may pass to the leaves in times of drought.

The movement of water set up by transpiration carries water and the contained salts to the centers of food formation in the leaves, and the evaporation process facilitates exchange of gases with the air. The evaporation also tends to equalize temperatures. That an enormous amount of work is performed by the plant in transpiration may be seen when it is known that a single sunflower plant will evaporate a pint of water from its leaves in a single day, and about seventy times this much in the course of its development. A birch tree with 200,000 leaves will transpire from 700 to 1,000 pounds of water daily in the summer. A single oak tree will throw 120 or 130 tons of water into the air during the course of a season, and an acre of beech trees containing 400 to 600 specimens will transpire about 2,000,000 pounds in a single summer. It is estimated that 98 per cent of the energy derived from sunlight by leaves is expended in the work of transpiration.

To determine the exact amount of water transpired by a plant, a specimen not more than a yard in height, growing in a pot, may be used. Set the pot on a square of oilcloth, then bring the cloth up around the pot and tie closely to the stem of the plant. This will prevent evaporation except from the shoot. Now set the prepared plant on one pan of a scale, together with a small measuring-glass, and balance. Allow the plant to remain in the warm sunshine for eight hours, then note the amount of water which must be poured into the glass to reach the original level and restore the balance: this will represent the amount of transpiration.

To demonstrate that water actually does come from the leaf, cut off a small leafy shoot of any convenient plant and thrust the base of the stem through a piece of cardboard into a tumbler of water: seal the opening around the stem with wax or gelatine: then cover the exposed part of the shoot with another tumbler and set in a warm light place. Moisture which could have come only from the leaves will soon gather on the glass. Some transpiration occurs over the entire surface of the plant, although only about one-thirtieth as much is given off by the stem as from the same amount of leaf-surface.

The structure of the leaves is such as to facilitate transpiration. The interior of the leaf is made up of a great number of loosely arranged cells which evaporate water into the air between them. The air in the leaf communicates with the atmosphere through openings called stomata, which are generally placed on the lower side of the leaf. Consequently the watery vapor diffuses out through the stomatal opening. Near the outer end of the stomatal chimneys are guard-cells which undergo alterations in form that change the size of the opening of the guard-cells and modify the rate of water loss. The position and shape of the guard-cells are affected by the age of the leaf, turgidity of the tissues, wind, and sunlight. The rate of transpiration may also be affected by cutinization or other alterations in the cell-walls through which evaporation into the stomatal chambers takes place, or by the presence of colloids retentive of water in the cells.

Species characteristic of arid regions generally have limited waterproofed surfaces with a comparatively small number of stomata. This modification is exemplified by the cacti, which transpire not more than one three-hundredth as much water as a broad-leaved plant of the same volume; and such succulents may lose as little as one forty-thousandth of their total weight by transpiration in a day.

D. T. MACDOUGAL.

3832. Flowers of salsify or oyster plant.—*Tragopogon porrifolius*. ($\times \frac{1}{2}$)

TRANSPLANTING is a general term to designate the removal of living plants whereby they may become established in new quarters.

Transplanting may be performed when the plant is in a dormant condition, as in winter, or when it is still actively growing. Small herbaceous plants are usually the only ones that are transplanted when in a growing condition, and this only when the plants are living under special garden conditions where they may have the best of attention as to watering and shading. Considered from the standpoint of the plant, transplanting is always a violent operation, for it destroys a considerable part of the root-system, loosens the plant's attachment to the soil, and arrests for the time being a large part of its progressive vital activities. To overcome these dangers, the earth into which the plant is set should be well prepared and moist, so that the plant may quickly reestablish itself; part of the top usually should be removed to lessen transpiration, and with succulent and growing plants some shade should be provided for a time. The deeper and finer the soil, and the greater the quantity of moisture it holds, the more successful the transplanting operation will be, other things being equal. The operation is also more successful in humid regions, as in the Atlantic states, than it is in dry regions, as on the plains and westward. In the more arid parts of the country transplanting is performed as little as possible, whereas in the eastern part great quantities of annual and other garden plants are transferred from seed-beds to the open ground.

The successful transplanting of any plant depends in part on the condition of the plant itself. The younger the plant, as a rule, the better it withstands the operation. Herbaceous or growing plants that are relatively short and stocky and compact, transplant better than those that are long, "leggy," and weak. The stocky plants are better able to withstand the vicissitudes of inclement weather when they are transferred from a

protected place to the open air, and they probably also have more recuperative power to make new roots and to attach themselves again to the earth. Many plants may be "hardened off" or gradually injured to sun and cold before they are transplanted. The more frequently a given plant is transplanted the more readily it endures the removal. The root-system becomes close and compact and there is relatively less injury to the roots at each subsequent removal, providing a long interval does not take place between the operations.

3833. A transplanting-box, specially designed for melons. It is made of a "flat" or splint 14 inches long and 3¾ inches wide, bent at four corners and held in place by a tack. It has no bottom.

The success of transplanting also depends to some extent on the weather at the time the removal is performed. If cool, cloudy, and damp weather follows the transplanting, the plants are much more likely to live. Plants usually establish themselves more quickly in freshly turned soil, because it contains a relatively large amount of moisture. To bring the earth into contact with the roots, it should be firmed closely about the plants. This packing of the soil tends to bring the subterranean moisture upward where it may supply the roots; it also tends to increase evaporation from the surface of the soil and thereby to waste the water,

although much of the moisture is utilized by the plant as it passes upward. To prevent the escape of moisture from the surface of the soil, it is customary to cover the ground with a mulch, from 1 to 3 inches in depth, of litter, sawdust, leaves, or coarse manure. When practicable the water may be saved by keeping the surface well tilled, thereby providing a mulch of earth. See *Tillage*.

In dry weather it may be advisable to water newly set plants, particularly if they are green and growing fast, as tomatoes, cabbages, and other annuals. The watering may best be done at nightfall. The water should be applied in a hole or depression about the plant or at one side of it, rather than on the surface; and the following morning the loose fresh earth should be drawn over the roots in order to provide a surface mulch and to prevent the soil from packing. Of course, this particular pains cannot be taken in large field operations.

All kinds of plants can be transplanted, but some of them remove with great difficulty. In these cases the special skill which is born of experience with these particular plants must be invoked for success. The difficulties are of various kinds. In some cases the difficulty may be a tap-root system, as in the case of the black walnut and the hickories. In these instances the plant may be prepared a year or two in advance by severing the tap-root some distance below the ground by means of a spade or other sharp instrument that is thrust underneath the crown. In other cases the difficulty is the inability of the plant to make new feeding roots quickly, as in some of the *asiminas* or papaws. Such plants often may be treated like the tap-rooted plants; that is, the long cord-like roots may be severed at some distance from the crown a year or two before the plants are to be removed. In other cases the inability to be transplanted is probably due to the excessive rate of transpiration from the foliage. In these cases cutting back the top rather severely and providing shade may contribute to success. In some cases the difficulties are so great as practically to prohibit transplanting.

So-called transplanting machines have been perfected within the last few years for setting small herbaceous stuff, as cabbages, tobacco, and tomatoes. These are really vehicles, drawn by horses, that open a furrow and drop a small quantity of water when the plant is inserted in the furrow by the hands of an operator who rides on the machine. The plants, already prepared for setting, are carried in a tray or hopper, and the operator places these between guards which automatically measure the distance. These machines are particularly valuable in large areas where great quantities of plants are to be set, and also in hard and dry land where it is difficult to make the proper openings with the hand and also otherwise to supply the plant with sufficient water.

For most small plants that are to be reset in small quantity, the dibber is a most useful implement to expedite the operation. (Fig. 3834.)

Plants grown in pots and small shallow boxes transplant more readily than those raised in the open soil. Particularly is this true of pot-grown plants, for the bevel or slope of the pot allows the ball of earth to be "knocked out" readily. See *Potting*. Special transplanting-boxes are on the market, to be used instead of pots, for purposes of economy. These boxes are usually made of thin basket stuff and are thrown away when the plants are taken from them for transplanting. (Fig. 3833.) The seeds are sown directly in these boxes. Melons, cucumbers, and other plants that are difficult to transplant are often grown on pieces of inverted turf, taken from old pastures.

In the case of large trees and shrubs, success often may be attained by transplanting in the winter, when a ball of frozen earth may be removed. It is usually better to give the transplanting of large trees into the hands of an expert than to attempt to perform it with

unskilled help and inefficient appliances. Only a certain proportion of the efforts in transplanting very large trees are really successful. The trees may live for several years and yet never fully recover or make satisfactory subjects. The surest and best results are usually secured only when the trees are nursery-grown and have been transplanted two or three times within a few years of their final removal. There are some species that remove from the wild with relative ease when they are of large size, among which are elms, maples, pin oak, basswood; but the large number of species do not readily recuperate from the operation. See *Arboriculture*, Vol. I, page 362.

It is sometimes said that a plant cannot recover from the transplanting operation, that the severing of the roots inflicts injuries that are not outgrown, and that a new type of root-system develops. These fears appear to be groundless. In many cases the plant does not regain itself, but these instances are probably due to lack of skill in the operation rather than to any inherent difficulty in the transplanting process itself. But even if the transplanting process were found to be theoretically injurious, nevertheless it must be employed in the practice of modern horticulture. L. H. B.

3834. A dibber. One of the most useful implements to aid in the transplanting of small plants. The plant is dropped into a hole made by the dibber; this hole is closed by inserting the dibber at the side and moving it against the plant.

TRANSPORTATION of horticultural products. Commercially, fruits and vegetables are grown primarily for profit. Whether the business of fruit- or vegetable-growing results in profit or in actual loss to the grower depends on a great many factors. Among the more important are quality and quantity of production, distance from markets, cost of transportation, the condition in which the produce reaches the markets, methods of marketing, and the supply and demand.

In present-day fruit-growing, especially when the localities of production are often thousands of miles distant from the larger markets, there is no factor of greater importance than rapid and efficient transportation. Every fruit-grower is, or should be, aware of the necessity of safe and rapid transportation, together with the delivery of perishable produce at the markets in sound attractive condition. Soundness and freedom from decay or deterioration are fundamental to profitable marketing, therefore to successful fruit-growing. All the labor and moneys invested in production are wasted if the products cannot be transported and delivered in good condition.

Transportation is the link that connects the producer with his market, his zone of distribution being determined largely by the cost of transportation and absolutely by the distance over which the produce can be shipped in sound marketable condition. This distance will necessarily vary with the variety of fruit, the localities in which grown, cultural methods, care exercised in handling and preparing it for shipment, the promptness with which it is cooled, and the temperatures maintained in transit. The factors above mentioned are the more fundamental ones governing the condition of horticultural produce in transportation. It is clear, therefore, that successful transportation depends not only on conditions in transit but on the prehandling of the produce prior to shipment. The responsibility for the condition of these products when delivered at the markets is a common one as between producers,

shippers, and carriers. The very best refrigeration that is practicable cannot be expected to deliver perishable products in sound merchandizing condition that have been badly handled prior to loading or shipment. Nor can such produce properly handled be delivered in good marketable condition without adequate refrigeration in transit during warm weather or sufficient protection against freezing in the cold weather.

The railways of the United States annually pay out millions of dollars in claims on account of breakage, decay and deterioration, freezing, and other damage in transit of perishable produce. This does not begin to cover losses sustained by the shippers in claims that are not paid, or deterioration for which no claims are made, and the injurious effect on the price received for the produce actually sound. The economic losses to consumers, carriers, shippers, and producers, especially consumers and producers, who finally shoulder the greater part of the burden, are enormous. This great wastage of the nation's food-supply is an important factor in the high cost of living and is very generally one of the main reasons for losses instead of profits to the growers or producers. The most important fact in this connection is that most of these losses are unnecessary and preventable. As the decay and consequent losses occur in transit, it is of the greatest importance that growers, shippers, and carriers have a clear and accurate knowledge of the fundamental factors governing condition of fruits and vegetables in transportation.

Few commodities are more subject to decay and deterioration in transit than are fruit and vegetable crops. In considering the transportation of these products and their behavior in transit, it is absolutely essential that the fact be kept in mind that fruit and vegetables are living organisms with a definite span of life beginning in the orchard or field and ending normally in actual death-decay. It must be remembered, therefore, that, in preparing these products for shipment, in transportation, and through all stages to the ultimate consumer, one is dealing with real organisms, the life-span of which will be lengthened or shortened by methods of handling and conditions in transportation. A correct interpretation of the reasons for the losses from decay and deterioration in transit depends on accurate knowledge of types of troubles that destroy the market value of fruits and vegetables. The prevention of these losses must be based on a clear understanding as regards the relation of the development of these troubles to methods of handling prior to shipment, and to temperature conditions in transit. The types of troubles that may destroy or lessen the value of these products are of two kinds, decay and skin-blemishes. In ordinary transportation the former is by far of the most importance, while in storage skin-blemishes may be very important factors. Decay may result either from attacks by fungous or bacterial organisms, or through physiological breakdown which may be termed natural death decay. The organisms causing decay in transportation may for convenience be divided into two groups, those which are parasitic, or which may cause decay of sound uninjured fruits, and those which are saprophytic or which have not the power to attack the sound unbroken skin of fruits or vegetables. Parasitic fungi causing decay in transit are usually orchard or field diseases that ordinarily can be controlled through proper cultural sanitation practices in the fields or orchards. Saprophytic organisms are responsible for by far the largest proportion of losses due to fungous decay in transportation and can be controlled only through careful and correct handling methods in the harvesting and preparation of the fruit for shipment.

Physiological breakdown or death-decay hinges largely on proper handling methods and temperatures

in transportation. It is plain, therefore, that the fundamental factors influencing, to the greatest extent, the behavior of fruits and vegetables in transportation come under the following heads: (1) Cultural; (2) maturity at time of picking; (3) care exercised in all handling operations; (4) promptness of cooling; precooling; (5) temperatures in transportation.

Cultural history of the crop.

In so far as cultural practices determine the crop's freedom from disease when harvested and its inherent keeping quality, are cultural operations responsible for condition of these crops in transportation. Of especial importance are the methods of orchard or field sanitation. Field or orchard diseases attacking growing fruits or vegetables very often cause serious decay in transit. Peaches from orchards or sections affected with brown-rot (*Sclerotinia*) or *Monilia* usually show serious development of brown-rot after shipment. In certain humid sections of the Pacific coast, for example, the prevalence of brown-rot makes long-distance shipment of cherries and fresh prunes an extremely hazardous venture. Certain vegetable crops, such as lettuce, celery, and tomatoes, when transported long distances, sometimes develop serious decay in transit through diseases that attack the growing crops in the fields. Decay in transportation, caused by diseases commonly affecting crops in field or orchards, can be controlled only through proper orchard- and field-sanitation practices. While the rapidity of the development of such decay in transportation can be controlled, to some extent, by quick prompt cooling and the maintenance of very low temperatures, the only real preventive lies in the control of these diseases in fields or orchards.

Maturity at time of harvesting.

The picking-maturity of peaches, muskmelons, and other quick-ripening fruits is governed largely by the distance from market and general experience as regards the carrying quality of such fruits at different stages of maturity under ordinary refrigeration. When they are to be shipped for considerable distances, the usual practice is to pick and pack them while still so green, hard, and immature as to be unfit for immediate consumption. Sometimes they are harvested in such a green state that they do not properly ripen in transit, and while not entirely worthless from a marketing standpoint, their poor eating quality necessarily results in very low prices. Fruits from certain sections have undeservedly gained a reputation for poor quality because the consumers never have had an opportunity to taste any properly matured fruit. There is no questioning the fact that if the quick-ripening fruits entering into long-distance transportation could be harvested at much nearer full maturity, that is, hard-ripe, and transported to the consumer in sound condition, both producer and consumer would benefit greatly, the former in increased returns, the latter in securing a more wholesome and palatable fruit.

The reason for the present condition is largely found in the notion that such fruits must be picked while still very green and hard to carry in sound condition to the market. To some extent this idea is well founded. Greater care, however, in all handling operations, with prompt cooling, will enable growers and shippers successfully to handle the quick-ripening fruits at more advanced stages of maturity. When precooling facilities are available, it has been demonstrated that it is not only possible but practicable to harvest such fruits as peaches and pineapples at advanced stages of maturity as will give the consumer a product possessing its maximum fine quality and wholesomeness. When such facilities are not available, much can be accomplished toward the same end through proper and careful handling, prompt loading, and the stowing of the load in the car in such a way as to facilitate cir-

culatation and consequent quick cooling or refrigeration. The practicability of successfully transporting more nearly tree- or plant-ripened fruits, possessing the maximum fine quality of the variety when delivered to the consumer, will depend both on the grower and the carrier. The grower must exercise, first of all, the greatest care in handling and get his fruit under refrigeration quickly. The carriers must provide refrigeration facilities in which the product can not only be cooled faster but transported at lower temperatures than is ordinarily obtained in the average equipment. What has been said above, relative to the desirability of harvesting certain fruits at much advanced stages of maturity, does not, of course, apply to such fruits as pears, lemons, and fruits or vegetables which should be picked green in order that they may possess their maximum fine quality when finally ripened or cured.

Care in harvesting and handling.

The care exercised in harvesting and preparing horticultural products for shipment determines, to the greatest degree, its shipping or keeping quality. Extensive investigations conducted on a commercial scale by the Bureau of Plant Industry, United States Department of Agriculture, for a number of years, covering a wide range of fruits and vegetables, have clearly and conclusively demonstrated that decay in transit and after arrival at the market is due very largely to rough methods of handling. The fungous organisms causing decay gain entrance through mechanical abrasions of the skin made in picking, hauling, packing, or other handling operations. Every injury or breakage of the cells of the skin offers lodgment for fungous spores which, given proper moisture and temperature conditions, germinate and produce decay. Both high temperatures and moist atmosphere favor rapid development and growth of these organisms. Temperatures are usually fairly high during the harvesting season, as is frequently the humidity. During periods of muggy or rainy weather, the conditions are ideal for the germination and development of fungous spores, and almost every injury is certain to result in decay. The fundamental consideration, therefore, in all handling operations is the preservation of the skin in a sound and unbroken condition.

Nearly all growers and handlers of fruit or vegetables realize that rough handling, resulting in mechanical abrasions of the skin, is more or less responsible for decay occurring in transit. Few, however, have a clear idea of the extent of mechanical injuries made in ordinary commercial handling, nor do they realize fully the importance of the most careful work, or what constitutes proper and careful handling of a perishable product. In a short article it is obviously impossible to go into details as to how injuries are made in handling from field to car. The handling operations involved in the harvesting and preparation of the citrus fruit crop for shipment may serve as a very good example. In the harvesting of citrus fruits the mechanical abrasions may result from cuts made by the clippers used in severing the fruits from the tree, from contact with thorns on the trees, from dropping the fruits into the picking-sack or field-box, rough handling in loading, and jarring in hauling over rough roads or on springless wagons. Additional injury may result as the fruit goes through the washing-machines, brushes and driers, and over the sizers, and into the bins. Long sharp stems also cause much injury as the fruits roll against one another in the picking-sack, field-box, and the various operations of washing, drying, grading, and sizing. The pickers and packers, whose gloves are not worn, may cause much injury through finger-nail cuts. The washing of fruit in dirty water, or slow and incomplete drying, both afford ideal or favorable conditions for infection of every injury and the consequent development of decay. The so-called soft fruits require

even more careful handling to avoid bruising and to preserve the skin of the fruit in a sound unbroken condition through all the operations of picking, hauling, and packing. Peaches are very commonly injured through the pickers exerting too great pressure with the thumb or other fingers when removing the fruit from the tree, by rough handling in loading, and bruising in the various operations of grading and packing. While sizers or graders have been used to a considerable extent in the handling of peaches, most of the graders now in use afford too many opportunities for injury to be universally recommended in the handling of such crops. In red raspberries, for example, the most serious decay results from too great pressure on the berry when removing it from the core. The use of three fingers instead of two minimizes the pressure and danger of injury. The inclusion of over-ripe berries in cups or crates intended for long-distance shipment is also a very prolific source of decay. The marketing or distributing zone of such fruits and berries can be extended by several thousand miles by the exercise of a little

transit. Too much emphasis cannot be laid on quality as the tendency is at present decidedly in the direction of attaching too much importance to quantity. Quantity at the expense of quality is poor economy in the handling of any perishable fruit crop.

There is considerable question and argument as regards the best picking-receptacle, particularly as to whether picking-sacks or -bags are preferable to pails or baskets or other similar containers. For citrus fruits, and other hard thick-skinned deciduous fruits, canvas picking-bags are usually preferable. Peaches and other thin-skinned fruits, that are very liable to injury by the rubbing of one fruit against another, ought to be picked in receptacles with rigid sides. In such receptacles the fruits will not be subjected to more or less rubbing against one another as they would be in a picking-bag where every fruit necessarily moves somewhat with the movement of the picker.

Quickness and promptness of cooling.

Next to care exercised in the physical handling of the fruit, temperature is the most important factor in determining the life-span of the fruit. The question of temperature in the handling of fruits for transportation is related primarily to the promptness and rapidity with which the produce is cooled and the maintenance of low temperatures in transit. Most of the fruits and vegetables are harvested during periods of high temperatures. The physiological and chemical changes

that constitute ripening proceed very rapidly at high temperatures and but very slowly at temperatures slightly above freezing. High temperatures shorten the life-span of the fruit, both through rapid ripening and the rapid development and growth of decay-producing organisms. The low temperatures retard the ripening processes as well as the germination and growth of fungi causing decay. It is, therefore, of the greatest importance that the produce be cooled as promptly and quickly as possible after removal from the tree or field. Delay of a few hours of the more quick-ripening fruits after harvesting in the field or packing-house during the heat of the day may mean the shortening of the normal life-span of such fruits by days. Prompt cooling

is essential, whether this is accomplished by precooling before shipment or slower cooling in a refrigerator car. Advantage also may be taken of cool night temperatures by allowing the fruit to remain unpacked out in the open over night and packed later in the cool of the morning. More cooling can usually be accomplished this way over night than in a whole day in a refrigerator car, especially if the fruit is wrapped and tightly packed.

Precooling.

The prompt quick cooling of produce prior to shipment has been termed "precooling." It is usually accomplished by mechanical means in warehouse plants before loading in cars, or in car-precooling plants after loading. In the latter case the precooling is accomplished by forcing large volumes of cold air through the load in the car. More recently smaller warehouse plants have been built and successfully operated using ice and salt for refrigeration. As to which system is the best is still more or less of an open question and depends largely on local conditions. Warehouse plants have the advantage in so far as the cooling of the produce can be commenced immediately after packing without any delay. The cooling is usually more uniform and very often the plants are used as warehouses to hold fruits and vegetables in good condition for considerable periods when, on account of market conditions, or for any other reason, it is desirable to do so. Mechanically cooled warehouse-precooling

3835. Icing cars (at the top) at one of the stations of the Fruit Growers' Express, Georgia.

more care in picking and grading. In grapes the most serious injuries result from the loosening of the berry from the pedicel, and it requires the most careful handling, both in picking and packing, to avoid this type of injury which is chiefly responsible for the frequent excessive decay occurring in transportation.

Careful handling involves the exercise of thoughtfulness in the manipulation of the fruit from tree to car in order to preserve the skin of the fruit in an unbroken sound condition. It necessitates the most careful supervision of labor. It means simple and the minimum amount of machinery for washing, drying, sizing or grading, and constant attention to keep it clean and in perfect order. The whole handling problem is an economic one related to systems of both hiring and supervising labor. In citrus states coöperative associations have found it necessary to take over the field handling as well as the packing-house handling to insure uniformity of careful work. Where each grower does his own picking, the bad handling of one nullifies, to a large extent, the good work of the other, especially if the fruit from the different growers is pooled and shipped in the same cars. The success of this method of coöperative handling depends largely on having the right kind of manager and foreman, men who not only know what careful handling is and means, but who can secure such work from every man in the organization having anything to do with the physical handling of the fruit. The system of paying labor is largely responsible for carelessness in handling and decay in

plants are expensive to build and operate, and where the harvesting-season is short, the benefits from precooling must be very marked to justify the expense. The salt and ice plants were designed to meet this objection and have proved very practicable where ice can be obtained at a reasonable cost and where the daily output does not exceed a few cars. The principal objections to car-precooling plants are the delay between loading and precooling and the more or less unequal cooling of the different packages in the car. The delay incidental to finishing the loading of a car, and the switching to a precooling plant is sometimes considerable and, in some instances, the total delay may approximate, to some extent, the slow cooling under regular refrigeration. In a number of instances, where car-precooling plants are in operation, in order to minimize delays, there is too much of a tendency to cut down the actual period of precooling, which results in partial precooling only. Some of the reasons why precooling is not more universally utilized may be found in the rather heavy initial investment necessary to build a plant, and the delay in shipment necessitated by holding over for precooling. Especially is this true with deciduous fruits where, in many sections, the shipping-season is short and where each shipper is desirous of getting his fruit or produce to the market as quickly as possible.

Precooling has been utilized more in connection with the handling and shipment of citrus fruits from California than anywhere else. It has apparently been found to be profitable in the citrus industry largely because of the long orange shipping-season, and for the reason that it is utilized also to reduce the cost of transportation. Precooled fruit from the growers' warehouse plants is shipped with initial icing only during the winter and spring season, the combined cost of precooling and one icing being somewhat less than the regular refrigeration rate. In Florida, precooling of citrus fruits is more in the experimental stage. Owing, however, to the short haul in warm territory in winter, precooled fruit is usually shipped successfully without any icing whatever. Comprehensive experimental precooling investigations on a commercial basis have shown decidedly favorable results from the thorough precooling of lettuce and celery from Florida. The principal berry-growing sections in California and Washington have utilized precooling for several years with the result that they have been able not only to transport berries, such as red raspberries and loganberries, in better and sounder condition, but to widen their marketing territory greatly.

In a number of cases in which precooling has been tried on a commercial basis, the physical handling of the fruit has been too careless to result in any marked advantage from precooling. This serves to illustrate very forcibly that precooling should not be depended on to overcome difficulties arising from improper handling. Another factor of no little importance is the inability of the average refrigerator equipment to maintain sufficiently low temperatures, even under full icing, especially in the upper tiers, in transportation. The good effects of quick and prompt cooling have been nullified to a considerable extent by the rapid rise in temperature of fruits or produce while in transportation. No matter what system is employed, the full value cannot be obtained from precooling unless the produce has been properly and carefully handled in the first place. Used as a means to overcome the effect of rough handling, precooling only retards decay and deterioration and simply transfers the troubles from the first receiver at the market to the retailer or consumer. Precooling must be thorough and as uniform as possible. The refrigerator car used for the shipment of precooled produce should be sufficiently insulated to maintain reasonably low and uniform temperatures in transit.

Temperatures in transit.

The necessity for the maintenance of low temperatures in transit has already been emphasized. The question is often asked: How low ought the temperatures in a refrigerator car to be for best results? The only answer to this question is: As low as possible consistent with safety from freezing. The same principle applies as in storage. The lower the temperature above actual freezing, the more effectively are ripening and the development and growth of decay-producing organisms checked. While most of them continue to grow very slowly at temperatures of 40° F. or below, few germinate at this temperature. If, however, germination has already taken place, the best that can be expected of refrigeration is to check their growth and development sufficiently to allow of sound delivery. The necessity for prompt and quick cooling is therefore very apparent.

The cooling in an ordinary refrigerator car is usually rather slow and very unequal. It requires from six days to a week thoroughly to cool a load of oranges in transit and several days to cool wrapped deciduous fruits. Unwrapped fruits in open containers cool relatively fast because of the opportunity for free air circulation around each individual fruit. The lower tiers cool relatively fast in any load, especially near the ice-bunkers. There are marked differences in temperature between the ends and middle of the car, and between the top and bottom tiers. In the quick-ripening fruits these temperatures are reflected in the condition of the fruit in the various positions in the car. Very often the upper tiers are 15° to 20° higher in temperature than the bottom tiers and have ripened to such an extent as to make it necessary or desirable to sell them separately from the remainder of the fruit in the car.

One of the principal problems in transportation and refrigeration of fruits and vegetables in transit is to secure quicker and more uniform cooling throughout the car. This can be done, to some extent, through methods of loading and stowing and care exercised at time of loading to retain as much as possible of the refrigeration within a pre-iced car. With deciduous fruits and vegetables, cars intended for loading should be pre-iced several hours before loading begins.

The shipper in loading should not only stow the load so as to prevent shifting and breakage in transit but, first of all, so as to facilitate free circulation from both ends to the middle of the car. If crates are used, this can be done by leaving straight uninterrupted aisles between rows from one end to the other. Cleats between each layer from bottom to top will also facilitate quicker cooling. Racks so constructed as to provide a space of 4 inches between rack and floor for free circulation of cold air from each bunker toward the middle of the car underneath the load will greatly facilitate quick cooling of every package in the load. In loading fruit into pre-iced cars, it is very commonly the practice to leave both doors open during the entire period of loading. Much of the refrigeration is lost in this way which could easily be conserved if more care was exercised to open the doors only when absolutely necessary.

In so far as methods of loading and stowing are concerned, the responsibility for the safety of the load and, to some extent, its quick cooling rests on the shipper. The other factors, however, in actual transportation that have to do primarily with quick cooling and the maintenance of low temperatures in transit and freedom from breakage are factors for which the carriers must share responsibility. When properly prehandled produce has been stowed and loaded correctly, both as regards liability to shifting in ordinary freight handling and as to facilitating air circulation and quick cooling, a shipper has largely fulfilled his responsibility so far as products in transportation is concerned. Following this, the responsibility for the safe transportation of properly loaded product rests almost entirely on

the transportation company, both as relates to freedom from breakage and efficient refrigeration. The care exercised in handling freight trains and cars in switching is mainly responsible for the condition of a properly stowed load as regards shifting, breakage, and the like. The efficiency of the refrigerator car is primarily responsible for the quickness of cooling and the maintenance of uniformly low temperatures in transit as well as liability to freezing damage in cold weather. The efficiency of a refrigerator car depends not only on the quantity, quality, and condition of insulation but on the size of the car, the kind of ice-bunkers, and facilities for effecting free circulation and quick refrigeration of all packages in the car.

Salt, as a means of securing lower temperatures in refrigerator cars, is in use extensively in the transportation of meats and similar products requiring temperatures below freezing. It has been used only very sparingly with fruits. Recent tests with somewhat modified equipment indicate that salt can be used to good advantage in securing quick cooling and in maintaining the necessary low temperatures in transit.

The methods of icing and charging for refrigeration in transit vary considerably in different sections of the country. From Pacific coast points to the East, the carriers, under certain blanket rates, assume all responsibility for refrigeration in transit from point of shipment to destination. In the deciduous fruit sections all cars, unless precooled, go out under standard refrigeration, that is, pre-icing before loading and full re-icing enroute at all regular re-icing stations to destination. The refrigeration rate is uniform on all cars to any one point. Under the standard refrigeration rate for citrus fruits, the cars are usually not iced until after loading unless otherwise requested by the shipper who pays a somewhat higher rate for pre-iced cars. With citrus fruits from California, various other rates are in effect permitting one pre-icing and a re-icing before final shipment, or precooling, and one icing with no re-icing in transit. When the growers do their own precooling and initial icing with no re-icing in transit, a charge is made only for the use of the car and freight on the ice hauled in the bunkers. In the shipment of fruits from Florida there is not only the standard refrigeration rate which calls for full re-icing at the designated icing stations enroute, but there is also another rate for half-icing, which means the refilling of the bunkers at the various icing stations to one-half of their capacity, the racks on the floors of the bunkers being raised so as to hold the ice in the upper half of the bunker. In the eastern states the so-called blanket refrigeration rate to various points is not used to any considerable extent in the shipment of fruits and vegetables. The refrigeration charge to the shipper is usually based on the amount of ice consumed in transit as shown by the carriers' records at icing stations. The shipper pays for the ice actually used and the icing is done according to the instructions furnished by him on the bill of lading. If the shipper orders full refrigeration in transit, the cars are re-iced at the regular icing stations. The shipper, however, has the option of giving other instructions if he so desires, namely, either the number of icings enroute or the icing stations at which he wishes the cars to be re-iced. Under the standard refrigeration rates, applying from the Pacific coast territory, the responsibility for refrigeration in transit rests entirely with the carriers. In eastern territory the responsibility is divided between the shipper and the carrier.

Freezing in transit.

The transportation of fruits and vegetables in sound condition in transportation is related not only to efficiency of refrigeration but protection against freezing. During protracted periods of cold weather, such as sometimes occur in the northern and eastern states

in the winter, the protection of fruits and vegetables in transit is a real problem. While a number of factors enter into the question of freezing protection in transit, the principal one is insulation. Aside from condition and quantity of insulation, shippers and carriers have both attempted to minimize the danger from freezing by heavy tight loading and lining the inside with heavy paper, sometimes using several thicknesses, by putting in floor-racks and by placing stoves in the bunkers or in the middle of the car.

Both tight and heavy loading are desirable when there is danger from freezing. The tight load tends to hold the heat more effectively and the heavier the load the more heat there is to draw on. Lining with heavy building-paper, or other paper of similar character, gives added protection. Certain roads have found floor-racks of decided value in minimizing the damage from freezing. Results both experimentally and commercially fully justify their use to minimize frost damage as well as an aid to more effective refrigeration. The use of stoves or heaters is hardly to be commended, as frequently the injuries from overheating certain parts of the car result in deterioration as regards quality, condition, and appearance that exceed what the freezing damage would have been. In the transportation of potatoes during the colder months from northern states such as Maine, heater cars are used to a considerable extent. Ordinary freight cars with specially constructed bins so as to provide an air-space between floor and sides of car and the load are used very largely also. A stove is placed in the middle of the car and a messenger accompanies three, four, or more cars to keep the fires going properly. The heat from heaters either outside or inside the cars is depended on more than the insulation to maintain temperatures above freezing.

H. J. RAMSEY.

TRĀPA (abbreviated from *calcitrapa*, which is the same as caltrops, an instrument of war used to impede the progress of mounted warriors; it had four spine-like projections, like the fruit of the water caltrops). *Trapaceæ* or *Hydrocaryaceæ*; by some retained in *Onagraceæ*. Floating plants adapted to the aquarium.

Flowers small, axillary, solitary, short-peduncled; calyx 4-parted, the segms. persistent, sometimes spinescent; petals and stamens 4; ovary 2-loculed; ovules solitary, long, pendulous, affixed to the septum: fr. top-shaped, leathery or somewhat bony, 1-loculed, 1-seeded.—Three species, native to the warmer parts of the eastern hemisphere.

Trapa natans is one of the daintiest aquatics in cultivation. It is perfectly hardy and very desirable for aquaria, pools, ponds, or tub-culture. Its beautifully mottled or variegated foliage is very attractive. The flowers are white, small, and inconspicuous. The fruits are very large in comparison with the flowers and leaves, but they are hidden beneath the foliage until they ripen, when they drop off. They are good to eat raw, like chestnuts, and are sweeter and more palatable before the shell becomes hard. The nut is not likely to become of commercial importance in America. The seeds drop from the plant and remain in the pond all winter. Seeds must be kept in water or moist to retain their vitality. (William Tricker.)

nātans, Linn. **WATER CHESTNUT. WATER CALTROPS. JESUIT'S-NUT.** Petiole of floating lvs. 2-4 in. long, nearly glabrous; blade rhombic-orbicular, dentate in upper half, slightly villous along the nerves beneath: fr. 4-spined, but the 2 lateral ones shorter. Eu., Orient. Gn. 24, p. 557. G.C. II. 10:213. B.R. 259.—It has two kinds of lvs. The submerged ones are root-like, long, slender, and feathery. The floating lvs. form a loose rosette. The lf.-stalks are swollen and spongy near the apex. The fr. is an inch or two across and has 4 spinescent angles. It is roasted and eaten in some parts of Eu. like the common chestnut. It is sparingly

naturalized in this country. Var. *verbanensis*, Cesati (*T. verbanensis*, De Not.), of Lake Maggiore in Italy, has deltoid lvs. and compressed 3-angled fr. with 2 short horns.

bispinosa, Roxbg. SINGHARA-NUT. Petiole of floating lvs. 4-6 in. long, woolly; blade 2 x 3 in., slightly crenate in the upper half, very villous beneath: fr. $\frac{3}{4}$ in. thick, with 2 of the spines sometimes absent. India, Ceylon.—Said to yield very large and sweet nuts which are sold under the name of Singhara-nut; much used by natives.

T. bicornis, Linn. f., the Ling of China, is by some referred to *T. natans*: the fr. has 2 strong opposite long decurved horns like those of a bull's head.

WILHELM MILLER.

TRAUTVETTERIA (E. R. von Trautvetter, a Russian botanist). *Ranunculaceae*. Tall erect perennial herbs grown somewhat for their broad leaves and small white flowers borne in clusters.

Leaves broad, palmately lobed: fls. white, small, corymbose-panicleate; sepals 3-5, caducous; petals none: carpels many, forming 1-seeded achenes.—Two species, N. Amer. and E. Asia. Very hardy, thriving in ordinary or rich soil. Easily prop. by division of roots either in late fall or early spring. There is not likely to be much difficulty associated with this operation. Offered by dealers in native plants.

carolinensis, Vail (*Hydrastis carolinensis*, Walt. *T. palmata*, Fisch. & Mey.). Sts. 2-3 ft high: lvs. alternate, reticulated, radical ones very large, with lobes much toothed and cut. July. Pa., south and west. B.M. 1630 (as *Cimicifuga palmata*). G. 29:395.

grandis, Nutt. (*T. palmata* var. *occidentalis*, Gray. *Actæa grandis*, Dietr.). Much like the above species: lvs. membranaceous, more deeply lobed, often to the base, thin, sparsely hairy beneath along the ribs; reticulations less distinct: styles longer and somewhat curled. Wash., Idaho, Brit. Col.

The genus *Trautvetteria* is variously interpreted. Many authors regard it as monotypic, the Japanese form (*T. japonica*, Sieb. & Zucc.) being included in one cosmopolitan species (*T. carolinensis*). E. L. Greene, on the other hand, described 6 new American species at one time in 1912: *T. nervata*, from Ga.; *T. fimbriata*, from Ore.; *T. applanata*, Mo.; *T. rotundata*, Calif.; *T. saniculi-folia*, Idaho; and *T. media* from New Mex. K. C. DAVIS.

TRAVELER'S TREE: *Ravenala*.

TREE OF HEAVEN: *Ailanthus*.

TREES: *Arboriculture*.

TREE SURGERY: *Arboriculture*, Vol. I, page 354.

TREFOIL: *Clover*, *Trifolium*; sometimes applied to *Lotus*, *Desmodium* (tick trefoil), and other Leguminosae.

TRÈMA (Greek, *trema*, hole, alluding to the pitted stone). *Ulmaceae*. A group of about 30 species of evergreen trees or shrubs in the tropical and subtropical regions of the Old and New Worlds: lvs. alternate, short-petioled, serrate, 3-nerved or pinninerved, stipulate: fls. small, in nearly sessile clusters, monœcious or diœcious, apetalous, 5- or rarely 4-merous; sepals of staminate fls. valvate below, imbricate above; stamens 4-5; ovary 1-celled, superior style with 2 linear arms fr. a small ovoid or subglobose drupe; embryo curved or involute. Adapted for cult. in tropical and subtropical regions only and sometimes planted for its evergreen foliage. The first of the two species described below has been offered in Calif., the second in Fla.

bracteolata, Blume. Small tree, to 30 ft.: lvs. ovate-oblong to ovate-lanceolate, acute, rounded at the base, crenate-serrate, pubescent on both sides, more densely beneath, 3-nerved at the base, 2-4 in. long: fls. in small axillary clusters: fr. globose, black, $\frac{1}{2}$ in. long, crowned by the remnants of the styles. S. Afr. Wood, Natal Pl. 4:356.—It is said in Calif. that in deep soil it

makes a much-branched bushy tree with foliage similar to mulberries, and remarkable for the bright orange color of the old lvs. before dropping down.

orientalis, Blume (*Celtis orientalis*, Linn.). Small tree; branchlets pubescent: lvs. rigid, ovate-oblong to ovate-lanceolate, acuminate, cordate and 3-7-nerved at the base, crenate-serrulate, scabrid above, clothed with silvery, appressed pubescence beneath, 3-6 in. long: fr. ovoid, $\frac{1}{2}$ in. long, black. S. Asia. Wight, Icon. 1971.—A plant offered under this name seen by the writer proved to be a true *Celtis*, not a *Trema*.

ALFRED REHDER.

TREMÁNDRA (Greek, *hole* and *anther*; the anthers burst open through a hole). *Tremandraceae*. More or less stellate-tomentose shrubs, sometimes grown in the greenhouse. Lvs. opposite, ovate, dentate: fls. in 5's; petals not inclosing the stamens, which are rather in 1 row, dehiscing by a single somewhat 2-valved pore; disk glandular, crenate, almost 5-lobed: caps. loculicidally 2-valved.—Two species, Austral. *T. stelligera*. R. Br. Densely stellate-hairy, 2 ft. or more high: lvs. short-petioled, ovate, obtuse, 1-1 $\frac{1}{2}$ in. long, coarsely and irregularly toothed: fls. on pedicels shorter than the lvs.; sepals villous or tomentose. Austral. Rarely cult.

A plant is mentioned as in cult. under the name of *T. ericoides hirsuta*, Bedingh., but there seems to be some confusion and also doubt as to what it is. The plant in question has brown sts., small, subulate, heath-like lvs. and bright purplish pink drooping blossoms borne on rather long slender pink pedicels. Extra-Trop. Austral. R. B. 25:133.

TREVÈSIA (after the family Treves di Bonfigli of Padua, patrons of botany). *Araliaceae*. Showy and rather striking small trees or shrubs from Trop. Asia and the islands in that region: lvs. either palmately cut and simple, or digitately or pinnate compound: fls. rather large for the family and borne in panicle umbels; petals 8-12, valvate, somewhat thick; stamens 8-12; ovary 8-12-loculed: fr. large, ovoid.—About 9 species. Should be grown in a warm moist house, as the plants naturally grow in damp jungles.

palmata, Vis. (*Gastonia palmata*, Roxbg.). A small tree frequently 20 ft. in cult., with the ends of the branches sparingly prickly and the young parts tomentose: lvs. crowded at the ends of the branches, 1-1 $\frac{1}{2}$ ft. across, palmately 5-9-lobed to below the middle; petioles 1-1 $\frac{1}{2}$ ft. long: panicles long-peduncled, erect: umbels 6 in. through, long-stalked: fls. 1 in. across, yellowish white, showy. Himalayas. B.M. 7008.

T. Sanderi, Hort. Lvs. handsome, deeply cut, borne on long cylindrical petioles; lf-blade nearly circular in outline, 2 ft. across, digitate, the divisions irregularly pinnatifid and joined at the base. Perhaps a form of what is known in cult. as *T. Sundaca*, Annam. G.C. III. 53:295.—*T. sundaca*, Regel, is apparently a form of *T. palmata*; *T. sundaca*, Miq., is a distinct species from Java and Sumatra, with infl. becoming recurved. See Gilibertia.

N. TAYLOR.†

TREVIRÀNA: A section of *Achimenes*.

TREVÒRIA (named for Sir Trevor Lawrence). *Orchidaceae*. Epiphytic orchids, grown in the warmhouse.

Pseudobulbs elongated-pyriform, not compressed, 1-lyd.: lvs. large, rather leathery, folded, contracted to the petiole: scapes arising from the base of the pseudobulbs, simple, bearing a lax few-fl. raceme: fls. large, fleshy, pedicelled; sepals rather thick, free-spreading, lateral ones oblique, very large; petals fleshy, twisted, conspicuously narrower than the sepals; labellum fleshy, concave, erect, not movably jointed with the base of the column, lateral lobes erect, axe-shaped, laxly surrounding the column; midlobe linear-hastate; column rather long, terete, clavate or abruptly truncate at apex; rostellum 2-toothed, membranaceous; pollinia 2: caps. fusiform.—About 3 species, Trop. Amer.

Chlòris, Lehm. Laxly cespitose: pseudobulbs long-pyriform: lf. oblong-lanceolate, acuminate, long-

petioled: spike pendulous, few-fl'd., commonly 3: fls. fleshy, greenish; dorsal sepals, oblong-lanceolate, acuminate, revolute, lateral ovate, obliquely acuminate; petals ligulate-falcate, cuspidate; lip with the lateral lobes axe-shaped and the midlobe linear-hastate. Colombia. G.C. III. 21, suppl. May 29.

Lèhmänni, Rolfe. Pseudobulbs fascicled, cylindrical or elongate-pyriform, 1-lyd., not ribbed, covered by brown lanceolate sheaths below the middle: lfts. subsessile, oblong-lanceolate, plicate: spike pendulous, few-fl'd., rachis stout: fls. up to $2\frac{1}{2}$ in. across, green; sepals broad-ovate, subacute, concave, fleshy; petals much narrower than the sepals, oblong-lanceolate, spreading-recurved, paler; lip fleshy, lateral lobes ear-shaped, erect, midlobe 5-grooved, stipitate, swollen, 2-callused. Colombia. B.M. 7805 (as *T. Chloris*).

F. TRACY HUBBARD.

TRÈWIA (from C. J. Trew, a German physician, 1695-1769). Also spelled *Trèvia*. *Euphorbiaceæ*. Small tropical softwood trees rarely cult. in greenhouses, but little known to gardeners and apparently not in the American trade: branching from the base: lvs. opposite, entire, 3-5-nerved: fls. dioecious, in lateral racemes or the pistillate singly, apetalous; stamens simple, 50 or more; styles free above the base. About 5 species, mostly in Trop. Asia. Related to *Mallotus*. *T. nudiflora*, Linn., with broadly ovate, acute or acuminate, cordate to subcuneate lvs., has been in cult. in Eu. from S. Asia. It is prop. by cuttings in sand.

J. B. S. NORTON.

TRIÀNEA: *Limnobiom*.

TRIBRÔMA: *Theobroma*, p. 3331.

TRICALÝSIA (Greek, *triple calyx*; true of some species). Including *Kraussia*. *Rubiaceæ*. Erect or climbing shrubs, used as ornamentals in extreme South.

Branches opposite, terete or obtusely quadrangular: lvs. opposite, short-petioled; stipules short, broad, apiculate and intra-petiolar: fls. rather small, subsessile, shortly pedicelled, axillary; calyx-tube turbinate or campanulate, 4-6-lobed or shortly dentate; corolla funnel-shaped or shortly salver-shaped, lobes 4-8, oval, ovate, or lanceolate; stamens 4-8; disk annular, fleshy, glabrous; ovary 2- rarely 3-celled: fr. pisiform, berry-like, leathery, 1-2-celled, few-seeded.—About 65 species, Trop. and S. Afr., Madagascar; two intro. in Fla. and S. Calif.

A. Lvs. lanceolate, acuminate.

lanceolata, Hiern (*Kraussia lanceolata*, Sond.). Shrub: lvs. lanceolate, acuminate: cymes many-fl'd.: calyx 5-toothed; throat of corolla densely bearded; stigma deeply 2-lobed, lobes revolute: fr. globose, the size of a pea. Natal.

AA. Lvs. elliptic, obtuse.

Sonderiàna, Hiern (*Kraussia coriàcea*, Sond.). Shrub: lvs. elliptical, obtuse or minutely apiculate, wedge-shaped at the base, coriaceous, $1\frac{1}{2}$ - $3\frac{1}{2}$ in. long: cymes about 4-fl'd.: fls. pentamerous; pedicels $\frac{1}{2}$ - $\frac{3}{4}$ in. long; throat densely bearded; stigmas deeply 2-lobed, lobes revolute. Natal.

T. Kraussiàna, Schinz (Coffea *Kraussiana*, Hochst. *Kraussia floribunda*, Harv.). Shrub with reddish brown branches: lvs. ovate-oblong or lanceolate-subacute: cymes axillary, paniculate: corolla 3-4 lines long. Natal.

F. TRACY HUBBARD.†

TRICHÍLIA (Greek, *by threes*; the fls. are trimerous). *Meliaceæ*. Trees or shrubs, suitable for the greenhouse or outdoors in the extreme S. as ornamentals. Lvs. with 3 lfts. or uneven-pinnate; lfts. opposite or alternate, usually many-paired, rarely 2-paired: panicles many-fl'd., axillary: fls. large for the order; calyx short, 4-5-toothed or cleft; petals 4-5, erect or spreading; staminal tube 8-10-cleft or -parted; disk annular, free; ovary sunken in the disk, 2-3-celled: caps subglobose, leathery, 2-3-celled.—About 120 species, Trop. Amer. and Trop. Afr.

spondioides, Jacq. Tree, 15-20 ft. high: lvs. pinately compound; lfts. 7-10-paired, ovate-oblong, oblique and round at base, glabrous: panicles puberulent, divisions 3-11-fl'd.: fls. greenish yellow; staminal tube cohering one-third its length, anthers 10, hairy: caps. tomentose, rugulose, 5-6 lines diam. Trop. Amer. and intro. into S. Fla.

T. undulatifolia, Hort., is offered in the foreign trade.

F. TRACY HUBBARD.

TRICHÍNÍUM (Greek, *hairy*, alluding either to the plant in general or to the fl.-heads). *Amarantaceæ*. Herbs, subshrubs or rarely shrubs glabrous or pubescent, adapted to greenhouse cult.: lvs. alternate, narrow, rarely obovate or spatulate, entire: fls. in dense spikes or globose or oblong heads, white, straw-colored or rose, hermaphrodite; perianth narrow or elongate, 5-parted, segms. equal, linear, rigid, usually plumose; stamens 5; ovary sessile or stipitate, glabrous or lanuginous, ovule 1: fr. an indehiscent utricle.—About 60 species, natives of Austral.

exaltatum, Benth. (*Ptilotus exaltatus*, Nees). A tender perennial, 2-3 ft. high, erect, usually branching above: lower lvs. 2-5 in. long, oblong-lanceolate, rather thick, contracted into a long petiole; upper lvs. smaller: spikes erect, long-peduncled, at first ovoid-conical, becoming longer: perianth $\frac{3}{4}$ in. or less long, yellowish, with dull red tips. B.R. 25:28 (as *T. alopecuroidum*).—Intro. in this country as a greenhouse subject.

T. Manglesii, Lindl., is perhaps the choicest species. It has violet-purple fls. in large pyramidal heads 3 in. long and 2 in. wide at base. It could probably be grown as a summer annual. B.M. 5448. F.S. 23:2396. R.H. 1866:291. F. 1864:217. I.H. 13:464. G.C. 1864:555; III. 32:181. G. 25:20. Gn. 68, p. 225.

F. W. BARCLAY.

TRICHLÔRIS (Greek, for *three*, and *Chloris*, a genus of grasses, referring to the 3 awns which differentiate the two genera). *Gramineæ*. Perennial grasses that resemble *Chloris* but differ in having 3-awned lemmas. Species 5, Mex. and S. S. Amer.

mendocina, Kurtz. (*T. Blanchardiàna*, Hack.). Spikes several, erect, slender, approximate at top of the culms, feathery with the delicate awns. Argentina.—An ornamental grass, readily grown from seed.

A. S. HITCHCOCK.

TRICHOCAÛLON (Greek, *hair and stem*; said to allude to the bristles that tip each tubercle on the st.). *Asclepiadaceæ*. Perennial herbs, suitable probably for the warmhouse. Sts. low, thick, fleshy, many-angled, angles tuberculate; tubercles aculeate: fls. small, between the angles, usually solitary, very short-pedicelled; calyx 5-parted, segms. acute; corolla disk-shaped, deeply 5-cleft, lobes broadly ovate; disk double, short-stipitate, outer deeply 5-lobed, inner 5 ligulate lobes.—About 15 species, Trop. and S. Afr. *T. pictum*, N. E. Br. St. subglobose or cylindrical, oblong, very obtuse, 2-3 by about 2 in., irregularly tessellate-tuberculate, glabrous: fls. fascicled, erect, fascicles 2-4-fl'd.; sepals broad ovate; corolla not $\frac{1}{2}$ in. diam., white marked with purple spots and numerous short lines, lobes broad deltoid-ovate, acute. S. Afr. B.M. 8579. *T. Pillàusii*, N. E. Br. Plant 5-9 in. high, branching at base: sts. $1\frac{1}{4}$ - $2\frac{1}{4}$ in. diam., cylindrical, with many tuberculate angles, glaucous-green, glabrous, tubercles ending in stiff bristles: fls. in small clusters, between the angles, toward the top of the sts.; sepals ovate, very acuminate; corolla bright creamy yellow, glabrous and smooth outside, densely papillate on the inner face of lobes. S. Afr. Var. *major*, N. E. Br. Plant and fls. larger than the type. S. Afr.

F. TRACY HUBBARD.

TRICHOCÉNTRUM (Greek, *hair and spur*, alluding to the long slender spur). *Orchidaceæ*. A small group allied to *Rodriguezia* (*Burlingtonia*); the plants grow in dense matted tufts.

Pseudobulbs very small, each bearing a broad fleshy

fl.: infl. a few-fl'd. raceme on which usually only 1 fl. opens at a time: sepals and petals free, spreading; labellum larger, spurred, with 2 lateral lobes and a 2-parted middle lobe; column short; pollinia 2, on a wedge-shaped stipe.—About 20 species. Epiphytes of dwarf stature, growing best on blocks; free-flowering; they suffer from too much water at the root; give them a warmhouse temperature. Prop. by division.

álbo-purpúreum, Reichb. f. Lvs. oblong-lanceolate, 3 in. long, tufted: fls. on short peduncles, 2 in. across; sepals and petals obovate-lanceolate, inside maroon-brown, with greenish tips, outside greenish; labellum subquadrate, white, with a large purple spot on each of the lateral lobes. Brazil. B.M. 5688. A.F. 6:609. J.H. III. 51:382.

tigrinum, Lindl. & Reichb. f. Similar in habit to the preceding: lvs. oblong, obtuse, speckled with red: fls. pendulous, nearly 3 in. across; sepals and petals broadly linear, yellow, speckled with red; labellum cuneate-obovate, emarginate, white, rose toward the disk. May. Cent. Amer. B.M. 7380. I.H. 24:282.

T. panamense, Rolfe. Fls. light green, with white lip, with red-purple blotch at base; spur yellowish, short, dilated, divided at apex into 4 short lobes. Panama.

HEINRICH HASSELBERG.

TRICHOGLÓTTIS (Greek, *hair* and *tongue*, referring to the fine hairs on the labellum). *Orchidaceæ*. Epiphytic herbs, occasionally grown in the warmhouse. Sts. leafy, elongated, not pseudobulbous: lvs. distichously arranged along the st., narrow: peduncles lateral, very short, 1- to few-fl'd.: fls. small or medium; sepals spreading, lateral very broad at the base, dorsal oblong; petals like the dorsal sepal; lip adnate with the column-foot, forming a long horizontal spur-like chin, spreading above, lateral lobes erect, short, midlobe rather broad, spreading; column short, wingless; pollinia 2, globose.—About 30 species, Malaya and the Philippines. *T. Solerederi*, Kränzl. Sts. elongated: lvs. fleshy, somewhat lanceolate, up to 5 in. long, about 1 in. wide:

racemes 1-fl'd.: sepals obovate-oblong, 4-5 lines long, bright green, each with 5 transverse brown-purple bands; petals much smaller, similar in color, but with only 3 bands; lip $\frac{1}{2}$ in. long, white, soon becoming yellowish with 2 blood-red spots on the disk. Philippines. *T. Dawsoniana*, Reichb. f. (*Cleisostoma Dawsoniana*, Reichb. f.). Scape 6-10 in. high, stout: lvs. 3-8 in. long, oblanceolate: fls. 2 in. diam., yellow-green barred with brown; sepals oblong-lanceolate; petals shorter; lip subsessile, side lobes oblong, midlobe ovate, acute, with a short falcate wing on each side of the tip. Burma.

F. TRACY HUBBARD.

TRICHOËNA (Greek for *hair* and *mantle*, referring to the covering of silky hairs on the spikelets). *Gramineæ*. Allied to *Panicum*: spikelets loosely paniculate, clothed with long silky hairs; first glume minute, remote from the second; second glume and sterile lemma

3836. *Tricholœna rosea*.

2-lobed, a slender awn from between the lobes.—Species 10, all African, 1 extending to the Medit. region and 2 to India.

rôsea, Nees (*T. violœcea*, Hort. *T. grandiflora*, Hochst. *Panicum tonsum*, Steud.). Fig. 3836. *NATAL-GRASS*. Annual: culms usually geniculate at base, $1\frac{1}{2}$ -3 ft. high: panicle 3-8 in. long, the silky spikelets a rich wine-color when fresh, changing to purplish when dry. S. Afr. R.H. 1897, p. 273.—One of our most beautiful ornamental grasses. Sometimes called ruby-grass. It has become naturalized in parts of Fla. and Calif. A. S. HITCHCOCK.

3837. Fructification of *Trichomanes*. (Enlarged.)

TRICHÓLEPIS (Greek, *hair* and *scale*, the involucre scales are narrow with long hair-like tips). *Compositæ*. Annual or perennial herbs, which are branched and unarmed: lvs. alternate, entire, toothed or the lower pinnatifid: heads terminal, solitary, homogamous; involucre ovoid or broader; bracts many-rowed, very narrow, usually with long recurved hair-points: fls. all hermaphrodite, similar and fertile, yellow, red, or purple; tube slender; limb 5-cleft: achenes glabrous, oblong or obovoid, ribbed.—About 7 species, India.

furcata, DC. Glabrous or puberulous herb, $1\frac{1}{2}$ -6 ft. high, branched from the base: lvs. 2-6 x $\frac{3}{4}$ -2 $\frac{1}{2}$ in., elliptic-lanceolate, acute or acuminate, denticulate, short-petioled: head rather large, yellow; involucre bracts needle-like. Himalaya. Grown for ornament.

TRICHÓMANES (Greek, *soft hair*). *Hymenophyllaceæ*. A group of filmy ferns distinguished by its tubular cup-like indusium and filiform elongate receptacle. (Fig. 3837.) Very delicate in texture and capable of being grown successfully only under shaded glass. Over 100 species are known. Various species may be found in the collections of fanciers, but the following appear to be the only ones regularly in the American trade. For culture, see *Ferns*.

radicans, Swartz. Lvs. 2-8 in. long, 1-1 $\frac{1}{2}$ in. wide, bipinnatifid; pinnae ovate, obtuse; indusia terminal, on short lobes. Tropical regions, extending into the southern states as far as Ky.

Priëtrii, Kunze (*T. inaepris*, Hook.). Lvs. 12-18 in. long, 6-12 in. wide, tri-quadrupinnatifid; pinnae ovate-lanceolate; sori 2-12 to a pinnule, small, in sinuses; indusium with a much dilated lip. Trop. Amer.

L. M. UNDERWOOD.

TRICHONÈMA: *Romulea*.

TRICHOPÏLIA (Greek, *hair* and *cap*; the anther is concealed under a cap surmounted by three tufts of hair). *Orchidaceæ*. Handsome orchids, usually grown in pots, although epiphytal.

Pseudobulbs crowded on the short rhizome, flattened and often elongate, 1-lyd., surrounded with dry scales at the base: lvs. large, solitary, erect, fleshy, keeled: fls. abundantly produced on short, nodding or decumbent scapes; sepals and petals narrow, spreading, often twisted; labellum large, forming the most conspicuous part of the fl., united with the column below, lateral lobes convolute, middle lobe spreading; anther bent over; pollinia on a triangular caudicle; clinandrium fimbriately winged.—About 20 species, ranging from Mex. to S. Amer. The fls. keep fresh a long time, both on the plant and when cut. They need an intermediate or greenhouse temperature. If grown too warm, they suffer. Prop. by division.

Galeottiana, A. Rich. & Gal. Pseudobulbs narrow, flattened, 5 in. long: lvs. oblong, acute, about 6 in. long: scapes short, mostly 1-fld.: sepals and petals cuneate-lanceolate, yellowish green, sometimes with a band of cinnamon down the middle; labellum trumpet-shaped, whitish with some purple streaks and dots in the center, and yellow in the throat. Aug., Sept. Costa Rica, Mex. I.H. 6:225 (as *T. picta*). B.M. 5550 (as *T. Turilux*). C.O. 5.

fragrans, Reichb. f. (*Pikimna fragrans*, Lindl. *T. Backhousiana*, Reichb. f.). Pseudobulbs clustered, flattened, 3-5 in. long, 1-lvd.: lvs. oblong-lanceolate, acute, 6-8 in. long: scape pendent, 1 ft. long, about 6-fld.: fls. on pedicels 3 in. long; sepals and petals spreading, linear-lanceolate, $2\frac{1}{2}$ -3 in. long, wavy and twisted, greenish white; labellum folded over the column, spreading in front, and somewhat lobed, white with a yellow stain in the throat. Summer. Colombia. B.M. 5035. C.O. 3. G. 35:411. G.M. 52:421.—Fls. almond-scented.

nobilis, Reichb. f. (*Pikimna nobilis*, Reichb. f. *T. candida*, Lindl.). Pseudobulbs large: lvs. broadly oblong-acute: fls. white; sepals and petals linear-oblong, acute, 2 in. long, scarcely twisted; labellum large, white with a yellow spot in the throat. Venezuela. I.H. 19:94 (as *T. fragrans* var. *nobilis*). F.M. 1872:21 (as *T. fragrans*).—This has larger stouter pseudobulbs and shorter broader lvs. than *T. fragrans*. The labellum is larger and the petals shorter compared with the size of the fl. Var. *alba*, Hort., has fls. pure white.

tortilis, Lindl. Pseudobulbs oblong, compressed, somewhat curved, 2-4 in. long: lvs. solitary, oblong, acute, 6 in. long: fls. solitary, on decumbent stalks shorter than the lvs.; sepals and petals linear-lanceolate, 2 in. long, spirally twisted, brown with yellowish margins; labellum forming a tube around the column, upper portion expanded, 4-lobed, white with crimson spots, becoming entirely crimson within. Fls. profusely in summer and sometimes again in winter. Mex. B.M. 3739. B.R. 1863. F.C. 3:101. B. 3:122. C.O. 6. Var. *alba*, Hort., is advertised.

suavis, Lindl. Fig. 3838. Pseudobulbs thin, compressed, 2 in. long: lvs. broadly oblong, 8 in. long: scape pendent, about 3-fld.: fls. on long, curved stalks, large; sepals and petals lanceolate-acuminate, wavy, nearly straight, 2 in. long, white or cream-colored; labellum large, projecting forward, white or cream-colored, spotted with pale purple, yellow in the throat; limb large-lobed, wavy, and crenate. May, June. Cent. Amer. B.M. 4654. F.S. 8:761. R.H. 1859, pp. 220, 221; 1887, p. 454. Gn. 4, p. 511; 31, p. 452; 38, p. 185; 48, p. 79; 51, p. 371. C.O. 4. R.B. 23:256. G.M. 38:281. A.G. 24:331. J.F. 3:277. J.H. III. 43:371. Var. *alba*, Warner. Fls. white with a yellow spot in the throat of the labellum. C.O. 4a. G. 16:686. G.W. 14, p. 52. Var. *grandiflora*, Hort. A large-fld. form. G.W. 5, p. 344. Var. *candida*, Hort. Fls. pure white except yellow blotch at base of lip.

marginata, Henfr. (*T. coccinea*, Warse. *T. crispa* var. *marginata*, Hort.). Pseudobulbs clustered, oblong, compressed: lvs. broadly lanceolate, suddenly acuminate, subauriculate at the base: scape about 3-fld.: fls. large, whitish outside, reddish purple within; sepals and petals linear-lanceolate, margined with white, the former slightly twisted; labellum trumpet-shaped, with a large, rounded, wavy, 4-lobed blade. May, June. Cent. Amer. B.M. 4857. F.S. 14:1490; 18:1925-26. G.C. III. 20:456. F.M. 1874:98 (as *T. lepidota*). J.F. 2:184. C.O. 2.

crispa, Lindl. This plant was described by Lindley in Linden's catalogue. It is closely related to *T. marginata*, which is sometimes classed as a variety of *T. crispa*. The following description is taken from Watson's Orchids: Pseudobulbs ovate, flattened, 2-3 in.

long, dark green, 1-lvd.: lvs. leathery, 6 x 2 in., keeled, acute-pointed: fl.-spikes basal, drooping, short, 3-fld.: fls. with pedicels 2 in. long; sepals and petals spreading. $2\frac{1}{2}$ in. long, $\frac{1}{2}$ in. wide, wavy-edged, twisted, brownish yellow; lip folded over the column, spreading in front, $1\frac{1}{2}$ in. across, colored deep crimson with a white margin. May, June. Costa Rica. C.O. 2.

T. Gouldii—*T. suavis* x *T. fragrans*.—*T. Hennisiana*, Kränzl. Fls. very fragrant, pure white, with 2 zones of golden yellow on lip. Colombia.

HEINRICH HASSELBRING.

TRICHÓPTERIS (from Greek for *hair*, and *Pteris*). *Cyatheaceae*. A generic name applied to several American species of *Alsophila* which, however, probably do not deserve separation. *T. Albertii*, Hort., said to come from the Congo, is not botanically known.

R. C. BENEDICT.

TRICHOSÁNTHES (Greek, *hair* and *flower*, alluding to the fringed edge of the petals). *Cucurbitaceae*. SNAKE GOURD. Climbing herbs, annual or perennial, sometimes shrubby at base, roots sometimes tuberous, grown both in the greenhouse and outdoors as tender annuals.

Leaves entire or 3-5-lobed, base cordate; tendrils simple or 2-3-cleft: fls. rather large or small, white, monoecious; male fls. racemose, calyx-tube oblong or

3838. *Trichopilia suavis*. (x1/4)

cylindrical, dilated above, 5-lobed, corolla rotate, 5-parted; stamens 3, ovary rudimentary; female fls., calyx and corolla as in male, stamens rudimentary or none; ovary oblong or globose: fr. usually large, fleshy, globose, oblong, ovoid-fusiform, or conical.—About 50 species, Trop. Asia, N. Austral. and Polynesia. Monographed in DC. Monogr. Phaner. 3:351. The fr. is often ornamental and highly colored; in *T. Anguina* it has been noted over 6 ft. in length. The plants flower in July from seed sown in March. They may be treated as tender annuals.

A. Bracts small or none on the racemes of male fls.

B. Fr. ovoid.

cucumeroides, Maxim. Root fleshy, tuberous: st. slender, 12-15 ft.: lvs. ovate in outline, 4-6 in. long, more or less palmately 3-5-lobed, margin crenulate: peduncle bearing the male fls. 1-4 in. long and 3-15-fld.:

petals about $\frac{1}{2}$ in. long, oblong, acute, longly fringed: fr. oblong, shortly rostrate, nearly 3 in. long, vermilion-colored. Japan.—Offered by importers of Japanese plants.

BB. Fr. oblong.

Anguina, Linn. (*T. colubrina*, Jacq.). SERPENT or SNAKE GOURD. Fig. 3839. St. slender, tall-growing: lvs. nearly circular in outline, 5-7 in. across, 3-7-lobed; lobes round; margin undulate or wavy: peduncle bearing the male fls. 4-10 in. long, 8-15-fld.: body of petals oblong, less than $\frac{1}{2}$ in. long, fringes $\frac{1}{2}$ in. long: fr. slender, contorted, often exceeding 3 ft. in length. India, but widely planted. B.M. 722. B.R. 32:18. R.H. 1859, p. 595.

AA. Bracts large on the male raceme.

B. Calyx-segms. entire.

c. Lvs. lobed.

Kirilôwii, Maxim. (*Eopèpon vitifolius*, Naud.). Perennial root tuber-like: st. annual, high-climbing, 20-30 ft.: lvs. nearly circular in outline, 3-8 in. across, deeply 5-7-lobed, the lobes oblong, acute, coarsely serrate: racemes bearing the male fls. 4-8 in. long, 3-8, rarely only 1-fld.: petals triangular-wedge-shaped, deeply cut and the segms. much cut and longly fimbriate, ovoid, somewhat acute; base shortly attenuate, yellowish orange, about 4 in. long, $2\frac{1}{2}$ in. thick. Mongolia.

cc. Lvs. not lobed.

cordata, Roxbg. (*T. palmata*, Wall.). Root tuberous: st. robust, high-climbing: lvs. wide, ovate-cordate, acute or shortly acuminate, 5-8 in. long, rarely somewhat angled or obscurely lobed; margin slightly dentate: peduncle bearing male fls. 5-8 in. long, 4-8-fld.: calyx-segms. finely acute: fr. globose, red, orange-streaked, not acute at the apex. India.

BB. Calyx-segms. toothed.

bracteata, Voigt (*T. palmata*, Roxbg.). St. stout, climbing to 30 ft.: lvs. broadly ovate, scabrous above, usually deeply 3-7-lobed; lobes acute; margin dentate: peduncle of male fls. 4-8 in. long, 5-10-fld.: fr. globose, red with orange stripes about 2 in. long. India.

F. W. BARCLAY. F. TRACY HUBBARD.†

TRICHÔSMA (Greek, *three and ridge*, referring to the 3-lobed labellum). *Orchidaceæ*. A genus of 1 species resembling *Cœlogyne*. Sepals and petals similar, erect-spreading, the lateral pair forming a distinct mentum with the projecting foot of the column; labellum 3-lobed, the lateral lobes erect, convolute over the column, middle lobe with longitudinal ridges: sts. slender, 2-lvd.: infl. racemose. *T. albo-marginata* of the trade is unidentified.

suavis, Lindl. (*Èria coronaria*, Reichb. f.). Lvs. lanceolate, undulate, 3-nerved: fls. few in a terminal raceme, white, yellowish or purplish, fragrant; sepals ovate-lanceolate; petals oblong; labellum ovate-oblong, streaked with purple; disk yellow, middle lobe with several crenate ridges. Himalaya. B.R. 28:21.

HEINRICH HASSELBRING.

3839. *Trichosanthes Anguina*. (X $\frac{1}{2}$)

TRICHÔSPORUM (Greek, *hair and seed*; seeds with 1 or more long hairs at the ends). Syn., *Æschynanthus*. *Gesneriaceæ*. Subshrubs or shrubs, often climbing over trees, glabrous or rather villous, grown in the warmhouse.

Lvs. opposite, fleshy or leathery: fls. showy, scarlet, greenish or yellow and green mixed, fasciated in the axils or at the ends of the branches, rarely solitary; calyx truncate, 5-cleft or 5-parted; corolla-tube elongated, ventricose or broadened above; limb somewhat 2-lipped, usually strongly oblique; perfect stamens 4; disk annular, usually thick, cup-shaped; ovary superior, oblong or linear: caps. long-linear, 2-valved.—About 55 species, India, Malaya, and E. Trop. Asia.

These beautiful free-flowering plants are propagated by cutting the branches that have been made during the season of growth into lengths of about 2 inches, having two leaves attached and another joint to insert in the sand. They root in about a month in a close frame when the temperature top and bottom is maintained around 70°. Being epiphytal under natural conditions, these plants like a loose open material to grow in, and equal parts of osmunda fiber and sphagnum moss to which plenty of broken charcoal has been added are the best potting material. Shallow pans are best to grow them in, and provision should be made for the water to pass freely through them. The plants should not be allowed to flower the first season, the aim being to secure a good foundation for a future plant, and this is done by pinching the shoots three or four times during the season, growing them in a night temperature of 65°. In winter they may be kept 5° cooler and given enough water to prevent shriveling. The plants should not be stopped the second season, but allowed to run to flower; but after they have finished flowering they may be pruned back to within 6 inches of the base of the plant. Trichosporums should be grown hung from the roof of the house, near the glass, and when the sun gets strong they should have a light shade. When well rooted in the pan they are growing in, manure-water should be given. These plants are not subject to insect pests. (George F. Stewart.)

A. Calyx deeply 5-parted, the lobes acute.

grandiflorum, D. Don (*Æschynanthus grandiflora*, Spreng.). St. creeping, mostly herbaceous, 4-5 ft.: lvs. lanceolate, acuminate, 4-5 in. long, repand-serrate, fleshy: fls. aggregated; calyx fleshy and short; corolla arched-tubular, 2-3 in. long, downy, orange-scarlet. E. India. B.M. 3843. P.M. 5:241.—Will succeed in an intermediate house.

AA. Calyx tubular, entire or shortly 5-toothed.

pulchrum, Blume (*Æschynanthus pulchra*, Don. *Æ. pulcher*, DC.). Fig. 3840. Trailing: lvs. broadly ovate, distantly small-toothed: corolla glabrous, brilliant scarlet, 3 times longer than the glabrous greenish calyx. Java. B.M. 4264. R.B. 18:13. R.H. 1883:204. P.M. 16:161.

Lobbianum, Kuntze (*Æschynanthus Lobbiana*, Hook.). The commonest species in cult. in this country: differs from *T. pulchrum* in narrower and nearly entire lvs., corolla downy and projecting only twice or less the length of the purple downy

3840. *Trichosporum pulchrum*.

calyx. Java. B.M. 4260, 4261.—A very attractive plant when well grown.

T. Boschianum, Kuntze (*Æschynanthus Boschiana*, De Vr. *Æ. Lamponga*, Miq.). Lvs. ovate or elliptic, obtusish, entire; calyx cylindrical, glabrous; corolla twice as long (2 in.), pubescent, scarlet. Sumatra. P.M. 13:175.—*T. fulgens*, Kuntze (*Æschynanthus fulgens*, Wall.). Lvs. lanceolate; calyx tubular, short-toothed, glabrous; corolla about 2 in. long, orange-red, pubescent. E. Indies. B.M. 4891.—*T. javanicum*, Kuntze (*Æschynanthus javanica*, Hook.). Allied to *T. pulchrum*; differs in having a pubescent calyx and corolla. B.M. 4503. F.S. 6:558.—*T. longiflorum*, Kuntze (*Æschynanthus longiflora*, Blume). Vigorous; lvs. 3-5 in. long; calyx deeply cut, the divisions linear-subulate; corolla tubular, scarlet, very long; fls. fascicled. Java. B.M. 4328. P.M. 15:25.—*T. macrocalyx*, Kuntze (*Æschynanthus macrocalyx*, C. B. Clarke). Lvs. 4-5 in. long, fleshy, oblong, acuminate; fls. axillary, solitary; calyx $1\frac{1}{4}$ in. long, lobes narrowly lanceolate, acuminate; corolla cylindrical-funnel-shaped, scarlet with dark purple nerves and spots. Siam.—*T. marmoratum*, Kuntze (*Æschynanthus marmorata*, F. Moore. *Æ. zebрина*, Van Houtte). Lvs. $3\frac{1}{2}$ in. long, oblong-lanceolate, obovate-lanceolate or ovate, acuminate, reddish purple beneath; fls. axillary; corolla-tube green, curved, segms. ciliate, blotched with chocolate-brown. Habitat unknown.—*T. miniatum*, Kuntze (*Æschynanthus miniata*, Lindl.). Fls. vermilion, in 3's in the axils of the oval or elliptic entire lvs.; corolla pubescent. Java, Borneo. P.M. 16:65.—*T. speciosum*, Kuntze (*Æschynanthus speciosa*, Hook. *Æ. splendens*, Lindl. & Paxt.). Branches knotty; lvs. large, oval-lanceolate, nearly sessile, upper ones verticillate or in 3's; fls. fascicled, numerous; calyx with linear-subulate divisions; corolla large, orange-red, curved. Java. B.M. 4320. P.M. 14:199. Gn. 51:188.—*T. tricolor*, Kuntze (*Æschynanthus tricolor*, Hook.). Lvs. small, oval or lanceolate, hairy at the base; calyx obovate, pubescent; corolla small, pubescent, blood-red, throat orange, upper lobes striped black or purple; fls. mostly twin. Borneo. B.M. 5031. R.B.10:7. I.H. 5:169. F.S. 13:1384.

F. TRACY HUBBARD.†

TRICHOSTÈMA (Greek, *hair and stamen*, referring to the filaments). *Labiatae*. BLUE CURLS. Hardy or half-hardy herbs, adapted to the wild-garden or rockery.

Leaves entire; floral lvs. similar: floral whorls axillary, densely or laxly many-fld.; calyx campanulate, 10-nerved, 5-toothed; corolla-tube slender, usually exerted, without a ring inside; limb subequally 5-cleft, lobes oblong or broadly declinate; stamens 4, didynamous; ovary deeply 4-lobed; nutlets obovoid, reticulately rugose.—About 10 species, N. Amer.

dichotomum, Linn. BASTARD PENNYROYAL. Low, viscid annual; lvs. oblong or lanceolate-oblong, obtuse, short-petioled; corolla blue or pink, sometimes white. Sandy fields, Mass. to Ky., Fla., and Texas.

lanatum, Benth. A perennial shrubby plant with rosemary-like lvs. and cymes of fls. in a naked terminal thyrses: lvs. narrow-linear, 1-nerved, sessile, margins revolute; calyx and corolla covered with dense violet or purple wool; corolla $\frac{1}{2}$ in. long. S. Calif.—A very handsome shrub, known as "ramero."

Purpusii, Brandeg. Perennial, somewhat woody, much branched, 1- $1\frac{3}{4}$ ft. high; lvs. short-petioled, ovate, $\frac{3}{4}$ - $1\frac{1}{4}$ in. long, dark green; floral whorls axillary, few-fld., forming terminal loose leafy panicles: fls. showy, scarlet; corolla shortly hairy, about $\frac{1}{4}$ in. long, upper lip helmet-shaped, 3-lobed, lower lip pendulous. S. W. Mex.

F. TRACY HUBBARD.†

TRICHOSTÍGMA (named for the *hairy stigma*). *Phytolaccaceae*. Three Trop. American erect or scandent shrubs, as defined by Walter in Engler's *Das Pflanzenreich*, hft. 39 (IV. 83), 1909, of which *T. peruvianum*, Walt. (*Rivina peruviana*, Moq. *Villamilla peruviana*, Hook. f. *V. roseo-æmia*, Rusby. *Ledenbergia roseo-æmia*, Lem.), may be expected to appear in choice warmhouse collections. It is a climbing woody plant prized for its ornamental lvs., prop. by cuttings under glass: 6 ft. or more tall, with slender branches: lvs. elliptic, acuminate, usually rounded or cordate but unequal at base, thickish, shining metallic green above and rose-violet beneath; fls. small and whitish, in elongated lax partially erect but becoming drooping racemes. Andean region. I.H. 16:591, which represents a handsome purple plant, with a long raceme of phytolacca-like fls.

Trichostigma is characterized by alternate petiolate entire oval or elliptic lvs. and hermaphrodite racemose

small 4-parted fls.: sepals nearly equal, free, ovate or elliptic, reflexed in fr.; petals none; stamens 8-25, more or less inserted on the hypogynous disk; ovary 1-celled, the style very short or none: fr. berry-like, globular.

TRICUSPIDÀRIA (Greek, *three and points*; the petals are divided into 3 pointed lobes). Syn., *Tricuspis*. *Elæocarpaceae*. Trees grown in the greenhouse, hardy in the extreme South where they are used as ornamentals.

Leaves alternate or opposite, serrate; peduncles axillary, solitary, 1-fld.: fls. rather large; calyx campanulate, truncate, obsoletely 5-toothed, deciduous; petals 5, 3-dentate or -lobed; stamens numerous; ovary 3-5-celled, ovules many in a cell: caps. leathery, usually angled, loculicidally 3-5-valved.—Two species, Chile. The accepted name is now *Crinodendron*.

C. dependens, Schneid. (*Tricuspidaria dependens*, Ruiz & Pav.). Compact tree: lvs. broad oblong-obovate or obovate, apex rather blunt, crenulate-dentate: fls. white, campanulate, pedicels slender. Chile. B.M. 8115.—Intro. into Calif.

C. Patágua, Molina (*C. Hookerianum*, Gay. *Tricuspidaria dependens*, Hook., not Ruiz & Pav. *T. hexapétala*, Turcz. *T. lanceolata*, Miq.). Tree, up to 30 ft. high: lvs. elliptic or elliptic-lanceolate, apex acute, sharp-serrate: fls. red, hanging. Chile. B.M. 7160. G. 37:197. Gn. 70, p. 284. G.C. III. 47:75; 55, suppl. Jan. 10. G.M. 47:575. J.H. III. 61:61 (last four as *T. dependens*).

F. TRACY HUBBARD.

TRICÝRTIS (Greek, *three convexities*, referring to the nectar-bearing sacs at the base of the three outer perianth-segments). *Liliaceae*. TOAD-LILIES. Half-hardy perennials, pretty garden plants; also used for pot culture.

Rhizome short-creeping; sts. erect, simple below the infl., leafy: infl. terminal, or laxly dichotomous in the upper axils: fls. few, rather large, somewhat long-pedicelled; perianth usually beautifully spotted inside, campanulate, segms. distinct from the base, lanceolate, acute; stamens 6; ovary oblong, 3-cornered, 3-celled: caps. narrowly oblong, prominently 3-cornered, septicidally dehiscent, erect, usually more than 1 in. long.—About 9 species, native to Japan and Formosa. Monographed by J. G. Baker in *Journal Linnean Society*, vol. 17, p. 463 (1879).

A. Base of lvs. not clasping the st.

B. Plant not stoloniferous.

3841. *Tricyrtis hirta*. ($\times \frac{1}{4}$)

formosana, Baker. Sts. flexuous, about 1 ft. high: lvs. few, sessile, oblanceolate, acute, base cuneate, lower 4-5 in. long, $\frac{3}{4}$ -1 in. broad, both surfaces green: fls. few, in a lax corymb, whitish purple, scarcely spotted, about $\frac{1}{4}$ in. long; style as long as the stigmas. Formosa.

BB. *Plant stoloniferous.*

stolonifera, Matsum. Herbaceous, 2 ft. high, with a stoloniferous base: st. reddish purple below, greenish above, at first hairy, later glabrous: lvs. elliptic-lanceolate, acuminate, narrowed to a sheathing base, $8 \times 1\frac{3}{4}$ in., glabrous above, with dark blotches and sunken nerves: fls. purple, indistinctly blotched; perianth yellow at base, segms. elliptic, acute, 1 in. long, 2-lobately saccate at base. Formosa. B.M. 8560.

AA. *Base of lvs. clasping the st.*B. *St. pilose, with spreading hairs.*

hirta, Hook. (*T. japonica*, Miq.). Fig. 3841. St. 1-3 ft. high, everywhere clad with soft whitish spreading hairs: fls. 6-15, racemose or subcorymbose, whitish, the outer segms. covered with rather large purple spots. Widespread in the woods of Japan. B.M. 5355. Gn. 30, p. 431; 49:290. V. 12:204. Var. **nigra**, Hort. (*T. nigra*, Hort.), has black instead of purple spots. Gn. 49:290. A form with variegated lvs. was once offered in this country.

BB. *St. not prominently hairy, puberulent or very slightly pilose.*

C. *Fls. yellow, unspotted.*

flava, Maxim. St. dwarf: lvs. oblong-lanceolate: fls. racemose, yellow, not spotted. Seen by Maximowicz in the gardens of Yedo only.

CC. *Fls. spotted, not yellow.*D. *Spots rather large.*

pilosa, Wall. St. 2-4 ft. high, very slightly pilose: lvs. oblong: fls. numerous, loosely corymbose, whitish, with large purple spots; style half as long as the stigmas. Himalayas, 5,000-6,000 ft. B.M. 4955 (perianth-segms. narrow, oblong). F.S. 12:1219.

DD. *Spots minute.*E. *Style as long as the stigmas.*

latifolia, Maxim. St. glabrous, flexuous, 2-3 ft. high: lvs. broadly oblong or the uppermost ovate: fls. few in a terminal corymb, whitish, with minute purple spots; style as long as the stigmas. Japan.

EE. *Style half as long as the stigmas.*

macropoda, Miquel. St. 2-3 ft. high, puberulous above: lvs. oblong: fls. in a loose corymb, whitish purple, with minute purple spots; style half as long as the stigmas. Blooms in June and July, according to J. B. Keller. Japan, China. B.M. 6544 (segms. broadly ovate, decidedly yellow, spotted red and veined red near tips).—In F. S. 18:1820 is figured a plant with sessile lvs. striated with white, and no fls., which he refers to *T. macropoda*. This was sent out by Van Houtte as *T. hirsuta*, but it is a glabrous plant and probably lost to cult. Var. **striata**, Hort., is offered in the trade as a form with variegated green-and-white lvs.

T. grandiflora, Hort., should be compared with *T. hirta* var. *nigra*. It is a name scarcely known to botany. It is said to have orchid-like fragrant fls. in Oct. and Nov. (Baker says the genus has no fragrant fls.). Dutch growers say that *T. grandiflora* has white fls. mottled with black.

WILHELM MILLER.

F. TRACY HUBBARD.†

TRIDAX (an old Greek name used by Dioscorides, meaning *summer eating*, alluding to a plant that was a summer vegetable). *Compositæ*. Hardy perennial herbs, possessing little beauty. Plants branched, hirsute or glabrescent: lvs. opposite, incise-dentate or pinnately cut, segms. few and narrow: heads medium-sized, long-peduncled, heterogamous: ray-fls. yellow, male disk-fls. greenish, fertile; involucre ovoid, campanulate or rather hemispherical; bracts few-rowed, slightly unequal: achenes turbinate.—About 27 species, Trop. Amer.; one species also occurs in India and Mauritius. Two species have been cult. occasionally. *T. coronopifolia*, Hemsl. About 1 ft. high: lvs. variously pinnatifid or trifid, lobes linear: fls. yellow, rays 5-lobed. Mex. *T. trilobata*, Hemsl. (*Galinsoga trilobata*, Cav.). About 1 ft. high: lvs. 3-lobed or pinnately incised: fls. yellow; rays 5-toothed. Mex.

T. gaillardioides, Hook. & Arn. = *Layia gaillardioides*. F.S.R. 2:72.

TRIENTALIS (Latin for the third of a foot; referring to the height of the plant). *Primulaceæ*. STAR-FLLOWER. CHICKWEED-WINTERGREEN. Very glabrous small perennials sometimes grown in wild borders.

Rhizomes slender, creeping: st. solitary, slender, erect: lvs. usually the same number as the petals, somewhat whorled, obovate-elliptical or lanceolate, very entire: peduncles 1-3-fld., filiform, without bracts: fls. white; calyx 5-9-parted, segms. linear-lanceolate, persistent; corolla rotate, 5-9-parted; tube very short, segms. elliptic-lanceolate, very entire; stamens 5-9; ovary free, globose: caps. globose, 5-valved, many-seeded.—Two species, one in Eu., the other in N. Amer.

A. *Lvs. acuminate at both ends.*

americana, Pursh. St. naked below, 3-8 in. high, 5-9-lvd. at the summit: lvs. lanceolate: divisions of the white corolla finely acuminate. Damp woods, Lab. to Va.

AA. *Lvs. obtuse (acute in var. latifolia).*

europæa, Linn. St. either naked or with a few scattered lvs. below the cluster of obovate or lanceolate oblong, obtuse or abruptly somewhat pointed lvs.: divisions of the white or pink corolla abruptly acuminate or mucronate. Alaska, Eu., and Asia. Var. **arctica**, Ledeb. Dwarf: lvs. 1 in. long, decreasing below: corolla white. Var. **latifolia**, Torr. St. naked below the cluster of 4-7 oblong-obovate, or oval, mostly acute lvs.: corolla white to rose-red. Woods, W. Calif. to Vancouver's Isl. By Pax & Knuth in Engler's *Das Pflanzenreich*, hft. 22, this plant is kept separate as *T. latifolia*, Hook., making 3 species in the genus.

F. W. BARCLAY.

TRIFOLIUM (name refers to the three leaflets). *Leguminosæ*. CLOVER. Low annual and perennial herbs, useful for cover-crops, soil-enrichment, and also in lawn-seed mixtures.

Leaves digitately 3-, rarely 5-7-foliate; stipules adnate to the base of the petiole: fls. usually purplish, red or white, rarely yellow, in spikes, heads, or umbels, or rarely solitary; calyx-teeth or lobes about equal or the lower longer, the 2 upper sometimes more or less connate; petals usually withering rather than falling off, more or less adnate to the base of the stamens; stamens 9 and 1; ovary small, ripening into a few-seeded, mostly indehiscent pod.—Between 200 and 300 species, most abundant in the N. Temp. zone.

The clovers are very important agricultural plants, but they have little distinctly horticultural value except as cover-crops and green-manures. See *Clover*, page 805, Vol. II. For the rôle of clovers as nitrogen-fixers, see *Legumes*, page 1834, Vol. IV. The species described

3842. *Trifolium repens*.—The white clover. ($\times \frac{1}{4}$)

here are offered mostly as forage plants. Many clovers are perennial, although they are of relatively short life, so that frequent resowing is necessary if plants are to be kept in robust condition. Some of the species are annual, and these tend to become weeds. All are propagated readily by means of seeds; but as the seeds are small and oily, they may not germinate well in dry hot soils. Three annual yellow-flowered species are weeds in some parts, particularly in the East, where they have been introduced from Europe: *T. agrarium*, Linn., yellow or hop-clover, with oblong-obovate sessile leaflets; *T. procumbens*, Linn., low hop-clover, more spreading, leaflets obovate and the terminal one stalked; *T. dubium*, Sibth., with leaflets truncate or emarginate at apex and the terminal one stalked. A silky-pubescent white-flowered annual species from Europe, *T. arvense* Linn., is the rabbit-foot clover of fields and waste places. *T. odoratum* of seedsmen is evidently *Melilotus*. Allied genera are *Lespedeza*, *Medicago*, and *Melilotus*.

A. Fls. in a long spike.

incarnatum, Linn. CRIMSON or SCARLET CLOVER. Fig. 1003, Vol. II. Annual, erect, 1-3 ft. high, soft-hairy: lvs. long-stalked, the lfts. broadly obovate and denticulate and sessile or nearly so by a cuneate base, the stipules large and thin and veiny and somewhat toothed: heads becoming 2-3 in. long, very dense: fls. sessile, bright crimson and showy, the calyx sharp-toothed and hairy. S. Eu. B.M. 328.—An escape in some places. Now much used as a cover-crop in orchards. See *Cover-Crops*. It is very showy when in bloom. If seeds are sown at midsummer or later, the plants may be expected to survive the winter and bloom early in spring.

rubens, Linn. Perennial, 20 in. or less tall, in clumps, the sts. erect: lvs. short-stalked, the lfts. oblong-lanceolate and strongly denticulate, the stipules long-lanceolate: heads usually in pairs, becoming 3-4 in. long: fls. purplish red, showy. Eu.—Attractive ornamental species. The heads become silky after flowering. There is a white-fl. form.

AA. Fls. in globular or ovate heads.

B. Corolla yellow.

filiforme, Linn. YELLOW SUCKLING CLOVER. Annual, of diffuse growth: lfts. obovate or orbiculate, somewhat denticulate, the terminal one stalked, the stipules broadly ovate: peduncles long and filiform, bearing sessile yellow fls. in umbel-like heads, the calyx-lobes unequal. Eu.—Sometimes used for forage or grazing, but little known in this country.

BB. Corolla white or ochroleucous (yellowish white).

alexandrinum, Linn. EGYPTIAN CLOVER. BERSEEM. Annual, with appressed hairs, the sts. tall, erect or ascending and branching: lvs. numerous, the lfts. oblong or lanceolate and somewhat denticulate, the stipules lanceolate-subulate and partly free from the petiole: head stalked or sessile, ovate, becoming oblong-conic in fr.: fls. ochroleucous. Egypt, Syria.

pannonicum, Jacq. HUNGARIAN CLOVER. Perennial, very hairy, the sts. usually simple, 2 ft.: lfts. lance-oblong and subacute to retuse, ciliate and entire, the stipules narrow and longer than the short petioles: heads ovate-oblong, stalked: fls. pale yellowish white or creamy yellow. Eu., Asia.—Handsome plant for the border; also recommended for forage.

repens, Linn. WHITE CLOVER. Fig. 3842. Low creeping glabrous perennial: lvs. long-stalked, the lfts. orbiculate and obscurely toothed, the stipules small and scale-like: heads long-peduncled from the ground, small and loose: fls. white, fragrant. Eu. and thought to be native in the northern part of the U. S. and in Canada, but naturalized everywhere.—Much used in lawns, and in some parts prized for pasture. There are

forms with red and purplish foliage. This is considered by most authorities to be the shamrock of Ireland. A form of it is offered as *T. minus*, "the genuine Irish shamrock." See *Shamrock*. Var. **atropurpureum**, Hort., is a dwarf form: lvs. bronze, edged with bright green. Var. **pentaphyllum**, Hort., is a creeping rock-plant: lvs. have a bronze luster. Var. **purpureum**, Hort., has fine bronzy purple foliage. The species assumes many forms.

BBB. Corolla rose-tinted or red.

C. Individual fls. pedicelled.

hybridum, Linn. ALSIKE or SWEDISH CLOVER. Ascending or nearly erect, 1-3 ft. high, branching, glabrous: lvs. long-stalked, the lfts. obovate and serrulate,

3843. Day and night positions of red clover leaf; unfolding young leaf at the right.

stipules ovate-lanceolate and thin: heads small and loose, nearly globular, long-stalked: fls. rose-colored or sometimes white on the top of the head. Eu. B.M. 3702.—A good forage plant; also naturalized. Thrives best on moist lands. Very hardy. Perennial.

CC. Individual fls. sessile.

D. Plant perennial.

pratense, Linn. (*T. pratense perenna*, Hort.). COMMON RED CLOVER. PEA-VINE CLOVER. COW-GRASS. Fig. 3843. Ascending and somewhat hairy, 1-1½ ft.: lvs. long-stalked, the lfts. oval or obovate and sometimes notched at the end and the blade marked with a large spot, the stipules broad but with a bristle point: heads globular, ovate, sessile: fls. red-purple. Eu., but everywhere intro., and much grown for pasture hay and green-manuring.

medium, Linn. MAMMOTH or ZIGZAG CLOVER. Stoutest and less erect: lfts. oblong and entire and without spots: heads usually stalked, and fls. rather deeper colored. Eu., and intro., and much grown by farmers for hay and forage.

DD. Plant annual.

resupinatum, Linn. (*T. suaveolens*, Willd.). Annual, diffuse or trailing glabrous plant: lfts. obovate and serrulate and as long as the petiole, the stipules lanceolate-acuminate: heads globose, with rudimentary involucre: fls. purple. Greece, Egypt to Persia.—Grown for ornament.

L. H. B.

TRIGLOCHIN (Greek, referring to the 3-pointed fruit of some of the species). *Alismaceæ*; or by Buchenau in Engler's *Das Pflanzenreich*, lft. 16 (IV. 14), 1903, placed in the *Scheuchzeriaceæ*. Thirteen species of linear-lvd. marsh plants of little value to the cultivator, although 1 species is listed abroad for planting in bogs or wet places. Perennial, erect: lvs. rush-like, more or less fleshy, sheathing at base: fls. small, spicate-racemose, on a long jointless naked scape, greenish; perianth of 3-6 parts; stamens 3-6; ovaries 3-6, united. *T. maritima*, Linn., the species mentioned, is widely distributed in the northern hemisphere along seashores and also in interiors: scape to 2½ ft. tall: lvs. thick: fr. ovoid or prismatic, pedicelled, in a long open racemose spike. The plant has a grass-like appearance and inconspicuous bloom.

TRIGONÉLLA (Latin, *a little triangle*; probably referring to the shape of the fls.). *Leguminosæ*. Annual or perennial herbs, usually strong-smelling: lvs. pinnately 3-foliate; lfts. with the veins often running out into teeth; stipules adnate to the petiole: fls. yellow, blue, or white, solitary, capitate, somewhat umbellate or shortly and densely racemose, sessile or peduncled at the axils; calyx tubular; petals free from the stamens, standard obovate or oblong; wings oblong, keel shorter than the wings, obtuse; stamens 9 and 1; ovary sessile or short-stipitate, many-ovuled: pod sometimes thick and long-beaked, sometimes linear, compressed or terete.—About 58 species, 1 from Austral., the others from Eu., Asia, and extra-Trop. Afr.

Fœnum-Græcum, Linn. **FENUGREEK**, which see. White-fl'd. annual, 1–2 ft. high, blooming in June and Aug. Distinguished from other species in its section by the erect unbranched st. and obovate lfts., which are obscurely dentate; stipules lanceolate-falcate, entire: calyx pilose: pods falcate, twice as long as the beak. Eu., Orient.

F. TRACY HUBBARD.†

TRIGONIDIUM (Greek, *three and small angle*, alluding to the triangular form of several parts of the plant). *Orchidaceæ*. Epiphytic herbs, grown in the warmhouse.

Stems very short, soon thickened into fleshy 1–2-lvd. pseudobulbs: lvs. leathery, not folded, linear or oblong: scape from below the pseudobulb or from a simple rhizome, many-sheathed, 1-fl'd.: fls. rather large, short-pedicelled, between spathe-like bracts; sepals about equal, connivent or coherent into a 3-angled tube at base; petals much smaller than sepals; lip erect, lateral lobes clasping the column, midlobe spreading, fleshy or callous at base; column without wings and footless; pollinia 4.—About 10 species, Trop. Cent. and S. Amer.

spatulatum, Lind. & Reichb. f. Pseudobulb ovate, 2-edged: lf. broadly ligulate, 8 in. long: fl. terminal; dorsal sepal ovate from a ligulate base, acute, lateral sepals oblong-lanceolate, acute, all yellowish purple; petals lanceolate, with a fleshy disk below the apex; lip narrow, angulately 3-lobed, midlobe transversely semi-ovate, rather acute. Colombia.

subrèpens, Rolfe. Rhizome subrepent, stout: pseudobulbs rather distant, oblong, somewhat compressed, obscurely 3-ribbed, about 1 in. long, 1-lvd.: lf. ligulate, rather obtuse, 6–7 by about $\frac{1}{2}$ in., rather leathery: scape 6–7 in. high, with numerous lanceolate sheaths; dorsal sepal rhomboid-oblancoate, about 1 in. long, lateral suboblique, broad-elliptic, all greenish yellow; petals whitish with 3 brown lines, narrowly elliptic-oblong; lip greenish yellow, with brown radiating veins on the side lobes, 3-lobed, short, midlobe oblong. Habitat unknown.

The following species are sometimes found in cult.: *T. acuminatum*, Batem. Pseudobulbs ovate, acute, sulcate: lf. linear: fl. dull straw-color, penciled with rich brown inside; sepals acuminate recurved at apex; petals oval-lanceolate. British Guiana.—*T. Egertonianum*, Batem. Pseudobulbs clustered, oval, compressed, 2-lvd.: lvs. narrow ensiform, often $1\frac{1}{2}$ ft. long: fl. pale liver-color, dashed and veined with brown; sepals acute, the lateral ones reflexed; petals slightly acute. Honduras.—*T. latifolium*, Lindl. Lvs. obovate-oblong, 6 x 2 in.: fls. yellow and purple; lip with a fleshy yellow front lobe and narrow purplish side ones.—*T. obtusum*, Lindl. Pseudobulb oblong or elongate obovoid, 2-lvd., compressed: lvs. linear-lanceolate: fl. terminal; sepals reddish yellow, obovate; petals white, veined with rose, brown at the apex, obtuse; lip white, dorsally tubercled, lateral lobes red-margined, midlobe yellow in front. British Guiana. B.R. 1923.—*T. tenue*, Lodd. Pseudobulbs oval, compressed, 1-lvd.: lf. ensiform, very acute: fl. brownish purple; sepals reflexed, very acuminate; lip obtuse, glabrous, reflexed at apex. British Guiana.

F. TRACY HUBBARD.

TRILISA (anagram of *Liatris*). *Compósitæ*. Autumn-blooming plants 2 to 3 feet high, with numerous small, purple or white, rayless flower-heads.

Closely related to *Liatris*, from which it differs in the fibrous roots (those of *Liatris* being tuberous): the

infl. paniced instead of racemose or spicate, and the involucrel bracts in only 2 or 3 series, while those of *Liatris* are in many series.—Two species. *Trilisa* is not so well known to gardens as the *liatris*. Although a native of the low pine barrens from Va. to Fla. and La., it is hardy at N. Y., along the coast. It is mentioned in some English books as a hardy plant, thriving in light soil and prop. by division or by seeds sown in autumn. It is more fully described in the native botanies.

odoratissima, Cass. (*Liatris odoratissima*, Michx.). **VANILLA PLANT**. Also called Carolina vanilla, dog's-tongue, etc. Rather stout, glabrous, perennial herb, 2–3 ft. high, corymbosely branched above: lvs. thick entire or sometimes dentate, obtuse, 4–10 x 1–1½ in., oblong, ovate or oval, sometimes spatulate: infl. corymbosely-paniculate: fl.-heads about $\frac{1}{4}$ in. long. Aug., Sept. B.B. 3:319.—The other species (*T. paniculata*, Cass.) has a similar range and is distinguished by its viscid-pubescent st. and thyrsoïd-paniculate infl.

WILHELM MILLER.

TRILLIUM (Latin, *tripulum*, triple: leaves and floral parts in threes). *Liliaceæ*. **WAKE-ROBIN**. **BIRTHROOT**. **WHITE WOOD LILY**. **GROUND LILY**. Interesting and handsome perennial herbs, hardy and very useful for spring-flowering in the wild border or rockery or even in the garden border.

3844. Vertical rhizome of *trillium*. ($\times\frac{1}{2}$)

—About 30 species, N. Amer. and extra-Trop. Asia from the Himalayas to Japan.

Trilliums are amongst the characteristic flowers of American woods. The best-known species is *T. grandiflorum*, which ranges from Canada to the mountains of North Carolina and extends westward beyond the Great Lakes. All trilliums delight in moist rich soil. They thrive in woods mold. The root is a deep-seated mostly perpendicular rhizome (Fig. 3844). It is customary to transplant trilliums from the woods when in bloom. This is because the plants can be found readily at that time and because the desire to grow them is strongest when the plants are in flower. It is better to transplant in midsummer, or later, however, when the growth is completed, although the plants are difficult to find after the tops have died. The bloom is made largely from the energy stored in the tuber the previous season. After flowering, the plant stores energy for the succeeding year. By midsummer this work is accomplished and the tops die: then the plants are at rest and they are in proper condition to be moved. However, good results are sometimes secured by moving them in spring. These remarks will apply to most early spring-blooming small herbs. Give trilliums a rich deep rather moist soil in partial shade. Plant deep. A colony will last for years. Trilliums force well. See *Forcing*. Plants may be propagated by seeds sown as soon as ripe. Blooming plants may be expected in two or three years. Trilliums are among the choicest of all

early spring plants, and they should be more common in gardens. They can be made to thrive well in borders about city yards. They may also be colonized in grass where the lawn-mower is not used. Best results are usually attained, however, when they are planted alone in masses.

var. *californicum*.
($\times$ about $\frac{1}{4}$)

KEY TO THE SPECIES.

- A. Ovary 3-lobed, not winged.
 - B. Peduncle longer than the lvs. 1. *rivale*
 - BB. Peduncle shorter than the lvs.
 - C. Lvs. oblong, acute. 2. *nivale*
 - CC. Lvs. ovate, acuminate. 3. *undulatum*
- AA. Ovary 6-angled, often winged.
 - B. Lvs. sessile.
 - C. Lvs. sessile.
 - D. Blades broadly ovate or rhomboidal. 4. *sessile*
 - DD. Blades lanceolate. 5. *lanceolatum*
 - CC. Lvs. petioled.
 - D. Petioles short: petals oblong-lanceolate. 6. *recurvatum*
 - DD. Petioles as long as the blade or longer: petals oblanceolate. 7. *petiolatum*
 - BB. Fls. pedicelled.
 - C. Pedicel longer than the fl.: lvs. nearly or quite sessile.
 - D. Sepals much shorter than the petals. 8. *grandiflorum*
 - DD. Sepals nearly or quite as long as the petals.
 - E. Petals narrowly lanceolate or narrowly ovate (fls. white). 9. *ovatum*
 - EE. Petals ovate or broadly ovate (usually purplish).
 - F. Filaments stout, much shorter than the anthers. 10. *erectum*
 - FF. Filaments slender, as long as the anthers or nearly so. 11. *Vaseyi*
 - CC. Pedicel generally not exceeding and usually much shorter than the fl.
 - D. Fl. erect. 12. *pusillum*
 - DD. Fl. declinate under the lvs.
 - E. Lvs. rhombic or orbicular-rhombic. 13. *cernuum*
 - EE. Lvs. ovate-lanceolate. 14. *stylorum*

1. *rivale*, Wats. Sts. slender, 2-8 in. high: lvs. lanceolate, rounded or subcordate at base, acute or acuminate, 1-2 in. long; petioles 1-15 lines long: fls. white, on a slender rather erect or at length declinate pedicel, which is a little shorter than the lvs; petals rather rhombic, acute or acuminate, $\frac{1}{2}$ -1 in. long, more or less marked with purple. Stream-banks, mountains of Ore. and Calif. G.C. III. 54:43.—Allied to *T. nivale*, which it closely resembles in habit.

2. *nivale*, Ridd. A dwarf species, 5 in. or less high, early: lvs. narrow and obtuse, 1-2 in. long: fls. white, on a short erect or declined pedicel, the petals about 1 in. long, narrow and nearly or quite obtuse. Low woods, Pa. and Ky. to Minn. and Iowa. B.M. 6449.

3. *undulatum*, Willd. (*T. erythrocarpum*, Michx. *T. pictum*, Pursh). Of medium to large size, 1 ft. or more high: lvs. large, ovate and acute or acuminate, short-stalked: fls. rather large, white, on a short but slender erect or inclined pedicel, the petals oblanceolate and wavy, about 1 in. long and usually purplish at the base. Woods, Nova Scotia to Mo. and Ga. B.M. 3002. L. B.C. 13:1232.

4. *sessile*, Linn. Strong-growing, 1 ft. or less high: lvs. broadly ovate or rhomboidal, acute, more or less spotted: fls. sessile in the whorl of lvs., small, purple or greenish, the petals narrow and acute. Woods, Pa. to Minn., Ark., and Fla. B.M. 40. L.B.C. 9:875. F.S. 22:2311.—Variable. Var. *giganteum*, H. & A. (var. *angustipetalum*, Torr.). Similar to var. *californicum*, but the lvs. somewhat petiolate and the petals narrower. Calif. and Ore. Apparently not in the trade. The forms of *T. sessile* appear to be the only trilliums native to Calif. except *T. ovatum*. Var. *californicum*, Wats. (var. *giganteum*, Torr.). Fig. 3845. Much stouter, the lvs. often 6 in. long and spotted, and the petals sometimes 4 in. long: fls. purple, rose-color, or white, the petals rhombic-ovate or narrower. Calif. and Ore. G.F. 3:321 (adapted in Fig. 3845). Var. *Nuttallii*, Wats. (*T. viridescens*, Nutt.). Lvs. pubescent beneath, as also the upper part of the st.: petals linear-lanceolate, purplish green with brown base. Ark. Var. *rubrum*, Hort. A form of var. *californicum*, with fls. deep red-purple. Var. *Wrayi*, Wats. (*T. discolor*, Wray). Petals spatulate-obtuse, 1 in. long, greenish. Ga. B.M. 3097.

5. *lanceolatum*, Boykin (*T. recurvatum* var. *lanceolatum*, Wats.). Plant often more than 1 ft. tall: lvs. lanceolate, sessile: fls. dull or brown-purple, an inch or

3846. *Trillium grandiflorum*. ($\times \frac{1}{4}$)

more long, narrow-lanceolate or linear, the sepals ascending or somewhat reflexed, the filaments usually exceeding $\frac{1}{4}$ in. in length. Ga. and Ala.—Little known in cult.

6. *recurvatum*, Beck. Strong-growing, usually 1 ft. or more high: lvs. ovate or ovate-oblong, tapering to both ends, on short but slender petioles: fls. brown-purple or dull purple, about 1 in. or more long, the petals narrow and erect, the sepals narrow and reflexed. Woods, Ga. to Minn., Miss. and Ark.

7. *petiolatum*, Pursh. St. scarcely arising above the ground: lvs. ovate-elliptic to reniform, with stalks as long as the blade or even longer (blade 3–5 in. long): fls. purple, the petals 1–2 in. long and narrow-oblongate, the sepals erect. Idaho, Ore. and Wash.—Little known in cult.

8. *grandiflorum*, Salisb. Figs. 1558 (Vol. III), 3846. Stout, 1 ft. or more high: lvs. broad-ovate or rhombic-ovate, narrowed to both ends, often wavy: fls. erect or nearly so, pure white, changing to rosy pink as they fade, 2–3 in. long, the petals broadly oblanceolate and spreading and much longer than the sepals. Que. to Minn., Fla., and Mo. B.M. 855 (as *T. erythrocarpum*). L.B.C. 14:1349. G.C. III. 37:308. G. 9:663; 22:67; 28:173; 29:213; 36:703. G.L. 25:395. Gn. 29, p. 257; 36, p. 394; 40:222; 73, p. 167. G. M. 33:131. Gn. M. 8:172. G.W. 10, p. 36. F.W. 1880:257. Mn. 4:17. A.G. 17:243. Gng. 4:305; 6:161.—Sporting forms are not uncommon. Sometimes forms occur with petiolate lvs. A. G. 13:206. *T. grandiflorum* is the best and handsomest species for cult. Var. *roseum*, Hort. (*T. roseum*, Hort.), is a form with pink fls. Gn. 76, p. 229.

3847. *Trillium erectum*. ($\times \frac{1}{3}$)

sepals usually nearly as long as the petals: plants 1 ft. or less high: lvs. ovate to nearly orbicular, often somewhat rhombic. Calif. to Brit. Col.—The Pacific coast representative of *T. grandiflorum*.

10. *erectum*, Linn. (*T. pendulum*, Willd. *T. purpureum*, Kin. *T. fatidum*, Salisb. *T. atropurpureum*, Curtis). Fig. 3847. Stout, 1 ft. or more high: lvs. broadly rhombic-ovate: pedicel usually bent over or inclined but sometimes erect: fls. brown-purple to greenish purple, the petals usually about 1 in. long, ovate to lanceolate, not much if any exceeding the sepals. Nova Scotia to Man., N. C. and Mo. B.M. 470. L.B.C. 19:1838. F.S. 10:990. Mn. 2:49. G.C. II. 19:605. G.W. 10, p. 36.—The fls. of *T. erectum* are ill-smelling. Var. *album*, Lodd., has white fls. B.M. 1027. L.B.C. 19:1850. Var. *viridiflorum*, Hook. Fls. greenish. B.M. 3250. Not known to be in the trade.

11. *Váseyi*, Harbison. St. erect from a horizontal rootstock, 10–20 in. high, glabrous: lvs. sessile or subsessile, broadly roundish-rhomboidal, abruptly acuminate, 4–8 in. long: fls. dark purple, recurved or deflexed; sepals lanceolate to ovate-lanceolate, acute; petals about the same length, ovate or broadly ovate, acute or

obtuse. N. C., Tenn., and Ga., in the mountains.—Allied to *T. erectum*.

12. *pusillum*, Michx. Small, usually not 1 ft. high: lvs. lanceolate or oblong, obtuse, sessile: fls. pale flesh-color, less than 1 in. long, on a short erect pedicel, petals lanceolate and exceeding obtuse petals. Pine lands, N. C., S. C.

13. *cernuum*, Linn. Plant 1 ft. or more high: lvs. very broadly rhombic-ovate, nearly or quite sessile: fls. white, the petals 1 in. or less long, ovate-lanceolate, wide-spreading or reflexed, undulate, equaling or exceeding the sepals. Newfoundland to Ga. and Mo. B.M. 954. Mn. 10:49.

14. *stylodum*, Nutt. (*T. nervosum*, Ell., and *T. Catesbaei*, Ell.). Slender, 12–18 in. high: lvs. ovate-lanceolate, narrow at each end, short-stalked: fls. rose-color, the petals oblong, obtuse or acute, curved, undulate, sometimes 2 in. long. N. C. to Fla.

T. Govenianum, Wall. A species of Temp. Himalaya, little known and described by Hooker as follows: "Lvs. shortly petioled, ovate or ovate-cordate, acute: sepals subequal, narrowly linear."—*T. obovatum*, Pursh. Founded on a Canadian plant, which has been referred to *T. erectum*. Maximowicz keeps it distinct, however, extending its range to Kamchatka and Japan. It is the *T. erectum* var. japonicum, Gray. According to Watson, the Japanese plant "is distinguished by a somewhat produced connective (between the anther-cells) and very short stigmas." Maximowicz says that the plant differs from *T. erectum* in the petals being broader and more obtuse and longer than the calyx, the fls. nodding from the first, and the lvs. broader than long, sessile, not attenuate at the base.—*T. Smallickii*, Maxim. One of the *T. erectum* series (*T. erectum* var. japonicum flore-pleno, Gray), of Japan. Fls. smaller than those of *T. obovatum* (2 in. across), deep tawny red, the petals not exceeding the sepals, nearly orbicular or obovate.—*T. Tschonoskii*, Maxim. About 1 ft. tall: lvs. sessile, broad-ovate or orbicular, somewhat rhombic, acuminate: fls. dull purple, 1 in. or less across, the petals oblong-lanceolate. According to Hooker, this differs from *T. erectum* chiefly in the longer filaments. Himalaya to Japan.

L. H. B.

F. TRACY HUBBARD.†

TRIÓSTEUM (name shortened by Linnaeus from *Triosteospermum*, which is from Greek for *three bony seeds*). *Caprifoliaceae*. **FEVERWORT**. **HORSE GENTIAN**. Coarse hardy perennial herbs, glabrous or glandular-pilose: sts. rather simple, terete: lvs. opposite, sessile, rather fiddle-shaped or obovate, entire: fls. usually axillary, solitary or clustered, dirty white, yellow, or purple; calyx-tube ovoid, limb 5-lobed, persistent; corolla tubular-campanulate, base of tube gibbous, limb oblique, lobes unequal; stamens 5; disk small, swollen; ovary 3–5-celled: berry fleshy or leathery, 2 (rarely 3–5)-celled, 2–3-seeded.—About 8 species, N. Amer., Himalayas, and China.

perfoliatum, Linn. St. 2–4 ft. high, stout: lvs. ovate, shortly acuminate, narrowed below into connate-perfoliate or simply connate base: corolla dull brown-purple. Rich soil, New England and Canada to Ill. and Ala. B.B. 3:234.—Sometimes offered by collectors. It is a weedy plant of very easy cult. F. W. BARCLAY.

TRIPETALÈIA (Greek, *three* and *petals*). *Ericaceae*. Two species of Japanese shrubs with deciduous alternate, short-petioled entire lvs. and white or pinkish fls. in terminal racemes or panicles: sepals and petals 3; stamens 6, shorter than the petals, the anthers opening with a longitudinal slit; ovary 3-celled, superior, short-stalked; style slender, curved: caps. septicial, many-seeded. Closely allied to *Elliottia*, but easily distinguished by its 3-merous fls. *T. paniculata* has proved hardy at the Arnold Arboretum; it seems to like humid, but well-drained, peaty or sandy soil and will probably grow best in a rockery in a partly shaded place. The second species was only recently intro. and has not yet been tested. Prop. is by seeds treated like those of *rhododendron* and probably also by cuttings. *T. paniculata*, Sieb. & Zucc. Shrub, to 6 ft.: lvs. short-petioled, rhombic or rhombic-obovate, acute, cuneate at the base, glabrous except a few hairs on the midrib beneath, 1–2½ in. long: fls. in panicles 2–4 in. long, white, tinged pink, ¼ in. long, style exserted; bracts subulate. Aug.

CXIII. *Tsuga canadensis*.—The hemlock spruce of the northeastern United States and Canada.

Japan. *T. bracteata*, Maxim., has smaller obovate obtuse lvs. and pink fls. in racemes, with elliptic or obovate bracts. Japan. ALFRED REHDER.

TRIPHÀSIA (from the Greek for *triplex*). *Rutaceæ*, tribe *Citreae*. Small ornamental shrubs or trees distantly related to the orange, sometimes used as hedge-plants.

Plants with spreading branches: spines double, axillary; lvs. alternate, sessile, trifoliate: fls. cupulate, 3-merous, white, stamens 6, free: fr. an ovate berry filled with a sweet, sticky pulp and containing usually a solitary seed.—Only 1 species is known.

trifolia, P. Wilson (*Limnònia trifolia*, Burm. *T. aurantioides*, Lour. *T. trifoliata*, DC.). LIME-BERRY. Fig. 3848. A shrub or small tree, sometimes attaining a height of 15 ft.: lvs. trifoliate, dark green; lfts. ovate, retuse, entire-margined, lateral ones smaller than the central one; spines in pairs, straight, very sharp, shorter than the lvs.: fls. white, fragrant, axillary, solitary; petals thick; stamens free, filaments subulate, shorter than the corolla; style thick, longer than the stamens: fr. ovate, small, dull red, $\frac{1}{2}$ in. diam., having a thick skin, 1-celled, generally with only a single large seed, imbedded in the mucilaginous spicy pulp. Burmann, Fl. Ind., tab. 35. Jacq. Icon. pl. rar. v. 3, pl. 463. L.B.C. 1:18. Riss. & Poit. Hist. nat. or. 2 ed., pl. 108.—Of unknown nativity but widely cult. and naturalized in tropical and subtropical regions, being grown as an ornamental plant. Prop. by seed. The frs., which are filled with a highly aromatic juicy pulp, are sometimes used in tropical countries for making marmalade. The shrub is attractive, flowering and fruiting freely and is used for lawn planting and hedges, but it is injured by severe frosts. This species is able to grow in soil too salty to support the common citrus frs. and is being tested as a stock for use on such soil. WALTER T. SWINGLE.

TRIPHÒRA (Greek, bearing three flowers). *Orchidaceæ*. Terrestrial plants with leafy sts. and fleshy tubers. Fls. axillary, solitary or several; sepals free, equaling the petals; lip erect, not crested, spurless, 3-lobed; column elongated, clavate; pollinia granular-powdery, tailless.—Species about 10, American. By some authors retained in *Pogonia*.

trianthophora, Rydb. (*T. pendula*, Nutt. *Pogonia pendula*, Lindl.). Sts. sometimes tufted, 2–12 in. tall: lvs. nearly orbicular to ovate, 2–8 in. long, clasping: fls. single, or 2–7, drooping, pale purple; sepals and petals obtuse, elliptic; lip about as long as petals, narrowed into a short claw. E. N. Amer. B.R. 908.

GEORGE V. NASH.

TRIPLÀRIS (Latin, from *triplex*, the parts of the fructification are in 3's). Syn., *Velasquèzia*. *Polygonaceæ*. Trees grown out-of-doors in the extreme S., in the warmhouse in the N. Lvs. alternate, short-petioled, usually large, ovate-oblong or lanceolate: fls. sessile or subsessile between bracts, arranged in pilose, simple, long spikes or often in racemes, dioecious; male perianth funneliform, limb 6-cleft, stamens 9, ovary rudimentary or none; female perianth narrow, deeply 6-cleft, ovary acutely 3-angled; nut prominently subacutely 3-angled.—About 20 species, Trop. S. Amer.

americana, Linn. Small tree: lvs. petiolate, ovate, acuminate: spikes pilose, bracts ovate, acuminate, small, pilose: calyx in fr. very long, tube ovate with spreading lanceolate wings; lobes subulate: achene ovate, 3-angled. Cent. Amer.—An insufficiently studied and much confused species.

TRÍPSACUM (Greek, to rub or thresh, probably alluding to the ease with which the fertile spike can be broken up). *Gramineæ*. Perennial grasses with stout culms and monœcious infl., in spikes terminating the

culm and branches: fls. monœcious, in the same spike, the staminate above; spikes terminal and axillary; staminate spikelets 2-fld., in pairs at each joint; pistillate single, 1-fld., imbedded in each joint of the rachis, so that the smooth cartilaginous axis and the outer glume form a nearly cylindrical mass; at maturity the pistillate spikes separate into the joints.—Species about 6, of the warmer parts of N. Amer., one extending north to Cent. U. S. and in many places furnishing considerable native fodder.

dactyloides, Linn. (*T. violaceum* and *T. Dactylis* of the trade). GAMA-GRASS. SESAME-GRASS. Culms in bunches, 4–7 ft.; spike 2–3 at summit and often single from the upper axils. Moist soil, Conn., Ill., Kans.,

3848. *Triphasia trifolia*. ($\times \frac{1}{2}$)

and southward. Dept. Agric., Div. Agrost., 20:13.—A wild fodder-grass, sometimes cult. for forage and also in gardens as a curiosity. Raised from seed, or more certainly from cuttings of the rootstocks.

For an illustrated account of *Tripsacum-Euchlaena* and *Tripsacum-Zea* crosses, see article by Collins and Kempton, Journal of Heredity, March, 1916.

A. S. HITCHCOCK.

TRIPTYERYGIUM (Greek, three and wing, in reference to the 3-winged fr.). *Celastraceæ*. Three shrubs from E. Asia with deciduous alternate rather large lvs. and small white fls. in terminal panicles: fls. polygamous; calyx 5-lobed; petals 5; stamens 5, inserted at the margin of a cupular disk; ovary superior, 3-angled, incompletely 3-celled, with short style: fr. a 3-winged, 1-seeded nutlet. The following species has proved hardy at the Arnold Arboretum and is a handsome shrub conspicuous chiefly on account of its large bright green foliage contrasting well with the reddish brown sts. terminated in July and Aug. by conspicuous panicles of small whitish, fragrant fls. It apparently grows well in any soil. Prop. is by seeds and probably by cuttings. T. Régeli, Sprague & Takeda (*T. Wilfordii*, Regel, not Hook. f.). Glabrous shrub, to 2 ft., with angled warty reddish brown branches: lvs. petioled, broadly elliptic, acuminate, broadly cuneate at the base, serrate, 3–6½ in. long: fls. greenish white, $\frac{1}{2}$ in. across, in terminal panicles leafy at the base, and to 8 in. long: fr. little over $\frac{1}{2}$ in. long, with 3 broad wings. July, Aug. Manchuria, Korea, Japan. Gt. 18:612. Not yet in the American trade. ALFRED REHDER.

TRISSETUM (Latin, *three* and *bristles*: the florets are 3-awned). *Gramineæ*. Tufted hardy perennials of no real horticultural interest: infl. terminal spike-like or loose panicles: spikelets 2 (rarely 3-5)-fld.; rhachilla prolonged beyond the upper palea; glumes unequal, keeled; lemma membranaceous, keeled, 2-toothed at apex, bearing a slender dorsal awn; palea narrow, 2-toothed. About 90 species, widely distributed throughout the temperate regions of the world. *T. flavescens*, Beauv. (*Arëna flavescens*, Linn.). Culms $1\frac{1}{2}$ -2 $\frac{1}{2}$ ft. high, erect, simple, glabrous: sheaths shorter than the internodes; ligule $\frac{1}{2}$ in. long; blades $1\frac{1}{2}$ -5 in. long, 1-3 lines wide: panicle open; branches somewhat flexuous: spikelets 3-4-fld.; glumes smooth or scabrous; awn long, bent, and twisted. Eu., Asia, and intro. into Amer. B.B. (ed. 2) 1:217. Not in common cult., but occasionally used in agriculture. F. TRACY HUBBARD.

3849. *Tristania conferta*. (× $\frac{1}{4}$)

TRISTAGMA (Greek, *three drops*, alluding to the 3 nectar-glands of the ovary). Including *Stephanolirion*, *Liliaceæ*. Herbs with subglobose tunicate corms, used for fall-blooming. Lvs. radical, few, narrowly linear: scape simple, leafless: fls. in a terminal umbel, not numerous, pedicelled; perianth salver-shaped, tube cylindrical, 6-lobed; crown fleshy at the throat or lacking; stamens 6, in 2 rows; ovary sessile, ovoid, 3-celled: caps. loculicidally dehiscent.—About 7 species, Chile and Patagonia; probably to be planted in spring in this country.

nivale, Poepp. (*Milla nivale*, Baker). Lvs. 6-9 in. long, about 2 lines wide: scape slender, about 1 ft. long: fls. 1 in. long, 2-8 in an umbel, the segms. linear and greenish; crown none.—Now treated by Baker as *Brodiaea nivalis*, Baker. Likely to be offered by Dutch bulb-growers.

T. narcissoides, Benth. & Hook., does not appear to be in the American trade. It is 1 ft. or more high, with short narrow-linear lvs., and white fls. bearing a bright orange narcissus-like crown of 3-6 broad unequal more or less connate scales.

F. TRACY HUBBARD.†

TRISTANIA (in honor of Jules M. C. Tristan, 1776-1861, a French botanist). *Myrtaceæ*. Tall trees or shrubs, evergreen, cultivated as greenhouse shrubs in Europe and hardy in California and Florida.

Leaves alternate or somewhat whorled and approximate at the ends of the branches, rarely opposite: fls. usually rather small, yellow or white, in axillary, peduncled cymes; calyx-tube turbinate-campanulate, limb with 5 short segms.; petals 5; stamens numerous; ovary inferior or semi-superior.—About 23 species, Malaya, New Caledonia, and Austral. Prop. by half-ripened cuttings in sand under glass, or by seeds.

conferta, R. Br. (*Lophostemon arborëscens*, Schott). BRISBANE BOX. Fig. 3849. An umbrageous tree attain-

ing 150 ft.: young shoots and calyx hoary-pubescent: lvs. 3-6 in. long, ovate-lanceolate, glabrous, usually crowded at the ends of the branches and apparently verticillate: fls. mostly on the branches well below the lvs.; petals about $\frac{1}{4}$ in. long, white and spotted, fringed. Queensland. B.R. 1839 (as *T. macrophylla*).—A handsome evergreen shade tree, valuable for avenues in hot dry regions, as it withstands great drought; it also produces timber valued for strength and durability. Much grown in New S. Wales as a boulevard tree. Hardy in Cent. Calif., withstanding an exceptional temperature of 26° F. at Berkeley.

JOSEPH BURTT DAVY.

TRISTELLATEIA (Latin, *three* and *star*: each flower has 3 winged frs. which have the appearance of stars). *Malpighiaceæ*. Scandent shrubs, probably adapted only to the warmhouse. Lvs. opposite or verticillate in 4's, entire, petioles usually 2-glandular at the top, base with 2 very short stipules: racemes terminal or lateral, sometimes paniculate: fls. yellow; calyx 5-parted; petals clawed, keeled outside, sagittate-ovate; stamens 10, all perfect; ovary 3-lobed: samaras 3, many-winged. About 20 species, Madagascar, Indian Archipelago, and Austral. *T. australis*, A. Rich. Strong climbing shrub with pendent shoots: lvs. ovate or ovate-oblong, 2-4×1-2 $\frac{1}{4}$ in., glabrous: racemes 2-6 in. long, 12-16-fld.: fls. opposite, short-peduncled, yellow; petals 5, oblong or ovate-oblong, 5-6 lines long; filaments finally deep red. Malaya and Australasia. B.M. 8334.

TRITELEIA: *Brodiaea*. The following species, listed under *Triteleia*, is to be combined with the treatment of *Brodiaea* in Vol. I, p. 576. **B. uniflora**, Baker (*Triteleia uniflora*, Lindl. *Milla uniflora*, Graham). **SPRING STAR-FLOWER**. Lvs. narrow-linear, 1 ft. or less long: scapes 8 in. or less tall, bearing a bract-like spathe toward the top: fl. 1 (rarely 2), 1-1 $\frac{1}{2}$ in. across, pale lilac or pale blue, with pointed segms. violet-streaked through the center. Argentina. B.R. 1921. B.M. 3327. G. 3:115; 36:610. Gn. 67, p. 203; 68, p. 365. Gt. 61, p. 219. G.W. 15, p. 624. R.H. 1859, pp. 350, 351. Gng. 2:59. Hardy in most of the northern states, although it does not persist long. Grown chiefly as a pot-plant for spring bloom. Var. *cærulea*, Hort., has porcelain-blue fls. There are other horticultural forms. *T. violacea*, with "delicate violet fls.," is probably a form of this species rather than the *T. violacea*, Kunth, a Chilean species.

L. H. B.

TRITHRINAX (apparently *triple Thrinax*, alluding to leaf-division). *Palmaceæ*, tribe *Coryphææ*. South American fan palms, some of which are known to be cultivated in the open in the United States.

The genus is distinguished from allied genera chiefly by the following characters: fls. hermaphrodite; petals imbricate; filaments connate into a tube: carpels distinct; styles long, distinct, terminal in fr.—Five species. *T. brasiliensis* is a little-known palm. It seems to have been confused in the trade with *Thrinax Chuco*, which is referred in this work to *Acanthorhiza Chuco*. The lf.-segms. of the former are bifid; of the latter apparently not. André says the first species described below is unique by reason of its sheaths at the base of the lvs. These, he says, "are composed of fibers which are at first parallel and longitudinal, then obliquely intercrossed and finally plaited at right angles like the mats of pandanus in which the coffee of the Antilles and Bourbon is exported. At the summit these narrow strips unite and form a series of very long, robust, recurved spines which are evidently designed to protect the fls. and frs. against climbing animals." Not in common cult. in Amer., although 3 of the 5 known species are planted.

brasiliensis, Mart. Trunk slender, 6-12 ft. high, 2-3 in. thick: lvs. palmate-flabelliform, glabrous and often

glaucous, the lf.-segms. 22-30, linear, free for two-thirds their whole length, deeply bifid: spadix much branched, with many spirally arranged fls. on its branchlets: stamens 6. Brazil. I.H. 22:202.

campestris, Drude & Gris. Fig. 3850. Differs from *T. brasiliensis* in the segms. being shallowly bifid and

3850. *Trithrinax campestris*.

white-tomentose above but nearly glabrous beneath, and with stouter spadix branches: plant more rigid. Argentina.—Said to be a striking palm.

acanthocoma, Drude. Dwarf, stout, with many strong reflexed spines, the caudex with netted sheaths: lvs. large, fan-like, cut nearly to base into about 40 narrow bifid segms.: spadix branched. Brazil. Gt. 27:361.

L. H. B.†

TRÍTICUM (old Latin name for wheat). *Gramineæ*. The genus as now limited comprises 2 sections, *Ægilops*, with 12 species of S. Eu. and Asia, one of which is thought by some to be the original of the cult. wheats; and *Triticum* proper, which includes wheats and spelts themselves, that are referred by Hackel to 3 species. Annual grasses with fls. in a terminal spike: spikelets 2-5-fld., placed flat-wise, singly on opposite sides of a zigzag rachis; glumes ovate, 3- to many-nerved, these and the lemmas more or less awned: grain free. The common wheat is *T. aestivum*, Linn. (*T. sativum*, Lam. *T. vulgare*, Vill.). (For account of a wild species of Syria, the probable ancestor of wheat, see Aaronsohn, Bull. Soc. Bot. France, 56:237). *T. Richardsonii*, Trin. Under the name *Cryptopyrum Richardsonii*, Schrad., this species has sometimes been catalogued by seedsmen as an ornamental plant. It is a perennial with a slender nodding spike of awned spikelets. The species properly belongs in *Agropyron* (*A. Richardsonii*, Schrad.) and resembles the wild *A. caninum*, Linn., with which some authors unite it. It is native from Que. across the continent. A. S. HITCHCOCK.

TRÍTOMA: *Kniphofia*.

TRITONIA (name explained as follows by Ker-Gawler, its author: "Name derived from *Triton*, in the signification of a vane or weathercock; in allusion to the variable direction in the stamens of the different species"). Including *Montbretia*. *Iridacæ*. BLAZING STAR. Showy-flowered corm-bearing herbs used both as greenhouse and summer-blooming subjects.

Corms or bulbs small, covered with fibrose sheaths or tunics: sts. simple or slightly branched: lvs. few, narrow-linear or broader and sword-shaped, usually falcate: spathes disposed along the rachis or the few branches,

short, membranaceous, often 3-toothed: fls. 1 to a spathe, sessile; perianth-tube slender, limb concave or broadly campanulate, lobes obovate or oblong, nearly equal; ovary 3-celled: caps. membranaceous, ovoid or oblong.—About 50 species, S. Afr. Allied to *Crocsmia*, *Acidanthera*, *Sparaxis*, and *Gladiolus*. Few of them are in general cult., although many of the species have been intro. at one time or another. Those of the *Montbretia* class are showy hardy summer-flowering bulbs, to be handled like gladioli; or they may be left in the ground permanently if given protection of mulch in cold climates. As far north as N. Y. and Mass., however, they are usually best wintered in damp (not wet) earth indoors. The best-known kinds are *T. crocosmaeflora* and *T. Pottsii*. Most of the Latin names in catalogues belong to these, as *sulphurea*, *tigridia*, *pyramidalis*, *grandiflora*, *elegans*, *floribunda*. To gardeners, tritonias are usually known as montbretias. Garden tritonias grow 1 ft. or more tall, producing several to many showy fls. of a yellow, orange, or red color, and bearing several stiffish linear or sword-shaped lvs.

A. Three lower perianth-segms. bearing hatchet-shaped processes.

bracteata, Worsley. True lvs. about 3, appearing after flowering, about 1 ft. high and $\frac{1}{2}$ in. broad; the early lvs. are really bracts: scape about 1 ft. high, flexuous, much branched: fls. 30-40, tawny red, scentless, opening singly or in 2's, subtended by the large foliose bracts, irregular in shape, about 1 in. across; outer segms. about $\frac{1}{4}$ in. broad, inner segms. about $\frac{1}{8}$ in. broad and recurved. S. Afr.

AA. Three lower perianth-segms. without hatchet-shaped processes.

B. Fls. hooded.

Clusiæna, Worsley. Allied to *T. securigera*, from which it differs in having lvs. twice as long and wide, no obtuse or other indentation on the outer spathe-valves: plant about 1 ft. high: fls. orange (?), hooded, all facing one way. S. Afr.—This species with hooded fls. seems to form a link between *Tritonia* and *Antholyza*.

BB. Fls. not hooded.

C. Perianth-segms. obovate.

crocata, Ker-Gawl. Slender, simple or branched from near the base, bearing few fls. in loose 1-sided racemes: fls. about 2 in. across, tawny yellow or orange-red, the stamens one-third the length of the perianth-limb. Cape Colony. B.M. 184 (as *Ixia crocata*). Gn. 54: 82. Var. *miniata*, Baker (*T. miniata*, Ker-Gawl.), has light red fls. B.M. 609. There are color varieties, as *purpurea*, Hort., *coccinea*,

3851. *Tritonia Pottsii*. ($\times \frac{1}{4}$)

ea, Hort., and *aurantiaca*, Hort.—These plants are usually treated as greenhouse bulbs in the N.

cc. *Perianth-segms. oblong.*

rôsea, Klatt. Tall and branched, with short linear lvs. and loose 6–15-fld. racemes: fls. bright red, with oblong segms. (the 3 lower ones yellow-blotched at the base) as long as the tube and anthers just protruding from the tube. Cape Colony. B.M. 7280.—Can be left in the open as far north as Mass., if well protected, but are usually safer if taken up.

Pötsii, Benth. (*Monibretia Pötsii*, Baker). Fig. 3851. Strong branching plant 2–4 ft. tall, with several lax racemes, and few or several firm narrow lvs.: fls. about 1 in. long, bright yellow tinged red, the tube broadly funnelform and twice longer than the oblong unequal ascending segms., the stamens about half the height of the limb. Natal, Transvaal, etc. B. M. 6722. G.C. III. 7:301, showing how the corms form one above the other.

crocosmæflora, Lemoine (*T. Pötsii* × pollen of *Crocasmia aurea* [Fig. 1112, Vol. II]). Fig. 3852. Slender much-branched erect plant 3–4 ft. high, with several or many sword-shaped lvs., and loose more or less distichous racemes: fls. 2 in. across, orange-crimson, with a slender curved tube nearly or quite equaling the oblong spreading segms. R.H. 1882: 124. Gn. 25, p. 363; 31:490. G. M. 36: 484. G.Z. 27:169.—*Crocasmia aurea* was intro. (into England)

3852. *Tritonia crocosmæflora*. (× 1/2)

in 1847, and *Tritonia Pötsii* (into Scotland) in 1877 by G. H. Pöts. Victor Lemoine, at Nancy, France, hybridized the two, and the product, *T. crocosmæflora*, bloomed in 1880. This hybrid is now the most popular of tritonias (or montbretias).

The following varieties are offered in the trade under the generic name Montbretia; as they are mainly color-forms it seems inadvisable to make new combinations for them, and they are accordingly retained under the trade name. *Monibretia crocosmæflora* var. *aurantiaca*, Hort. (*M. aurantiaca*, Hort.), has deep orange fls. Var. *californica*, Hort. (*M. californica*, Hort.), has golden yellow fls. Var. *germanica*, Hort. (*M. germanica*, Hort.), has glowing orange-scarlet fls., with blood-red throats. Var. *pyramidalis*, Hort., is offered in the trade. Var. *speciosa*, Hort. (*M. speciosa*, Hort. *T. speciosa*, Hort.), is said to have close spikes of rich deep yellow fls., the reverse side apricot. J.H. III. 48:391.

Some of the following plants occur in the trade under Montbretia and have never been transferred to Tritonia. They are little known botanically and in some cases are probably hybrids or forms of *T. crocosmæflora* and are here listed as Montbretias as signified by the M. before the specific name.—*T. aurea*, Pappe (*M. aurea*, Hort.). See *Crocasmia aurea*.—*T. crispa*, Ker-Gawl. Fl. whitish or pale pink, with oblong, obtuse segms. and with crisped lvs. B.M. 678.—*T. deusta*, Ker-Gawl. Differs from *T. crocata* in having a purple-black blotch on the claw of the 3 outer segms. B.M. 622.—*M. elegans*, Hort., has yellow and apricot fls.; possibly a form of *T.*

crocosmæflora.—*T. flava*, Ker-Gawl. Fls. bright yellow, the segms. oblong and the 3 lower ones with a callus in the throat: lvs. very short. B.R. 747.—*M. germanica*, Hort., is offered in the trade as a form with scarlet fls., shaded with orange, 3 in. across.—*T. hyalina*, Baker. Differs from *T. crocata* in having the perianth-segms. narrowed at the lower part into a claw with hyaline margin. B.M. 704 (as *T. fenestrata*).—*T. lineata*, Ker-Gawl. Fls. white or pink, with short oblong segms. and protruding anthers, of the shape of gladiolus fls. B.M. 487 (as *Gladiolus lineatus*).—*M. Prometheus*, Hort., is a horticultural form which grows up to 4 ft. high, with branching spikes of rich orange or orange-red fls., 3½ in. across, their center crimson. Gn. 71, suppl. Jan. 19. G.M. 49:815.—*M. rôsea*, Hort., is offered in the trade as a form growing 3 ft. or more high with long arching spikes of rose or bright salmon-rose fls.—*T. scillaris*, Baker. Small and slender: fls. pink, with wide-flaring narrow segms., ixiolike. B.M. 629 (as *Ixia polystachya*).—*T. securigera*, Ker-Gawl. Lvs. short: fls. red or copper-colored, the 3 lower segms. with a callus on the claw. B.M. 383 (as *Gladiolus securiger*).—*T. undulata*, Baker. Lvs. short and narrow, much crisped: fls. pink, with oblong equal segms. B.M. 599 (as *Ixia crispa*).—*T. viridis*, Ker-Gawl. Lvs. plane or crisped, linear: fls. green, with nearly equal obovate-lanceolate segms. B.M. 1275.—*T. Wilsonii*, Baker. Lvs. very narrow-linear: racemes simple or forked, lax, few-fld.: fls. white, tinged with purple, the segms. obovate-cuspidate.

L. H. B.

F. TRACY HUBBARD.†

TRIUMFETTA (named for Giov. B. Trionfetti, 1658–1707 or 8). *Tiliaceæ*. Herbs, subshrubs, or shrubs, which have been sometimes grown in the warmhouse or greenhouse. Plants stellate-pubescent: lvs. serrate, entire, or 3–5-lobed: fls. yellow, axillary or opposite the lvs., few or densely fasciculately cymose; sepals 5; petals 5, rarely none; stamens numerous; ovary 2–5-celled, cells 2-ovuled: caps. small, subglobose, spiny or bristled. About 100 species, widely dispersed over the world. Several species have been intro. abroad but none of them is cult. to any extent.

TROCHËTIA (named for R.I.G. du Trochet, 1771–1847, Paris). *Sterculiaceæ*. Shrubs or trees, evergreen, grown in the warmhouse or coolhouse. Lvs. entire, leathery: peduncles axillary, 1–3-fld.: fls. usually pendulous, rather large; calyx 5-parted, leathery; petals 5, flat, broad, and persistent; staminal column short, bearing 5 ligulate staminodia; anthers 10, 15, or 20, stipitate; ovary sessile, 5-celled, cells with many ovules: caps. loculicidally 5-valved.—About 6 or 7 species, natives of Mauritius, St. Helena, and Mascarene Isls.

Blackburniæna, Bojer. Shrub or small tree; branches, petioles, and ribs of the lvs. rusty-scurfy with stellate hairs: lvs. long-petioled, elliptic- or obovate-oblong, acute, entire, or crenate-serrate, 7-ribbed from the base, which is slightly cordate: peduncles above the axils, 1-fld., 2-bracted: fls. large, campanulate; sepals elongated lanceolate; petals obliquely obovate-rotundate, white, rose-veined, margins blood-red. Mauritius. B.M. 7209. G.C. III. 36:112.

TROCHODÉNDRON (Greek, *wheel* and *tree*, alluding to the appearance of the fls., the anthers of the numerous spreading stamens forming a ring.). *Trochodendraceæ*. Evergreen tree with aromatic bark and foliage, with alternate or whorled long-petioled lvs. and small fls. in terminal upright racemes: fls. long-pedicelled, perfect, without perianth; stamens numerous, filaments slender: carpels 6–10 in one whorl, connate below, with short linear spreading styles: fr. consisting of 6–10 follicles inserted below in the fleshy receptacle, dehiscent at the apex, with several linear seeds in each carpel. The tree is probably not in cult. in this country, but may be recommended for its handsome evergreen foliage for the middle and southern Atlantic states and for Calif. *T. aralioides*, Sieb. & Zucc. Tree, to 50 ft., or in cult. spreading shrub, glabrous: lvs. rhombic-obovate to elliptic-lanceolate, obtusely acuminate, crenate-serrate, lustrous and dark green above, lighter green beneath, 2–5 in. long; petioles 1–3 in. long: fls. green, ¾ in. broad across the stamens; anthers yellow: fr. brown, ½–¾ in. across. June. S.Z. 1:39. B.M. 7375. S.I.F. 1:42. G.C. III. 15:725. J.H.S. 27, p. 867. R.B. 30:86.

ALFRED REHDER.

TROLLIUS (old German, *trol*, something round; *trollblume*, in allusion to the shape of the flowers). *Ranunculaceæ*. **GLOBE-FLOWER**. A group of neat hardy herbaceous perennials of a dozen or more species, mostly found in moist or marshy places of the North Temperate zone; useful in garden borders.

Roots fibrous, thickened: lvs. palmately divided or lobed: fls. large, solitary, whitish, yellow, golden yellow, or purplish, those in cult. usually yellow- or orange-fld.; petals 5 to many, small, unguiculate, with a nectariferous pit at the base of the blade; sepals 5-15, large, usually constituting the showy part of the fl.; stamens many; carpels 5 to many, sessile, many-ovuled: follicles in a head.—Very like *Ranunculus* in general appearance, but distinguished at once by bearing follicles rather than achenes. For monograph, see Huth, in *Helios* ix. (Berlin), 1892; and for the Eastern Asian species, Finet & Gagnepain, *Contrib. Fl. As. Or.* 1: 136-139; also in *Bull. Soc. Bot. France* 51:393-396 (1904).

Trolliuses are grown for the beauty of their globular flowers and show of dark green leaves. They are suited to wet sunken gardens, wild borders, and edges of water-gardens, although in a good garden soil not lacking in moisture they do well. They may be increased either by seeds or by dividing the old plants; but the young plants grow slowly at first, and will not flower before the second season from seed. The usual globe-flower of the horticulturist is *T. europæus*, with incurving sepals so that the flower has a ball-like appearance; in most of the species the sepals spread nearly or quite horizontally. They bloom in spring and early summer.

INDEX.

<i>acaulis</i> , 12.	<i>dschungaricus</i> , 3.	<i>Ledebouri</i> , 5, 8.
<i>albiflorus</i> , 11.	<i>europæus</i> , 1.	<i>Loddigesii</i> , 1.
<i>altaicus</i> , 4.	<i>genuina</i> , 8.	<i>napelliformis</i> , 1.
<i>americanus</i> , 11.	<i>giganteus</i> , 2.	<i>patulus</i> , 8.
<i>asiaticus</i> , 2.	<i>globosus</i> , 1.	<i>pumilus</i> , 8, 9, 10.
<i>caucasicus</i> , 4, 9.	<i>japonicus</i> , 7.	<i>sinensis</i> , 6.
<i>chinensis</i> , 6.	<i>laxus</i> , 8, 11.	<i>yunnanensis</i> , 8, 10.

A. Number of sepals exceeding 10 (15-20).

B. Sepals incurved, forming a globe-shaped fl.

1. *europæus*, Linn. (*T. globosus*, Lam.). Fig. 3853. Sts. erect, 15 in. or more high, often branching; lower lvs. petioled, others sessile; lfts. only 5-parted, lobed, cleft, and toothed, those of the root-lvs. on short petioles: fls. of a lemon-yellow color, solitary or in 2's, 1-2 in. across, globular in form; sepals 10-15, ovate; petals spatulate, often longer than the stamens: fr. much as in *T. laxus*. Wet upland meadows of N. Eu. May-July. Gn. 40:102; 71, p. 310. G. 19:609. G.W. 15, p. 129. J.H. III. 51:594; 54:555.—Different forms are offered or sometimes listed. Var. *Loddigesii*, Hort., has deep yellow fls.

Var. *napelliformis*, Huth (*T. napelliformis*, Roep.). St. many-fld. and lvs. deeply divided.

BB. Sepals spreading, making an open fl.

c. Petals longer than the stamens.

2. *asiaticus*, Linn. Plant much like *T. europæus*, often taller, the smaller bronze-green lvs. more finely lobed and cleft: fls. a rich orange-color with sepals spreading. May. Siberia. B.M. 235.—The blossoms of this are well suited for cut-fl. purposes. The plants thrive best and produce richest colors if partially exposed to the sun. *T. giganteus*, found in garden lists, is a very tall form of this species.

cc. Petals shorter than the stamens or not exceeding them.

3. *dschungaricus*, Regel. Much like *T. europæus*, but fls. open or spreading, golden yellow within and reddish outside; sepals about 15, rounded and mucronate; style subulate and straight. Turkestan.—Mentioned in foreign lists.

4. *altaicus*, C. A. Mey. (*T. caucasicus* var. *altaicus* Fin. & Gagn.). Plant 1-2 ft., with foliage much like that of *T. europæus*: fls. large (2 in. across), yellow or pale orange, with 15-20 broad and obtuse sepals (perhaps sometimes as few as 10); petals 5-15, narrowly linear and obtuse. Altai region, Siberia. Gt. 6:66.—Little known in the trade.

AA. Number of sepals 5-10, spreading.

B. Petals one-third or one-half longer than the stamens.

5. *Ledebouri*, Reichb. f. Plant about 2 ft., with lvs. divided to the base and the divisions lobed and toothed: fls. yellow, with 5 spreading veined ovate sepals; petals 10-12, narrowly linear, not prominent but surpassing the stamens. Siberia.—Listed, but apparently little known horticulturally.

6. *chinensis*, Bunge (*T. sinensis*, Hort.?). Long regarded as a form of *T. asiaticus*, but now separated: stout striate glabrous herb: radical lvs. obsolete; lower st.-lvs. reniform and the upper orbicular-reniform, sometimes 7 in. across, palmately 5-parted, the segms. broad-oblongate: sepals 12 or 13, the outer ones broad-ovate and obtuse, the inner ones rather longer and narrower; petals 20, linear, over 1 in. long, exceeding the glabrous stamens. N. China. B.M. 8565.—

3853. *Trollius europæus* ($\times \frac{1}{2}$).

In English gardens this species is said to thrive well and to seed freely when grown in the bog-garden or beside water.

7. *japonicus*, Miq. St. low (4-8 in. high), scape-like and 1-fld., the lvs. being radical and involucre: fl. yellow, with 5 or 6 sepals which are 1 in. or less long. Japan.—Sometimes combined with *T. chinensis*; apparently closely allied to *T. laxus*. Franchet & Savatier, in Flora of Japan, maintain the species as distinct.

BB. Petals about equaling the stamens in length (or somewhat shorter in No. 10 var.), and shorter than the sepals.

8. *pátulus*, Salisb. Low, 1 ft. or less high: radical lvs. palmately dissected, the segms. incised-dentate: fl. golden yellow; sepals usually 5, sometimes 6 or 7, ovate and spreading; petals and stamens nearly equal, the former 1-5; style erect and about equaling the ovary. Caucasia to Persia.—Finet & Gagnepain define this species very broadly, to include others. They make var.

genuina, Fin. & Gagn. to include *T. laxus*, Salisb., *T. pumilus*, Don, and *T. pumilus* var. *yunnanensis*, Franch.; also var. *Lédebouri*, Fin. & Gagn. (*T. Lédebouri*, Reicheb. f.), differing from the type in having the sepals longer than the stamens.

9. *caucasicus*, Stev. (*T. patulus* var. *caucasicus*, Huth). Radical lvs. palmately dissected, the segms. incised-dentate: sepals 5-8, elliptic, spreading; petals 10, about equaling the stamens; style about equaling the ovary. Caucasasia, Armenia, etc.—Perhaps a form of *T. patulus*, as considered by Huth. Under the name *T. caucasicus*, the plant offered abroad is described as a hardy perennial, with large orange fls. in June and July; 2-3 ft. In horticultural literature the fls. are usually described as globular, which raises a question as to the identity of the cult. plant.

10. *pumilus*, Don. St. 1 ft. or less high, from a horizontal rootstock, the base bearing old lvs., with few lvs. on the st. and those above the middle: lvs. small, 1-2 in. diam., orbicular, thickish, 5-parted, the segms. broadly obovate and 3-lobed: fls. 1 in. across, solitary, yellow; sepals 5 or 6, rounded, notched at the end; petals 10-12, about equaling the stamens, cuneate-oblong: follicles many. Alpine Himalaya.

Var. *yunnanensis*, Franch. St. to 2 ft. high and sometimes 3-fld.: lvs. narrowly dentate, the teeth short and rigidly mucronate; cauline lvs. 1 or 2: sepals 6-8, broadly ovate or suborbicular; petals long-clawed, shorter than stamens. W. China.—Described as horticulturally not unlike *Caltha palustris*, but superior, with dark green lvs. and bright golden yellow salverform fls.

BBB. *Petals shorter than the stamens and scarcely equaling the filaments, and shorter than the sepals.*

11. *laxus*, Salisb. (*T. americanus*, Muhl.). Sts. slender, weak, $\frac{1}{2}$ -2 ft. long, somewhat ascending: radical and lower st.-lvs. long- or short-petioled; all the lvs. 5-7-parted; lfts. cuneate and much cleft and toothed: fls. usually solitary, 1-2 in. across; sepals 5-7, entire or toothed at the end, more spreading than the other species; petals many, much shorter than the stamens: follicles $\frac{1}{4}$ in. long, straight beak one-fourth as long: head of fr. $\frac{3}{4}$ in. across. Bogs and damp places, Mich., to New England and Del. and westward. May-July or Aug. B.M. 1988 and L.B.C.:56 (both as *T. americanus*).

Var. *albiflorus*, Gray (*T. albiflorus*, Rydbg.). Much like the type but usually lower, more slender: lfts. usually 5: fls. pale or white; petals nearly equaling the stamens. Mountain tops, Colo., northward and westward.

12. *acaulis*, Lindl. Plant only 3-4 in. high: lvs. as in the above, or only 5-parted: fls. lemon-yellow, spreading, on sts. hardly reaching from the ground; sepals 9, nearly lanceolate, acute, sometimes toothed; petals spatulate, shorter than the stamens. N. India. B.R. 29:32.

T. aurantiacus, Hort., described as lemon-yellow: probably a form of *T. europæus*.—*T. Excelsior*, Hort., and *T. hybridus*, Hort., with deep orange fls., are probably *T. europæus* forms.

K. C. DAVIS.

L. H. B.†

TROPÆOLUM (from Greek word for *trophy*; the leaves are shield-shaped and the flowers helmet-shaped). *Tropæolaceæ*. NASTURTIUM of gardens (but not of botanists). Climbing or rarely diffuse soft-growing herbs, grown in the garden for their showy flowers.

Roots fusiform, sometimes tuberous: lvs. alternate, peltate or palmately angulate, lobed or dissected; stipules none or rarely minute, bristle-like or dissected: peduncles axillary, 1-fld.: fls. irregular, usually orange or yellow, rarely purple or blue, but the garden forms now show a great range of color; sepals 5, connate at their base, posterior produced into a long slender spur;

petals 5 or fewer by abortion, usually narrowed into distinct claws, two upper smaller or dissimilar and inserted in the mouth of the spur; stamens 8, free, unequal, with declined usually curving filaments; ovary 3-lobed, 3-celled, ripening into 3 1-seeded indehiscent carpels (these constitute the "seed" of commerce).—About 45 species, S. Amer., chiefly from the cooler parts of Peru and Chile. Monographed in 1902 by Buchenau in Engler's *Pflanzenreich* hft. 10 (IV. 131).

The common species, *T. minus* and *T. majus*, are also grown for their young pods and seeds, which are made into pickles. The peppery-tasting leaves are sometimes used like cress, in salads, whence the name "Indian cress" in England. In America this use of the plant is little known. Certain kinds, particularly *T. tuberosum*, produce edible subterranean tubers.

Tropæolums thrive in any warm sunny fairly moist place. The tops are tender to frost. For early effects, seeds may be started indoors in pots or boxes. The common climbing species are *T. majus* and *T. peltophorum*, both of which are very useful for window-boxes, balconies, for covering banks and walls, and for growing amongst shrubbery. The common dwarf species, *T. minus*, is earlier and usually more floriferous, and is very useful for the front row in the border. On rich soils, nasturtiums produce very heavy foliage that overtops the bloom. *T. peregrinum*, the canary-bird flower, is grown either indoors or in the open. Probably most species are perennial. Many of them are tuberous and withstand some frost at the root; but the half-hardy species are little known in this country.

3854. Flower of *Tropæolum minus*. One of the lower petals shown at a. ($\times \frac{1}{2}$)

A. *Species annual or perennial but not tuber-bearing.*

B. *Petals 5, entire or rarely rarely emarginate or crenate at the apex.*

C. *Inferior petals not ciliate at the base.*

D. *Plants perennial, low, prostrate, glabrous.*

1. *polyphyllum*, Cav. Perennial, half-hardy: st. succulent, prostrate or climbing: lvs. peltate, orbicular, cut beyond the center into 7-9 narrow divisions: fls. much like *T. majus* in shape, but smaller; spur slender but rather short, the calyx-lobes triangular; petals obovate-cuneate, unguiculate, yellow, wavy or emarginate, the 2 upper ones streaked with red. Chile. B.M. 4042. P.M. 10:175. F.S. 20:2066. G.C. II. 20:241. Gn. 45, p. 158. G.M. 58:367. St. naturally prostrate.—*T. Leichtlinii*, Hort. Garden hybrid between *T. polyphyllum* and *T. leptophyllum* (see suppl. list), raised by Max Leichtlin, of Baden-Baden. More closely approaching the former, but with larger lvs., more

numerous and more vivid-colored fls. and said to be more hardy.

DD. Plants perennial, tall, scandent.

2. *speciosum*, Poepp. & Endl. Half-hardy slender climbing vine: lvs. peltate at the base, short-petioled, parted to the base into 6 obovate-oblong obtuse divisions or lfts.: pedicels very slender, red, fls. shaped much like those of *T. majus*, but smaller, vermilion-red, showy, upper cuneate, lower almost quadrate. Chile. B.M. 4323. F.S. 3:281. P.M. 14:173. Gn. 37, pp. 253, 545; 61, p. 274; 79, p. 68. R.H. 1904:88.—A perennial fleshy-rooted plant, hardy in England.

3855. *Tropaeolum majus*, the common climbing nasturtium. ($\times \frac{1}{4}$)

nearly orbicular, undulate and with points on the margin: fls. large, long-spurred, orange-red, the 2 upper petals large, rotundate, broad and entire, the 3 lower ones small and clawed and coarsely toothed and also fringed on the claws. Colombia. B.M. 4097. F.S. 2:67. P.M. 11:271. Gn.M. 9:16. Var. *fimbriatum*, Hubb. (*T. Lobbianum* var. *fimbriatum*, Hort.), has all the petals toothed or fringed. R.H. 1856:101. Seldom seen in its pure state. Var. *hederifolium*, Hubb. (*T. Lobbianum* var. *hederifolium*, Hort.), has variegated lvs. which resemble those of *Hedera helix* in shape. Var. *miniatum*, Hubb. (*T. Lobbianum* var. *miniatum*, Hort.), is said by some to be a hybrid with bright vermilion fls. Var. *Regina*, Hubb. (*T. Lobbianum* var. *Regina*, Hort.), is a form with bright salmon-red or salmon-orange fls. There is a horticultural strain of more compact growth known as *T. Lobbianum compactum*; this strain occurs in numerous colors. Horticultural color-forms listed under the name *T. Lobbianum* are *atropurpureum*, dark purple; *aureum*, clear golden yellow; *fulgens*, dark scarlet; *Chazianum*, yellow, washed with red.

DD. Plant glabrous.

E. Lvs. orbicular-reniform; nerves terminating in mucrons: petals mucronate.

4. *minus*, Linn. Fig. 3854. Dwarf annual, not climbing, smaller in all its parts than *T. majus*: lvs. orbicular-reniform, apiculate at the ends of the veins: petals narrow and apiculate at the apex, the lower intensely maculate. Peru. B.M. 98.—Very likely blended with *T. majus* by hybridization, in garden forms. *T. pinnatum*, Andr., is either a monstrosity of this species or more probably a hybrid between *T. minus* and *T. peregrinum*, having the lvs. somewhat peltate,

with obtuse, unequal lobes: fls. pinnate; petals cuneate with the apex dentate. A garden form. Gt. 62, p. 279. The form known as *bimaculatum*, Hort., has red petioles and peduncles and the 2 upper petals bear a dark blood-red blotch. There is also a yellow form known as *luteum*, Hort.

EE. Lvs. orbicular; nerves and petals muticous (blunt).

5. *majus*, Linn. Fig. 3855. Strong-growing somewhat succulent climbing annual: lvs. peltate, nearly orbicular and undulate-angled: fls. large, mostly in shades of yellow or orange, with straight spur, the 2 upper petals entire or undulate (not apiculate), the 3 lower ones narrower and fringed on the claws. Peru, Colombia, and Brazil. G. 4: 2. B.M. 23; 3375 (var. *atrosanguineum*). F.S. 12:1286 (var. *atropurpureum nanum*). P.M. 1:176 (var. *atrosanguineum*). G.C. II. 11:665.—This species has been in cult. in Eu. since 1684. It is the foundation of the common climbing nasturtiums. Some of these garden forms are probably the offspring of hybridization with *T. peltophorum*. Some of the horticultural color forms are *atropurpureum*, dark red; *atropurpureum foliis-aureis*, with golden yellow lvs.; *coccineum*, scarlet and the form of it with golden lvs. known as *coccineum foliis-aureis*; *Heinemannii*, chocolate; *hemisphaericum*, light yellow; *luteum*, yellow; *Regelianum*, purple-violet; *Scheuerianum*, straw-colored, dotted; *Scheuerianum coccineum*, scarlet, striped; *Schillingii*, yellow, brown-spotted; *Schulzii*, scarlet, with dark lvs. Var. *flore-pleno*, Hort., is a strain with double fls. occurring in different colors. Var. *nanum*, Hort. TOM THUMB NASTURTIUMS. A dwarf strain occurring in numerous color-forms, some of which are *atrococcineum*, brilliant scarlet; *atropurpureum*, dark purplish red; *atrosanguineum*, a deep blood-red; *coccineum*, scarlet and also the golden-ld. form offered as *nanum coccineum foliis-aureis*; *ceruleo-roseum*, dark rose; *luteum*, clear yellow; *Regelianum*, purple-violet.

BB. Petals 5, serrate-ciliate, lobed or aristate-ciliate above.

6. *peregrinum*, Linn. (*T. canariense*, Hort.). CANARY-BIRD FLOWER. Fig. 3856. Annual, tall-climbing; gla-

3856. *Tropaeolum peregrinum*, the canary-bird flower. ($\times \frac{1}{4}$)

brous: lvs. peltate near the margin, cordate-orbicular, divided to about the middle into 5 lobes, which are mostly apiculate; fls. canary-yellow, odd and very irregular; spur green, hooked; 2 upper petals erect and large, obovate-clawed, much fringed; 3 lower petals small and narrow and ciliate. Supposed to be native of Peru and Ecuador. B.M. 1351. B.R. 718. G.W. 10, p. 497.—An excellent quick-growing vine, although the fls. can scarcely be called showy.

AA. *Species tuber-bearing.*

B. *Tuber large, obconical or pear-shaped.*

7. **tuberdsum**, Ruiz & Pav. Root producing a pyriform irregular tuber 2-3 in. long; st. climbing, glabrous; lvs. peltate near the base, cordate-orbicular, 5-lobed nearly or quite to the middle; fls. rather small, the calyx and long spur red, the petals yellow, small and nearly erect and little exceeding the calyx. Peru and Bolivia. B.M. 3714. F.S. 5:452. P.M. 5:49. R.H. 1853:341 (tubers). J.H. III. 30:385. H.U. 1, p. 4.—Plant stands some frost. In Peru, the tubers are eaten, and the plant is sometimes cult. in Eu. for the tubers. It appears in the American catalogues of European dealers. The tubers are usually boiled, or said to be eaten in a partially dried condition.

BB. *Tuber longer, moniliform in many members: lvs. in 5 parts, usually divided to the base: petals scarlet.*

8. **pentaphyllum**, Lam. Slender climber, the glabrous colored sts. arising from a tuberous root: lvs. divided to the base into 5 oblong or obovate segms. or lfts.: fls. small (about 1½ in. long), the large red spur being the conspicuous part, the lobes green, and the 2 small petals red. Argentina. B.M. 3190. B.H. 22:73.—A half-hardy species, showy because of the great number of bright small fls.

BBB. *Tuber small, sphaeroid or somewhat flattened, rarely elongated: lvs. smaller or small, divided to the base.*

C. *Throat of the spur ventricose-turbinate, aperture narrow; spur cone-like, its tip cylindrical-subulate; petals lemon-yellow.*

9. **tricolor**, Sweet, emended by Lindl. (Sweet spelled the specific name *tricolorum*, but, as Lindley pointed out, this is orthographically incorrect) (*T. cocctneum*, Miers). Fig. 3857. Perennial from a fleshy or tuberous root, half-hardy, climbing: lvs. peltate, orbicular, divided into 6 oblong villous lfts.: fls. about 1 in. long, somewhat cornucopia-shaped, the calyx being the conspicuous part; main part of the calyx vermilion, the short lobes purplish, the small petals yellow. Chile. B.M. 3169. B.R. 1935. F.S. 4:369. P.M. 2:123. Gt. 62, p. 273. G.W. 6, p. 277.—Very choice half-hardy plant and probably the best known in this country of the tuberous-rooted kinds. Usually grown indoors. Its growth is very delicate. Var. **grandiflorum**, Hort. (*T. Jaráttii*, Paxt. *T. Yáráttii*, Buchen.), differs only in having larger fls. P.M. 5:29.

CC. *Throat of spur open; spur short or very short, conical; throat of corolla narrow, almost closed when old; petals blue.*

10. **azüreum**, Miers (*T. violæflorum*, Dietr.). Very slender glasshouse climber: lvs. peltate, 5-parted, nearly or quite to the base, into narrow-obovate or oblanceolate divisions: fls. small, the calyx and short spur green, the wide-spreading corolla azure-blue, the petals 2-lobed or emarginate. Chile. B.R. 28:65. R.H.

1843:300. F.S. 2:110. P.M. 9:247. R.B. 20:157. Var. **grandiflorum**, Hort., has larger fls. F.S. 11:1160. I.H. 3:85.

ccc. *Throat of spur conical, aperture broad; throat of corolla broad, open; petals yellow.*

11. **brachýceras**, Hook. & Arn. A very slender climber, resembling *T. tricolor* in habit: lvs. peltate, nearly orbicular, deeply parted into 6 or 7 oblong or obovate obtuse lobes: fls. small, on short pedicels, the calyx green and very short-spurred, the corolla with spreading yellow petals. Chile. B.M. 3851. B.R. 1926. F.S. 4:368. P.M. 4:55.—Half-hardy perennial.

T. digitatum, Karst. Climber, with root fibrous: lvs. peltate 5-7-lobed: fls. yellow, 1 in. diam., the spur long and red, the petals fimbriate. Venezuela.—*T. leptophyllum*, Don (*T. edule*, Paxt.). Climber: lvs. orbicular, with 5 or 6 narrow lfts.: fls. in shape like those of *T. majus* but smaller, yellow. Produces tuberous edible roots. Chile. P.M. 9:127.—*T. Ländeni*, Wallis. Beautiful climber with large, peltate, undulate-lobed lvs. that are purplish beneath and beautifully veined with white above: fls. on long pedicels, the long tube red and the calyx-lobes green. Colombia. I.H. 41:17.

L. H. B.

F. TRACY HUBBARD.†

TRÓXIMON (Greek, *edible*, which does not apply).

Compósitæ. Mostly perennial nearly stemless herbs, belonging to the Cichoriaceæ, with clusters of sessile radical lvs. and simple scapes bearing a head of yellow or purple fls. in summer, on a naked or bracted stalk: involucre campanulate, the bracts in several rows: rays blunt and 5-toothed at the apex.—Species 30, in N. Amer., except possibly 2 species which are S. American. The plants are little known to horticulturists. The name Troximon is now given up for Agoseris (Greek, *goat chicory*).

Agóseris cuspidata, Dietr.

(*Troximon cuspidatum*, Pursh. *Nothocalais cuspidata*, Greene).

Root thick: lvs. entire, linear-lanceolate, thickish, 4-10 in. long, the margins conspicuously white-woolly and crisped: scape about 1 ft. high: fls. yellow, about 1-1½ in. wide: achene not beaked. Prairies of Ill. and Wis. to N. D.—Cult. easy in

any good border. Not unattractive. It has rather large dandelion-like heads of fls. in late summer. May be offered by collectors.

N. TAYLOR.†

TRUMPET-CREEPER: *Campsis*, especially *C. radicans*. **T-Flower**: *Bignonia capreolata*. **T-Honeysuckle**: *Lonicera sempervirens* and *Campsis radicans*. **T-Vine**: *Campsis radicans*.

TSUGA (its Japanese name). **Pinóceæ**. **HEMLOCK SPRUCE**. **HEMLOCK**. Ornamental trees, grown chiefly for their graceful habit and handsome evergreen foliage.

Resinous trees with slender horizontal branches: lvs. usually 2-ranked, short-petioled, linear, flat or angular, falling away in drying: staminate aments axillary, subglobose; ovule-bearing aments terminal, the scales about as long as the bracts, each with 2 ovules at the base: cones small, ovate, or oblong with thin flexible persistent scales, much longer than the bracts; seeds winged.—Nine or 10 species in N. Amer., E. Asia, and the Himalayas. The genus is closely allied to *Abies* and *Picea* and differs little in the structure of the fls.; the cones are very similar to those of the larch, but the lvs., which are much like those of *Abies* in their outward appearance, though smaller, are very different in their internal structure from all allied genera, having a soli-

tary resin-duct situated in the middle of the lf. below the fibro-vascular bundle. The light, soft, brittle and coarse-grained wood is not durable and not much valued except that of *T. heterophylla*, which is harder and more durable, and that of *T. Sieboldii*, which is esteemed in Japan for its durability. The bark is rich in tannin and that of *T. canadensis* is extensively used for tanning

3858. *Tsuga Sieboldii*. ($\times \frac{1}{2}$)

leather. *T. canadensis* should be called "hemlock spruce," but in common speech it is usually alluded to as "hemlock." The "hemlock" of the ancients is a poisonous umbelliferous herb described in this work as *Conium maculatum*.

The hemlock spruces are evergreen trees of pyramidal habit, with spreading irregularly whorled much ramified branches clothed with small linear usually two-ranked leaves and small cones which are usually freely produced. The cones are only about 1 inch long except in one species, which has cones two or three times as large. *T. canadensis* is quite hardy North and the Japanese species and *T. caroliniana* have proved hardy as far north as Ontario. *T. Mertensiana* is almost as hardy. *T. heterophylla* is tenderer. There are probably no more beautiful hardy conifers than the hemlocks, and they must be ranked among the most ornamental and useful trees for park planting. They do not have the stiff formal appearance of many of the conifers, but are graceful and stately at the same time. *T. heterophylla* is the most vigorous species and is more graceful than the Canadian hemlock, but tenderer. *T. Mertensiana* is noticeable for its light bluish green foliage and the more narrow pyramidal habit. *T. Sieboldii* is a very handsome species with dark green glossy foliage, but of slow growth and in cultivation usually remains shrubby. *T. canadensis* bears pruning well and is well suited for tall hedges (see Gng. 2:289. Gn. M. 2:15; 4:19). The other species will probably bear pruning equally well. The hemlocks are not very particular as to the soil, provided it contains a sufficient amount of constant moisture. Tsugas are not difficult to transplant. Propagation is by seeds sown in spring and by grafting on *T. canadensis*. The varieties and the Japanese species are also raised from cuttings. See also *Arbiculture*, *Abies*, and *Picea* for cultivation.

KEY TO THE SPECIES.

- A. Lvs. with 2 white lines beneath, grooved above, much flattened, distinctly 2-ranked: cones $\frac{1}{2}$ - $1\frac{1}{2}$ in. long.

- B. Margin of lvs. entire; apex of lvs. usually emarginate, sometimes obtuse.
 C. Scales of cones suborbicular.
 D. Branchlets yellowish brown, glabrous..... 1. *Sieboldii*
 DD. Branchlets reddish brown, pubescent..... 2. *diversifolia*
 CC. Scales of cones oblong: lvs. often obtuse..... 3. *caroliniana*
 BB. Margin of lvs. finely denticulate, at least toward the apex; apex of lvs. obtuse or acutish.
 C. Cones peduncled; scales almost orbicular, glabrous..... 4. *canadensis*
 CC. Cones sessile; scales oval, slightly puberulous outside..... 5. *heterophylla*
 AA. Lvs. stomatiferous on both sides, flat or convex above, spirally arranged: cones 2-3 in. long (*Hesperopeuce*)..... 6. *Mertensiana*

1. *Sieboldii*, Carr. (*T. Araragi*, Koehne). Fig. 3858. Tree, attaining 100 ft., with spreading slender branches: branchlets pale yellowish brown, somewhat glossy, glabrous, with reddish lf.-cushions: lvs. linear, usually broadest at the apex, emarginate, grooved and glossy dark green above, with 2 whitish lines beneath, $\frac{1}{4}$ - $\frac{3}{4}$ in. long: cone ovate, 1- $1\frac{1}{4}$ in. long, the peduncle exceeding the bud-scales: bracts bifid. Japan. G.F. 10:492 (adapted in Fig. 3858). F.E. 32:1301. S.I.F. 2:4.

2. *diversifolia*, Mast. (*Abies diversifolia*, Maxim. *T. Sieboldii nana*, Carr.). Fig. 3859. Tree, very similar to the preceding, but smaller and chiefly distinguished by the reddish brown pubescent branches: lvs. linear, emarginate or obtuse, shorter and narrower, broadest at the middle or toward the base: cone smaller, $\frac{1}{2}$ - $\frac{3}{4}$ in. long: peduncle not exceeding the bud-scales; bracts truncate, crenulate, not or slightly bifid. Japan. G.F. 6:495; 10:493 (adapted in Fig. 3859). S.I.F. 2:4.

3. *caroliniana*, Engelm. CAROLINA HEMLOCK. Tree, attaining 70 ft., of more compact habit and with darker green foliage than the following: young branchlets light reddish brown, finely pubescent or almost glabrous: lvs. linear, obtuse or emarginate, dark green and glossy above, with 2 whitish lines beneath, $\frac{1}{2}$ - $\frac{3}{4}$ in. long: cones oblong, 1- $1\frac{1}{2}$ in. long, peduncled; scales oblong. Va. to S.C. S.S. 10:604. G.C. II. 26:780. G.F. 2:269. Gn.M. 12:214.—More graceful than the following.

4. *canadensis*, Carr. (*Abies canadensis*, Michx.). COMMON HEMLOCK. Fig. 3860. Tree, attaining 70 and

3859. *Tsuga diversifolia*. ($\times \frac{1}{2}$)

occasionally 100 ft.: young branchlets yellowish brown, pubescent: lvs. linear, obtuse or acutish, dark green and obscurely grooved above, with 2 whitish lines beneath, $\frac{1}{4}$ - $\frac{3}{4}$ in. long: cones ovoid, $\frac{1}{2}$ - $\frac{3}{4}$ in. long, peduncled; scales almost orbicular. New Bruns. and Wis., south to Ala. S.S. 10:603. G.C. III. 48:350. Gn.M. 12:215. J.H. III. 66:467. G.W. 1, p. 359; 5, p. 536; 9, p. 213.—The hemlock spruce yields the lumber

most commonly used in the E. for framing and clapping of buildings. It is not used for finishing lumber. A number of garden forms have been raised; the following are the most important: Var. *álbo-spica*, Nichols. Tips of the young branchlets creamy white. Var. *compácta*, Sénécl. (var. *compácta nána*, Beissn.). Dwarf conical pyramid with numerous short branchlets clothed with small lvs. Var. *globósa*, Beissn. (var. *globuláris erecta*, Kunkler). Dense, globose, much-branched form with numerous upright branches nodding at the ends. Var. *grácilis*, Gord. (var. *microphýlla*, Hort.). Slow-growing form with slender sparingly ramified branches, spreading and more or less drooping at the ends: lvs. very small, about $\frac{1}{4}$ in. long. Var. *nána*, Carr. Dwarf and depressed form with spreading branches and short branchlets. Var. *parvifolia*, Veitch. Lvs. very small, $\frac{1}{4}$ in. long or shorter: branchlets stout, closely set and numerous. Var. *péndula*, Parsons (var. *Sárgentii péndula*, Hort., var. *Sárgentiána*, Kent). Flat-topped form with spreading branches and drooping branchlets. Gn. 32, p. 363; 39, p. 81. M.D.G. 1900:367, 368, 491. Very distinct and desirable form.

5. *heterophýlla*, Sarg. (*T. Albertiána*, Sénécl. *T. Mertensiána*, Carr.). Tree, attaining 200 ft., with short slender, usually pendulous branches forming a rather narrow pyramidal head in older, but rather broad in young trees: young branchlets pale yellowish brown, pubescent: lvs. linear, obtuse or acutish, distinctly grooved and dark green above, with 2 white lines below, $\frac{1}{2}$ – $\frac{3}{4}$ in. long: cones oblong-ovoid, sessile, $\frac{3}{4}$ –1 in. long; scales oval, slightly puberulous outside. Alaska to Calif., west to Mont. S.S. 10:605. G.C. III. 12:11. Var. *argéteo-variegata*, Schneid. Tips of the young branchlets white.

6. *Mertensiána*, Sarg., not Carr. (*T. Pattoniána*, Sénécl. *T. Hookeriána*, Carr. *T. Roëzii*, Carr. *Abies Williamsonii*, Newb. *Hesperopeuce Pattoniána*, Lemm.). Fig. 3861. Tree, attaining 100 and occasionally 150 ft., with slender pendent branches usually forming an open pyramid: young branchlets light reddish brown, pubescent, usually short and upright: lvs. spirally arranged around the branches, linear, usually curved, acutish, mostly rounded or keeled, rarely slightly grooved above, light bluish green or pale bluish white, with whitish lines on both sides, $\frac{1}{2}$ –1 in. long: cones cylindrical-oblong, usually violet-purple before maturity, brown when ripe, 2–3 in. long; scales obovate, puberulous outside. Brit. Col. to Calif., west to Mont. S. S. 10:606. G.C. III. 12:10; 13:659; 21:150, 151 (adapted in Fig. 3861). G.F. 4:380; 10:6, 7. R. H. 1870, p. 21. Var. *argétea*, Schneid. Foliage bluish white. G.W. 14, p. 602. Var. *Jéffreyi*,

Schneid. (*T. Pattoniána* var. *Jéffreyi*, Henry). Lvs. greenish, flattened and grooved above.—To avoid confusion one has to bear in mind that *T. heterophylla* was known for a long time as *T. Mertensiána* and still bears this name in many gardens.

T. chinénsis, Pritz. Tree, to 120 ft.: branchlets yellowish gray, pubescent: lvs. $\frac{1}{2}$ –1 in. long, rounded or emarginate at the apex, green or nearly so beneath, entire, on young plants sparingly

3860. A spray of hemlock spruce.—*Tsuga canadensis*. (X1)

toothed and with narrow white lines beneath: cones sessile, about 1 in. long, lustrous. Cent. and W. China. G.C. III. 39:236 (cones, as *T. yunnanensis*). Has proved hardy at the Arnold Arboretum and thrives well.—*T. dumosa*, Sarg. (*T. Brunoniana*, Carr.). Tree, to 120 ft.: lvs. gradually tapering from the base, serrulate, acutish, with broad silvery white lines beneath, $\frac{3}{4}$ –1 in. long: cone 1 in. long. Himalayas. G.C. II. 26:73, 501. Tender.—*T. Prétzii* = *Pseudotsuga taxifolia* var. *Frétzii*.—*T. yunnanensis*, Mast. Tree, to 150 ft.: branchlets with rufous-gray pubescence: lvs. rounded at the apex, entire, with white lines beneath, $\frac{1}{2}$ –1 in. long: cones $\frac{3}{4}$ –1 in. long, dull, with fewer scales than *T. chinénsis*. W. China. G.C. III. 39:236 (excl. cones). Growing at the Arnold Arboretum, and apparently quite hardy.

ALFRED REHDER.

TSUSIOPHYLLUM (*Tsusia*, a subdivision of *Rhododendron*, and Greek for leaf). *Ericaceæ*. A low prostrate shrub, native of Japan, resembling small-lvd. rhododendrons of the section *Tsusutsi* (*Tsusia*), like *R. Tschonoskii*, but corolla tubular, regular, smaller, anther-cells dehiscent with a longitudinal slit, ovary 3-celled and the scales of the winter buds dropping from the base. Recently intro. and probably as hardy as *Rhododendron Kaempferi*. Cult. and prop. like other alpine *Ericaceæ*. *T. Tanákæ*, Maxim. Low prostrate shrub with setose branchlets: winter buds with the outer scales longer than the inner ones: lvs. obovate-elliptic, acute and apiculate, setose above, glabrous and glaucous below except the setaceous midrib, $\frac{1}{2}$ – $\frac{1}{2}$ in. long: fls. 1–2, short-stalked, white or pinkish; calyxlobes ovate, obtuse; corolla scarcely $\frac{1}{2}$ in. long, tubular with short roundish spreading lobes, the tube pubescent outside and inside; stamens not exceeding the tube, style shorter than the stamens; ovary paleaceous-setose. Cent. Japan.

ALFRED REHDER.

TUBEROSE: *Polianthes*.

TULBÁGHIA (Tulbagh, a Dutch governor at the Cape of Good Hope, died 1771). *Liliacæ*. Perennial herbs with a short thick woody sometimes corm-like rhizome, usually grown in the greenhouse: lvs. radical, ligulate: scape simple, leafless: fls. in a terminal umbel, numerous, pedicellate; perianth urn-shaped or almost salver-shaped; lobes 6, subequal, spreading; crown rather fleshy at the throat, shorter than the lobes; stamens 6; ovary sessile, ovoid or subglobose, 3-celled: caps. ovoid or oblong, loculicidally dehiscent.—About 20 species, Trop. and S. Afr. Greenhouse subjects, little cult.; prop. by seeds and offsets.

Simmleri, Beauverd. Bulb ovoid: lvs. lorate-lanceolate, rather obtuse: scape much longer than the lvs.: fls. small, rose, segms. ovate-oblong; corona urn-shaped, crenately 3-lobed. Transvaal.

3861. *Tsuga Mertensiána*. (X $\frac{1}{2}$)

TULIP: *Tulipa*. T., Butterfly: *Calochortus*. T., Cape: species of *Hemanthus*. T. Poppy: *Hunnemannia*. T. Tree: *Liriodendron*; also *Hibiscus* (or *Paritium*) *elatus*.

TULIPA (originally from Persian *toliban*, turban; which the inverted flower resembles). *Liliaceae*. **TULIP.** Popular spring-flowering hardy bulbs, and much used for forcing; of easy culture.

Low plants, the fls. mostly single (sometimes 2-5) on a scape or scape-like peduncle that arises directly from the bulb and is 30 in. or less high: bulb tunicated, the outer tunic often hairy or woolly on the inner face: lvs. linear or broad: fls. erect, rarely nodding, showy; perianth deciduous, campanulate or slightly funnel-shaped; segms. distinct, often spotted or blotched at base, without pitted nectaries; stamens 6, hypogynous, shorter than perianth-segms.; filaments longer or shorter than anthers, attenuate or filiform; anthers dehiscing laterally; ovary sometimes narrowed at collar, rarely into a distinct style; stigmas adnate: seeds numerous, flat. Differs from *Fritillaria* in the absence of nectariferous pits and usually erect (never pendulous) fls., and from *Erythronium* in its erect broader perianth-segms., erect fls., and usually 1-fl. sts. Native of Siberia, Turkey, Asia Minor, China, Japan, and Medit. countries of Eu.; the species are particularly abundant in Cent. Asia, in the Bokhara region. The genus includes probably 100 species as usually defined but perhaps reducible to much fewer; the number in cult., outside the collections of specialists and botanic gardens, is very few. For literature, see J. G. Baker, *Journal Linnean Society* xiv. (1875), 275-96; also in *Gardeners' Chronicle*, for 1883 (vols. 19 and 20); Levier, "*Les Tulipes de l'Europe*," 1885; Solms-Laubach on the history of the garden tulips (see his "*Weizen und Tulpe, und deren Geschichte*," Leipzig, 1899); Burbridge, *The Garden*, Sept. 22, 1900.

Tulips are flowers of rich and brilliant colors, and of good "substance." The tulip is the most showy of spring flowers, and the habit and shape of the plant are so formal and definite that it is adapted to the vicinity of buildings, walks, and to parterres. They are also charming subjects for "spotting in" singly and in little clumps among shrubbery and along well-planted borders.

The range of season is great, from the early Duc Van Thols to the Cottage and late Darwins, covering nearly two months. By a judicious selection of seasons and colors, the amateur may have a most satisfactory successional display, one kind blending into the other. The catalogues of plantmen and seedsmen usually contain reliable lists of varieties for the different seasons. They are dwarf, from about a foot high in the early races, to very tall, as much as 2 and 3 feet in some of the Darwins and other month-later races. There are double tulips of good form and many colors; also the Parrot tulips with curiously enlarged and cut or frayed petals and odd color-markings. The graceful chalice-lines of the single tulips are lost in the double and semi-double forms; the doubles, however, make striking mass displays; they are usually somewhat later-blooming than the singles of the same class.

3862. A garden tulip. ($\times \frac{1}{2}$)

The form of the chalice or perianth-cup, the substance of the flower, the shape of the segments, and the color, are marked features in the tulips of the different classes and seasons. The usually cultivated tulips have very broad flower-segments, obtuse or abruptly narrowed and short-pointed, as in Fig. 3862. In the wild, however, are many forms with long-narrowed segments, as shown in Fig. 3863 (adapted from *Gardeners' Chronicle*), and these may be seen sometimes in the gardens of amateurs; they are very interesting and often showy. It appears that in earlier times the sharp-pointed flower-parts were desired. Other tulip forms are represented in Figs. 3864 and 3865, as well as in the succeeding pictures accompanying this article.

The colors of tulips cover a wide range except that there are no real blues. There are clear whites, yellows and orange, crimson and reds, violets and purples, and many vari-colored types. The tulips known as "breeders" are self-colored kinds; that is, the flowers are of solid colors, usually in dull and neutral shades of red and yellow with tints of bronze, buff, and brown. The reason for the name is this: When tulips are grown from seeds, the flowers at first are usually self-colored; the same bulbs when grown for a few years tend "to break" into mixed colors, particularly into feathered markings: the self-colored state is a breeding-stage for other kinds. When the bulbs are multiplied asexually (as explained farther on), they reproduce the stage in which they then are; if propagated in the "breeder" stage, they give self-colored flowers; if in the "broken" stage, they give parti-colored flowers. These stages are longer or shorter in different lots of seedlings, and are not definite epochs. The "broken" tulips are of many kinds. Those with white ground or under-color and lilac or purple markings are "bybloemen" or "bybloems," and those with yellow ground-color and red to brown over-color are "bizarres." The terms "bybloom" and "bizarre" are also sometimes applied to selfs, or breeders, when the colors are pre-vaillingly lilac or purple in the one case or pre-vaillingly yellow in the other. Selected strains of breeder tulips, with very large bloom, long stems, and "art colors" are now popular. The so-called "rectified" tulips are

broken breeders with solid colors in stripes, flames, plumes, and patches; they are bybloemen and bizarres. It is said that the "breaking" is facilitated by certain soils.

There are many classes of tulips. We might distinguish three roughly: (1) The early single tulips of the Duc Van Thol kind, of small stature, excellent for first bloom and for early bedding, being out of the way for other bedding plants; they lack the size of bloom and the "substance" of later kinds. There are also later-flowering single tulips of the early class. (2) Later-flowering or Cottage tulips, comprising the main-season kinds that have been preserved by cottagers in the old countries since the collapse of the tulipomania of Holland. (3) The Darwins are stately plants, mostly selfs or "breeders," closing the tulip season, with very rich and deep colors in crimsons, reds and purples; there are

3863. A tulip with acuminate flower parts.

some whites but no yellows. This Darwin race is relatively recent, having been given its present name (in compliment to Charles Darwin) little more than twenty-five years ago. Broken rectified Darwins in several color combinations are known as Rembrandt tulips.

There are many other classes or subclasses, and races of intermediate season, that need not be mentioned here.

Vari-colored garden tulips are classified by F. D. Horner (England) into six main sections or classes, and the self-colored or "breeder" strains into three classes, as follows: "(1) *Flamed Bizarres*. These have a yellow ground flamed with red, very dark, almost black, and chestnut-brown. (2) *Feathered Bizarres*. These have similar colors, but the yellow grounds are marked or penciled on the margin, whereas the flamed flowers have a heavy 'beam' of color in the center of the petals. (3) *Flamed Bybloemens*. These have a white ground marked with lilac, purple, and very deep black-purple color. (4) *Feathered Bybloems*. Similar in color, but with feathered instead of flamed petals. (5) *Flamed Roses*. These are flamed with rose and scarlet colors on the pure white ground. (6) *Feathered Roses*. These have a white ground, and are flamed with rose and scarlet colors. There are three more classes of what are termed 'breeders,' *Bizarres*. Yellow selfs. *Bybloemens*. Lilac and light to deepest purple selfs. *Roses*. Rose and scarlet selfs. They are termed 'breeders' because in the course of a few years these self-colored flowers become flamed or feathered, and pass out of the breeder state."

3864. The common contemporaneous garden tulip.

The common garden tulips, in their many forms, are probably all developments of the *Gesneriana* group, comprising *T. Gesneriana*, *T. suaveolens*, and the like. Many of the forms sometimes catalogued as "botanical tulips" are also very ornamental and are always interesting in a collection. A number of species may be had in the trade. They should be better known.

Tulip history (Stubenrauch).

The tulip has an unusual and interesting history, on which we may pause briefly.

The origin of the garden tulip seems to be lost beyond recovery. It is often said that it is derived from *Tulipa Gesneriana*, but this does not explain. It merely means that in 1753 Linnæus grouped all the garden tulips he knew under the name of *Tulipa Gesneriana*. But the tulips of that day had been cultivated for two centuries by Europeans, and previously for an indefinite period by the Turks, from whom, of course, we have no exact records. (Fig. 3866.) One might study wild tulips in their native places and compare them with descriptions without being certain of the original form which the Turks brought from the wild, simply because of the lack of records at the beginning. It is necessary to have some scientific name for the garden tulips. The most one dare say is that the garden tulips are chiefly referable to *T. Gesneriana* and *T. suaveolens*, with the distinct understanding that these names do not represent an original wild stock. *Tulipa suaveolens* requires explanation. This name, which dates from 1797, stands for a kind of tulip discovered wild in southern Europe long before that date. There is no proof that it was native; the probability is that it had escaped from gardens and run wild. In 1799, it was distinguished from the other tulips then known by the fragrance of the flowers, the earliness of bloom, slightly greater size and pubescent scape. From the early records it appears that there were fragrant early-blooming flowers among the first tulips received from Turkey. This is one of the main reasons for thinking that *T. suaveolens* is not native to southern Europe. At all events, it is clear that *T. suaveolens* has played an important part in the evolution of the garden tulip, the Duc van Thol class being credited to this source. The distinctions between *T. suaveolens* and *T. Gesneriana* given in the sequel are those of Baker, but they do not hold at the present day. It is impossible to refer any given variety with satisfaction to either type. Some writers have said that the leaves of *T. suaveolens* are shorter and broader than those of *T. Gesneriana*. This character also fails. All grades of pubescence are present. Some pubescent plants have long leaves and odorless flowers. Others have short glabrous leaves and fragrant flowers.

For practical purposes it may be said that most of the common garden tulips, at least the late-flowering ones, are *T. Gesneriana*, while many of the early-flowering kinds, e.g., the Duc van Thol class, are supposed to be derived from *T. suaveolens*. It is impossible to press much nearer the truth, as the prototypes of the old garden favorites cannot be known completely and precisely.

The first tulip seeds planted by Europeans were sent or brought to Vienna in 1554 by Busbequius, the

3865. Acute-petaled style of tulip. ($\times \frac{1}{4}$)

Austrian ambassador before the Sultan of Turkey. Busbequius reported that he first saw the flowers in a garden near Constantinople, and that he had to pay dearly for them. After the introduction of seed to Vienna the tulip became rapidly disseminated over Europe, both by home-grown seed and by new importations from Turkey. In 1559 Gesner first saw the flower at Augsburg, and it is mainly on his descriptions and pictures that the species *T. Gesneriana* was founded. One of the earliest enthusiasts was the herbalist Clusius, who propagated tulips on a rather large scale. A picture from him is shown in Fig. 3866. He did not introduce the tulip into Holland, but the appearance of his specimens in 1591 did much to stimulate the interest in the flower in that country. The best of Clusius' plants were taken from him, as the admirers of the tulip were unwilling to pay the high prices he demanded. After this, the propagation of the tulip proceeded rapidly in Holland and the flower soon became a great favorite. The production of new varieties became a craze throughout the Netherlands, culminating in the celebrated "tulipomania" which began in 1634. The excitement continued for four years, the price of bulbs often being above that of the precious metals. Thirteen thousand florins were paid for a single bulb of *Semper Augustus*; but the dealings were often in the nature of pure speculation, no bulbs changing hands. Governmental interference was necessary in order to end the ruinous speculation. After the craze subsided, the production of varieties continued upon a normal basis, and has persisted throughout the centuries in Holland, making that country the center of the bulb-growing industry of the world down to the present day.

The introduction of the tulip into England is credited to Clusius, about the year 1577. Tulips reigned supreme in English gardens until the beginning of the eighteenth century, when they were neglected by the rich for the many new plants from America. For a time the tulip was considered more or less of a poor man's flower, although it has at no time been without many staunch admirers among the upper classes.

With the Turks the narrow acuminate flower-segments were in favor, while western taste preferred the rounded forms (Fig. 3868). The Turks seem to have been satisfied with a preponderance of the reds and yellows, for in the first sowings of Turkish seeds the larger part of the resulting blooms were of those colors. It thus came about that flowers so colored were considered common and undesirable in the European gardens and all effort was directed to the production of the rarer white-grounded varieties with finely and distinctly marked stripes, those with a sharp bright red being the favorites. Indisputable evidence of this is seen in the old Holland "still-life" paintings of that time, where one finds none but the rarer forms represented (Solms-Laubach). All the early tulips of direct Turkish origin had acute more or less narrow and reflexed segments. Indeed, among all the old engravings, including those of Pena and Lobel (1570), Clusius (1576), Dodoens (1578), and Besler (1613), no round-petaled forms are found. Besler's work, "*Hortus Eystettensis*," contains magnificent copper plates, the first in any book on plants. In some copies the plates are beautifully colored by hand. The fifty-three figures of tulips in this great work show how widely diversified was this flower even at that early date. In this and in Parkinson's "*Paradisus Terrestris*" (1629), many are figured with inner segments rounded and outer acute, but none vice versa (so far as can be seen), although that form is mentioned in the descriptions. The broad, rounded, erect-petaled forms were developed later, apparently first by the Dutch growers before the tulipomania and contemporaneously with it, and produced wholly by selection. This ideal has prevailed down to the present time, for the narrow-petaled varieties are practically unknown

among our common garden forms, so much so that the extreme typical one has been referred to a separate species (*T. acuminata*, Fig. 3872). In the Dutch fields they are now known as "thieves," and are destroyed as soon as they make their appearance. The quest for unusual colors appears to have been one feature of the tulip furor. Dumas' "Black Tulip" is interesting in this connection.

Parrot tulips were known toward the end of the seventeenth century. They were often considered

3866. A sixteenth-century tulip.

From the work of Clusius published in 1576. One of the oldest pictures of tulips. Same size as original plate.

to be monstrosities and were pictured as such. According to Solms-Laubach, no traces of them are to be found in the old Dutch books. They were evidently developed by the French, who did not disdain the yellow and red forms, to which these belong, to such an extent as did the Hollanders. At one time they were made a separate species, *T. turcica*, and were later said by one author to be hybrids, between *T. acuminata* and *T. sylvestris* (E. S. Rand, Jr., 1873), by another between *T. Gesneriana* and *T. suaveolens* (Mrs. Loudon, 1841). That the Parrot tulips are hybrids is perhaps true, but to state with certainty the parents seems impossible, for as early as 1613, among the figures in *Hortus Eystettensis*, there is one which shows laciniation of the petals to a marked degree, sufficiently so, in fact, to be

the original form from which this strain might have been developed. Many of the garden varieties of today exhibit more or less laciniation, so that it is probable that "Parrot" strains might be developed from them by simple selection.

Double tulips seem to have made their appearance at an early date. In "Hortus Eystettensis" (1613), there are four forms figured, one of which, at least, seems to have been almost wholly made up of bracts, as it is shown entirely green and is described as being "wholly herbaceous and green." The other three there figured

3867. A pan of Murillo tulips, one of the few double varieties that are really desirable. ($\times \frac{1}{4}$)

are: one red, one yellow, and the other white with maroon borders. Solms-Laubach places the advent of double tulips at a much later date, 1665, and gives as the first authentic record the account of "*Tulipa lutea centifolia*, le monstre jaune double." Flowers with as many as 200 petals are mentioned. A double form of "*T. serotina*" was known in 1701, and at the beginning of the nineteenth century a double form of *T. sylvestris* was described.

Cultivation of the tulip.

The tulip is one of the easiest plants to grow, but, like other plants, it profits by extra care. In any ordinary soil it gives excellent satisfaction, if good bulbs are secured in the first place.

For outdoor cultivation for spring bloom the bulbs should be set in September to December in the latitude of New York. They should be planted before hard freezing weather comes. The soil should be a sandy loam, well worked to a depth of at least 12 inches for best results, and enriched with leaf-mold and well-rotted cow-manure. Fresh manure of any kind should never be used near bulbs of any sort. On heavier soils tulips can be successfully raised if extra care is given to insure perfect drainage. Drainage is important under all conditions. The bulbs will never prove satisfactory in low wet situations, and if there is danger from standing water it is best to raise the beds several inches above the surrounding ground. The production of large perfect flowers depends on a large supply of fibrous roots. Size of bulbs is not so important: a large bulb cannot offset a deficiency of roots.

Plant the bulbs 4 to 6 inches deep (to the bottom of the bulbs) and 4 to 9 inches apart, depending on the class or size of the plants, the closer distances being for the early single kinds and the wider distances for the later and larger kinds. Care should be exercised to place all the bulbs at the same depth, as otherwise they will not all bloom at the same time. When the ground begins to freeze, cover the beds with leaves, dry forest litter, or other light material. After danger

of heavy frosts is past in spring the beds should be uncovered, and if the work of preparation and planting has been well done the tulips will require little or no further care. In England many of the beds of choice and delicate varieties of tulips are protected when in flower from heavy rains and hot sun by means of light cloth screens, and are thus kept in good condition for some time.

Tulips may remain in the ground several years if the tops are not cut off and if the maturing leaves are not smothered by other plants. In practice, however, the best results are usually not secured in this country after the bulbs have been in the ground two or three years. The Darwin class seems to lack in constitution, and the plants should be renewed every two years or so.

In old-fashioned gardens, tulips often remain year after year; but when the beds are needed for other flowers in succession, the bulbs are lifted as soon as the flowers are past and reset elsewhere until the plants mature and the tops die down naturally. Then the bulbs are taken up, sorted and dried, and stored in a cool dark place until planting-time; or they may be planted at once in the permanent quarters if the area is ready to receive them. Even in borders and among shrubbery, it is well to take up the bulbs every two or three years and sort out the small ones, replanting the remainder; or, if they are weak, to discard all of them for new ones. For the best bedding work, it is advisable to use strong freshly imported stock each year.

To make design-beds, choose bulbs of very uniform size. Dig out the bed, removing all the earth a little deeper than the bulbs are to be planted, then make a thin layer of soft earth on which the bulbs may rest; this surface should be stroked level and be at a uniform depth. Then place the bulbs in the design and fill in around them carefully by hand; then place the earth back in the bed.

For pot culture (winter and spring bloom), a mixture of fine garden loam, two parts to one of well-rotted manure (cow-manure composted for two years is best), mixed with enough clean sand to make the mass easily friable, is most suitable. If no loam is obtainable and a heavier garden soil must be used, one part of the latter will be sufficient, in which case the addition of an equal proportion of leaf-mold will be advantageous. From three to five bulbs, according to size, to a 5-inch pot are effective. Deep pans are often used with good effect; a 6-inch pan may hold five or six early singles, and an 8-inch pan as many as ten (Figs. 3867, 3868). Fill the pots lightly and press the bulbs into the soil, thus bringing the base in close contact with the soil-particles. Cover the bulbs to the tip and press the soil firmly all around. Water once freely and cover the pots entirely with soil, leaves, or litter, so that they will be out of reach of frost, or place them in a dark cold (not freezing) cellar or room until the bulbs have become well rooted, which under ordinary conditions will re-

3868. Round-petaled tulips in a 5-inch pot. ($\times \frac{1}{4}$)

quire five or six weeks. When the pots have become well filled with roots—the more the better—they are ready to be brought into the house. For the first few days at least the temperature should be moderate and even, and the atmosphere not too dry. Water freely but not to excess. Some of the varieties—especially the white thin-petaled ones—are said to resent overwatering very quickly. If raised in living-rooms greater care is necessary, as the atmosphere of such a room is drier than that of a greenhouse. On cold nights the plants should be removed from exposed places where they are liable to freeze, and when the flowers appear they should not be allowed to stand in the direct rays of the sun shining through a window. Many of the handsomest flowers are thus easily burned and wilted. Practically all of the early single varieties are adapted to pot culture, especially the Duc van Thols when well rooted; otherwise they are extremely unsatisfactory. For a succession, pot every week or ten days from September to December or pot early and bring into the house at fortnightly intervals. Avoid caking the soil beneath bulbs. The single early tulips are best for forcing, although some of the Darwins give good results.

Many of the early single varieties are adapted to water-culture. For this purpose use ordinary "hyacinth glasses," and select only well-formed solid perfect bulbs of fair size. Put a little charcoal in the water to keep it pure. The bulbs must be placed so that the base is just in contact with the water—not immersed in it. Place them in a dark closet for ten days or a fortnight until the bulbs have become well rooted, then give them plenty of light and air.

Propagation is effected in various ways. Tulips may be increased by the side offsets, but these are not so constant as new bulbs produced within the outer tunics by means of cutting the old bulbs. Fig. 3869 shows a section of a bulb with new inner bulb and outer offset in place. The new bulb is completely inclosed in a sac which afterward becomes the outer dry membranous tunic. The pubescence, if any, may be found on the inside of this sac, even in the earliest stages of growth. The new bulb is attached to the base of the flower-stem, immediately above the root-crown from which the former proceeds directly upward. Each new bulb-tunic (including the outer sac) is provided with a growing tip, which often extends above ground into a leaf, each one coming up within the other. Fig. 3869 shows the separated leafy bulb-scales, and indicates the homology of tunics and leaves. Sports among the offsets are at present mainly depended on for the production of new varieties. These have been found susceptible to the "breaking" process, though perhaps slower to respond than the seedlings. Seed production is now practised only in exceptional cases. The production of hybridized varieties by crossing the old forms with some of the newly introduced species is likely to come into favor.

Tulips are "Holland bulbs," that is to say, the bulbs are grown mostly in Holland and are extensively shipped to this country. Considerable interest has

been aroused in the growing of commercial bulbs in this country, particularly in the Puget Sound region. The tulip can be grown to perfection in the Pacific Northwest, but the cost of production, on account of the high wage-rate, may be a controlling problem. As the situation looks now, the American can produce fully as good a bulb, and one that will mature earlier than the Holland-grown; but whether the product can be sold in the eastern market in competition with the Dutch is a question yet to be determined. It is probable that the bulbs can be grown as far south as San Francisco. South of San Francisco, the single early tulips bloom very close to the ground; on the other hand, the Darwins seem to do very well in the Santa Cruz and Ventura regions. At the government bulb-farm at Bellingham, Washington, good tulip bulbs with normal increase have been produced under adverse conditions.

3869. Three leafy bulb-scales from young bulb, exhibiting the homology of leaves and bulb-scales ($\times \frac{1}{2}$). At the right an old tulip bulb, showing formation of new bulb within the old, and flower-stem attached directly to root-crown.

KEY TO THE GROUPS.

It is a matter of regret that the key used below is based on technical botanical characters of no interest to the horticulturist, but it seems to be impossible to group the species primarily according to the color and shape of the flowers or other marked external features. It is difficult to determine the cultivated forms botanically. For the most part, the portraits cited in this treatment are under the names that accompany them; the authors can not vouch for all of them.

- Subgenus I. ORITHYA. *Style distinct by the attenuation of the ovary, bearing 3 small stigmas; dwarf, small-fl'd. and fragile plants little known in cult.* Species 1
- Subgenus II. TULIPA proper. *Style lacking, the stigma sessile on the ovary.*
- A. Outer coat or tunic of bulb glabrous or practically so inside. Species 2-4
- AA. Outer bulb-coat or covering variously hairy on inside.
- B. Bulb-tunic always hairy at base inside around root-crown, and usually with a few scattering hairs above but sometimes without them. Species 5-13
- BB. Bulb-tunic with a few appressed hairs inside toward the top. Species 14-23
- BBB. Bulb-tunic with scattering appressed hairs all over inside. Species 24-38
- AAA. Outer coat variously pubescent or woolly inside.
- B. Bulb-tunic pubescent inside, often densely so at apex. Species 39-42
- BB. Bulb-tunic woolly at base inside. Species 43-47
- BBB. Bulb-tunic everywhere woolly inside. Species 48-53

Subgenus I. ORITHYA, small plants with a distinct style.

1. *dasytemon*, Regel (*Orithya dasytemon*, Regel). "Belongs to the Orithya section of the genus, which

includes species that are nearly all of small stature and possess comparatively small fls. It is a charming plant, growing about 6 in. high. The fls. have yellow segms. edged with white. When fully open in sunny weather a group produces a brilliant effect, and it is one of those small bulbous plants that are most appropriate for the rock-garden planted between other low-growing plants. The bulbs may be left undisturbed in the ground; a group planted amongst *Alyssum spinosum* in the rock-garden at Kew flowered quite as freely the second year as the first."—W. I. in G.C. III. 52:206 (with fig.). Baker describes it as st. 1-fl. and not more than 3 or 4 in. long; lvs. 2, glaucous, lanceolate; perianth above 1 in. long, funnel-shaped, bright yellow inside, the outer segms. oblanceolate and green-tinged on outside. E. Turkestan.

Subgenus II. *TULIPA* proper, without distinct style.

A.1. Outer bulb-tunic quite or nearly glabrous inside.

B. Perianth yellow, flushed with green outside..... 2. *fragrans*

BB. Perianth crimson tinged with yellow outside..... 3. *Hageri*

BBB. Perianth vermilion..... 4. *præstans*

2. *fragrans*, Munby. Height 6–12 in.: proper lvs. 3, crowded at middle of st., linear or lorate; fls. yellow, greenish outside; perianth funnelform-campanulate, 1–1½ in. long, 3 in. across, slightly fragrant; segms. all acute; filaments bearded at base; ovary slightly narrowed at collar; stigmas small. Algeria. Gn. 45:486.—Allied to *T. sylvestris*, differing in position of the lvs. and segms. uniformly wide.

3. *Hageri*, Heldr. Height 6 in.: lvs. 4–5, lorate acute, not undulate; fls. chiefly red, about 2 in. across; perianth broad-campanulate, 1½ in., inodorous; segms. acute, red, with a large, green or purple-black basal blotch margined with yellow; stamens purple-black; filaments linear, bearded at base; ovary narrowed at collar; stigmas small. Hills of Parnes range in Attica. B.M. 6242. F. 1877:169. Var. *nitens*, Hort. Wallace. Said to be much finer than the type: fls. 3 in. across, bright orange-red, the outer segms. flushed with gray and bronze, black at base. Asia Minor. Gn. 63, p. 372.

4. *præstans*, Hoog (*T. suaveolens* var. *sylvestris*, Regel). Bulb about 1 in. diam., rounded, with leathery skin which is almost glabrous inside: scape to 18 in., white-hairy, 1- to several-fl. fls. light scarlet-vermilion, the segms. all uniform in shape, pointed: lvs. hairy, rather broad. Bokhara. B.M. 7920. G.C. III. 33:325. Gn. W. 24:317.—Once confused with *T. suaveolens*, but now considered to be clearly distinct, and that species is identified with the Duc van Thol forms.

A2. Outer bulb-tunic always hairy at base inside around root-crown, and usually furnished with a few scattering hairs above but sometimes without them.

B. St. and lvs. pubescent..... 5. *suaveolens*

BB. St. and lvs. glabrous..... 6. *strangulata*

C. Leafy only at base of st.

D. Lvs. lanceolate; fl. yellow..... 7. *australis*

DD. Lvs. linear; fl. yellow..... 8. *primulina*

DDD. Lvs. lorate-lanceolate; fl. greenish..... 9. *viridiflora*

CC. Leafy to middle of st. or above.

D. Perianth uniformly dark scarlet with a bright yellow basal blotch..... 10. *fulgens*

DD. Perianth uniformly with a blackish basal blotch, bordered with bright yellow..... 11. *macrospella*

DDD. Perianth variable, but rarely with a bordered dark basal blotch..... 12. *Gesneriana*
13. *nitida*

5. *suaveolens*, Roth. DUC VAN THOL TULIPS. Height 3–6 in.: lvs. 3–4, mostly at base of st., lowest lorate-lanceolate and broad; perianth campanulate, 1–2½ in. long, erect, fragrant, bright red or yellow or variegated; segms. all acute; filaments glabrous; anthers yellow; ovary prismatic; stigmas very large. S. Rus-

sia and S. Eu., but possibly only a naturalized form of old intro. Turkish garden varieties. F.S. 12:1223. B.M. 839. Var. *plurifolia*, Hort. St. with 2 fls., bright scarlet, rather pointed in form, with black mark at base of each segm.

6. *strangulata*, Reboul. Said by Baker to be very near *T. suaveolens*, but much taller and the segms. furnished at base with a large black blotch: typically red-fl., but with yellow varieties. Italy. B.R. 1990 (as *T. scabriscapa*). Var. *maculata*, Hort., has soft yellowish fls. blackish at base.

7. *australis*, Link. Height 12–18 in.: st. slender: lvs. 2–3, crowded together at lower portion of scape,

3870. A Parrot tulip.—
Tulipa Gesneriana var.
Dracontia. (×½)

channeled; bud nodding; perianth 1½ in. across, funnel-form-campanulate, yellow, outside reddish; segms. oblanceolate-oblong, acute at apex, slightly puberulent; anthers yellow; filaments flattened, bearded at base; ovary narrowed at collar. Savoy, France, Spain, Portugal, and Algeria. Gn. 45:486.

8. *primulina*, Baker. Bulb ovoid, 1 in. diam., the outer coats brown and thinly appressed-hairy inside: st. glabrous, 1-fl., less than 1 ft. long; lvs. 3–6 near base of st., linear and channeled, glabrous: fl. very fragrant, pale primrose-yellow somewhat red-tinged on outside, funnel-shaped, 1½ in. long; segms. oblong-lanceolate and acute, the inner ones hairy at base. Algeria. B.M. 6786.—Closely allied to *T. australis*.

9. *viridiflora*, Hort. Outer bulb-tunic glabrous except around root-crown, where there is a dense fringe: st. glabrous and glaucous: lvs. lorate-lanceolate, undulated, glabrous, glaucous, edges slightly ciliated near base: fl. large, soft green, edged with yellow or white. Gn. 32:514.—Garden form. Bears some resemblance to a Parrot tulip. Var. *præcox*, Hort., is larger, pale green.

10. *fulgens*, Hort. Garden form with beautiful scarlet fls.: height 8–18 in.: lvs. 3, lanceolate or ovate, very wavy; perianth-segms. all oblong-ovate, acute; anthers yellow; pollen yellow; filaments white, flattened, glabrous; ovary prismatic; stigmas small, not wavy.

11. *macrospella*, Baker. A supposed hybrid of unknown origin, *T. Gesneriana* probably being one of its parents. Height 10–18 in.: lvs. 3–4, long and narrow, lowest long-lanceolate, flat, pendent; peduncle wiry; perianth campanulate, slightly funnelform, emitting a heavy sweetish unpleasant odor, bright crimson to cerise or cherry-red, with a distinct nearly black cuneate basal blotch broadly margined with yellow or yellowish white at top; segms. obtuse or outer sometimes acute, outer reflexed, inner erect; filaments dilated, white at base, black, violet or striated above, glabrous; ovary prismatic, creamy white; stigmas same color, large, slightly undulated.

12. *Gesneriana*, Linn. COMMON GARDEN OR LATE TULIPS. Figs. 3862, 3864, 3865, and others. Height 6–24 in.: st. erect: lvs. 3–4 or more, lower lorate-lanceolate or ovate-lanceolate, often undulated, glaucous, pubescence variable; peduncle erect; perianth campanulate, 1–2½ in. long, inodorous, bright red or varicolored, when bright red with only an obscure basal

blotch, which is usually yellow but may be dark or even blackish or mixed, sometimes white; segms. all obovate-oblong, obtuse, broadly rounded at apex, often with a small cusp in the center; filaments glabrous, flattened; ovary prismatic; stigmas large and usually crisped. Origin uncertain. Intro. from the Turkish gardens in 1554. Long since hybridized and cult. out of all semblance to any wild forms. Supposed original form (Baker) in B.M. 6439 (as *T. Schrenki*). Darwin tulips (Fig. 3871) are a strain of long-stemmed late self-colored tulips.

Var. Dracóntia, Baker. **PARROT TULIP**. Fig. 3870. Similar in habit: perianth usually yellow and red striped and spotted; segms. deeply cleft and laciniately dentate. F.S. 21:2211 (as *T. turcica*).

Var. spathuláta, Hort. (*T. spathuláta*, Bertol.). This differs from the type in its larger fls. of a brilliant red color with a large purplish black blotch at the base of each of the segms. Italy.—Probably the largest of the wild tulips.

Var. Strangewaysiana, Hort. Very large brilliant dark scarlet fls., with a handsome dark basal blotch. One of the naturalized tulips found without disposition to vary in fields near Florence, Italy. F. 1881:65.

Var. álbo-oculáta, Krelage. Deep campanulate fl., with a slight sweetish mawkish odor, bright red, with a distinct white basal blotch; inner segms. obtuse, outer acute; filaments white.

13. nítida, Hoog. Bulb ovoid and small, with long neck, the brown coats glabrous inside except a few short hairs at base and top: scape slender and very short (2-3 in. high), glabrous: lvs. 3, linear-lanceolate, falcate and channeled: fl. bell-shaped, $1\frac{1}{2}$ in. long, intense and very brilliant vermilion-scarlet with small well-defined black blotch at base of segms.; inner segms. obovate, outer segms. oval and shorter. Bokhara. G.C. III. 31:351.

A3. Outer bulb-tunic with a few appressed hairs inside toward the top.

B. St. pubescent.

C. Lvs. blotched with linear chestnut-brown spots: filaments not bearded at base......14. *Greigii*

cc. Lvs. not blotched: filaments bearded at base......15. *Eichleri*

BB. St. glabrous (*T. Kolpakowskiana* sometimes obscurely pubescent).

C. Lvs. ovate or broadly lanceolate.

D. Filaments bearded at base......16. *pulchella*

.....17. *violacea*

DD. Filaments not bearded......18. *carinata*

.....19. *vitellina*

CC. Lvs. narrowly lanceolate to linear or linear-lanceolate.

D. Filaments bearded at base......20. *sylvestris*

DD. Filaments not bearded, glabrous. 21. *Ostrowskiana*

22. *Kolpakowskiana*

[skiana]

23. *Sprengeri*

14. Greigii, Regel. Height 2-8 in.: lvs. usually 4, obscurely downy, much undulate toward cartilaginous border: perianth campanulate, 3-3½ in. long, 5 in. across, spreading abruptly from about the middle, bright crimson with a large dark basal blotch margined with yellow; segms. uniform, obovoid, cuspidate or emarginate; anthers yellow; filaments black, glabrous; ovary narrowed at collar; stigmas yellow, twice as broad as neck of ovary, reflexed. Turkestan. B.M. 6177. F.S. 21:2261. F. 1876:217. G.Z. 21:265.—Early-blooming. **Var. álba**, Hort., has segms. white-margined.

15. Eichleri, Regel. Height 6 in.: lvs. 12-15 in. long, lanceolate-acuminate, margins plane and smooth: perianth broadly campanulate, 2½-3½ in. across, deep scarlet with a broad-cuneate dark violet-blue

basal blotch margined with yellow; segms. rounded at top with a mucro; anthers violet-brown; filaments black; stigmas very thick, undulate, pale yellow. Georgia in Asia. B.M. 6191. F. 1877:169.—Allied to *T. Greigii*.

16. pulchélla, Fenzl. Height 4 in.: lvs. 2-3, crowded and spreading close to the surface of the ground, channeled, obscurely ciliate on edges: perianth funnelform, erect, 1-1½ in. long, 2½ in. across, bright mauve-red above, passing downward into a slaty lilac without any dark-colored blotch, but bright yellow at base; segms. all acute, densely pilose at base; filaments linear; ovary clavate; stigmas less than ovary-diam. Alpine regions of Cilician Taurus, 1877. B.M. 6304.—A dwarf species near to *T. Hageri*.

17. violácea, Boiss. & Buhse. Less than 12 in. high: lvs. 3-5, crowded: perianth campanulate with a contracted base, 1½ in. long, 2 in. wide, fragrant, typically bright mauve-red or rosy crimson flushed with purple, varying to white with a slight flush of red outside, with a large brown or black basal blotch, usually bordered with white; segms. uniformly oblong, subacute; stamens black or purple; stigmas small. Persia. Intro. to cult. 1890. B.M. 7440. G.M. 39:390.—Allied to *T. Hageri* and *T. pulchella*.

18. carináta, Hort. Krelage. Lvs. 3, not crowded, as long as fl.-stalk, slightly undulate, lightly ciliate on edge near base: perianth open-campanulate, 3 in. long, dark scarlet, tinged with green just above and blending into a bright yellow basal blotch; segms. acute, cuspidate; stamens yellow; ovary prismatic; stigmas white, not undulated. Habitat unknown. **Vars. rùbra** and *violácea*, Hort., are offered.

19. vitellina, Hort. Lvs. 4, not crowded, as long as fl.-stalk, not undulated, thinly ciliate on edges: peduncle slightly tinged with red near fl.: perianth campanulate, 2 in. long, sulfur-yellow, no basal blotch; inner segms. rounded, outer acute; filaments yellowish white; stigmas not undulated.—Said to be "hybrids between *T. suaveolens* and *T. Gesneriana*." It is one of the "Cottage Garden" tulips, a class of old-fashioned tulips which have been preserved from oblivion in the gardens of the poor. Recently they have been restored to popular favor. Well worth attention.

20. sylvestris, Linn. Height 9-15 in.: lvs. usually 3, at base of scape, channeled, linear-lorate: peduncle sometimes 2-fld. in cult.: bud nodding; perianth funnelform-campanulate, 1½-2 in. long, yellow; segms. all acute, inner narrower; ovary bladder-form (narrowed at collar); stigmas smaller than ovary-diam., yellow. Said to be native in England and widely so in Eu.—In cult. as *T. florentina* and *T. florentina* var. *odorata*.

3871. A Darwin tulip
(X ½). See No. 12.

21. Ostrowskiana, Regel. Outer tunics of the bulb blackish, strigose-pilose at their apex inside: st. 3-lvd., glabrous, 1-fld., 8-10 in. high including the peduncle: lvs. glaucescent, glabrous, immarginate, the lower narrowly lanceolate, strongly undulate, the upper linear-lanceolate to sublinear, shorter than the st.: peduncle glabrous: sepals more or less spreading, elliptic, per-

ceptibly narrowed into a short cusp, purplish brick-red, base marked with a blackish spot, glabrous; filaments glabrous. Turkestan. Gt. 33:1144. B.M. 6710 (as *T. Kolpakowskiana*).

22. *Kolpakowskiana*, Regel. Tunics of the bulb fuscous, strigose-pilose toward the apex inside: sts. 3-lvd., 1-fld.: lvs. erect-spreading or spreading, undulate, obscurely cartilaginous margined, margin smooth or scaberulous, lower lvs. narrowly lanceolate or linear-lanceolate, upper rather linear (sublinear): peduncle glabrous: perianth erect; sepals spreading, elliptic-lanceolate to lanceolate, all acute or rarely rather obtuse, yellow, outer ones very often becoming reddish or greenish dorsally or entirely purple in a variety, apex and base glabrous; stamens glabrous. Turkestan. B.M. 6635 and G.C. III. 27:309 (both as *T. Borszczowii*).—Nearly allied to *T. Gesneriana*, Linn., which differs in the 3-4-lvd. st., the broader immarginate lvs. and in the campanulate-connivent frequently obtuse segms. of the perianth.

23. *Spréngeri*, Baker. Late-flowering: height 10-18 in.: lvs. 4, close together, long, linear-lanceolate, stiff: peduncle wiry, tinged with deep red under fl.: perianth open-campanulate (star-shaped), 2 in. long, bright scarlet with a somewhat dull brown basal blotch margined all around with dull orange-yellow, all blending into one another; segms. all oblong-ovate and cuspidate; filaments reddish brown; ovary reddish; stigmas equal to narrow collar. Hab.(?). Intro. by Dammann & Co., Naples, 1894. Gn. 56:438. Gt. 44:1411. G.M. 49:665. Said to be the latest tulip.

A4. Outer bulb-tunic with scattering appressed hairs all over inside.

B. *St. pubescent* (*T. maculata* finely so and sometimes glabrous; *T. Tubergeniana* not considered).

c. *Perianth usually bright red with a yellow basal blotch*.....24. *elegans*

CG. *Perianth orange-scarlet, vermilion, or red, with a dark brown, purplish, or bluish black basal blotch*.....25. *maculata*

26. *Micheliana*

27. *Tubergen-*

28. *ingens* [iana]

BB. *St. glabrous, or essentially so* (see No. 27).

c. *Lower lvs. linear*.....29. *Maximowiczii*

cc. *Lower lvs. lorate or linear-lanceolate*. 30. *Kesselringii*

ccc. *Lower lvs. lanceolate or broadly so*.

d. *Lvs. very much undulated*.....31. *platystigma*

DD. *Lvs. slightly or not at all undulated*.

E. *Perianth-segms. all rounded or obtuse at top, not ending in point*.....32. *Korolkowii*

EE. *Perianth-segms. (or at least half of them) acute or cuspidate*.

F. *Inner and outer segms. acute or at least short-pointed*.

[iana]

33. *Kaufman-*

34. *Hoogiana*

35. *saxatilis*

FF. *Inner segms. rounded, the outer acute*.....36. *armena*

37. *Billietiana*

38. *Didieri*

24. *élegans*, Hort. Height 12-18 in.: lvs. 3-4, below middle of st., lorate-lanceolate, finely ciliate upon upper face: perianth beautiful scarlet with yellow base, campanulate, 3-3½ in. long; segms. uniform, narrowed gradually to a very acute point; anthers violet; filaments glabrous; stigmas larger than ovary-diam., yellowish.—Known in gardens only. Krelage catalogues a variety as "*Cottage elegans picotée*," which has larger lvs. and white fls. edged with rose, and without basal blotch. Probably a hybrid between *T. acuminata* and *T. suaveolens*, according to Baker.

25. *maculata*, Hort. Height 12-18 in.: lvs. 3-4, lorate-lanceolate: perianth fine scarlet, campanulate,

2-2½ in.; segms. obovate, cuspidate, very wide beyond middle; anthers purple; filaments glabrous; stigmas small.—"A well-marked garden race, with the habit of *T. Gesneriana*, from which it differs by its small stigma, pubescent peduncle, and bright red fl.-segms., with a broad black basal blotch."—Baker.

26. *Micheliana*, Hoog. Bulb ovoid, to about 1½ in. diam., the outer brown coats clothed inside with long buff-colored hairs: scape pubescent, about 1 ft. high: lvs. usually 4, very glaucous, often brown-striped, lanceolate and the upper ones linear-lanceolate, very undulate: fls. single, large, vermilion-scarlet inside and lilac-tinged outside; outer segms. oblong-ovate and cuspidate; inner segms. obovate, mucronate; all segms. with black lanceolate blotches at base. Steppes of Trans-Caspia. G.C. III. 31:353.

27. *Tubergeniana*, Hort. Outer bulb-scales hairy inside: lvs. broad-lanceolate-acuminate: fls. single, large, vivid crimson with very dark-margined blotch at base of the broad acuminate-pointed segms.; bud before expansion conical with tips of outer segms. reflexed. Bokhara. G.C. III. 35, suppl. June 4. G.M. 51:711. F.E. 3:94.

28. *ingens*, Hoog. Bulb ovoid and large, the outer scales covered on inside with long silky hairs, especially toward the base and the apex of the bulb: st. or scape about 10 in. high, pubescent: lvs. 3, undulate, the lowest broad-lanceolate and the upper linear-lanceolate, very glaucous, and the upper surface white-hairy: fls. very large, to 4 in. long, funnel-shaped, bright scarlet-vermilion with a prominent black blotch at base or covering entire claw; inner segms. obovate, mucronate; outer segms. oblong-ovate, mucronate, bearing outside a broad yellowish band; filaments subulate, glabrous. Bokhara. G.C. III. 32:14.

29. *Maximowiczii*, Regel. Lvs. erect: peduncle glabrous: perianth crimson, with a black basal blotch; segms. obtuse, ending in a short sharp point; anthers light purple; filaments linear, not bearded. E. Bokhara, 1889. Closely allied to *T. linifolia*, from which it differs in having outer bulb-tunic hairy at apex (not woolly), erect lvs. and sharp-pointed perianth-segms. Gt. 38:1307. G.C. III. 19:757.

30. *Kesselringii*, Regel. Lvs. 4-5, crowded at base of st., lorate-lanceolate, or linear channeled: peduncle sometimes obscurely puberulent: perianth campanulate, 1½-2 in. long, bright yellow, flushed with red and green outside; inner segms. subobtusely, outer acute; stamens bright yellow; filaments glabrous; stigmas not equal to ovary-diam. Turkestan. B.M. 6754.

31. *platystigma*, Jord. Height 18 in.: st. slender, glabrous: lvs. 3-4, very much undulated: peduncle glabrous: perianth campanulate, 2 in. long, violet-scented, magenta-red; segms. obovate-oblong; claw blue tinted with a yellow spot in the middle; filaments not bearded; anthers violet-colored; ovary prismatic; stigmas very large and undulated. France.

32. *Korolkowii*, Regel. Height 6-9 in.: lvs. 2-3, falcate, margin crisped: perianth campanulate, red, with a distinct black basal blotch; inner segms. oblong, outer obovate; filaments lanceolate; stigmas small. Turkestan, 1875. Var. *bicolor*, Hort. Wallace. Described as having fls. about the size of those of *T. Chusiana* and "of extreme beauty in form and coloring; the buds are of a soft buff and yellow tone, and, when expanded, the segments display a scarlet blotch." Gn. 59, p. 275.

33. *Kaufmanniana*, Regel. Less than 12 in. high: lvs. 2-3; perianth subcampanulate, 2-3 in. long, 2½-4 in. across, bright yellow in original form, tinged with red outside, without basal blotch; in cult. very variable in color, often cream-white, and nearly always with a deep yellow basal blotch; anthers lemon-yellow, linear;

filaments bright orange, linear flattened; ovary pyramidal; stigmas small in cult. form, but described as large. Turkestan, 1877. B.M. 6887. G.C. III. 51:217. Gn. 65, p. 198; 71, p. 199; 72, p. 190; 75, p. 216; 77, p. 195; 78, pp. 178, 506. Gn.W. 21:345. G.M. 56:211. Var. *aurea*, Hort. Segms. of perianth red, with yellow markings outside and entirely yellow or orange-yellow inside. Gn. 74, p. 241. G.M. 47:147. Var. *coccinea*, Hort. Fls. rich brilliant scarlet, at the base clear yellow.—*T. Kaufmanniana* is a handsome and valuable species, blooming exceptionally early. Sometimes called "water-lily tulip," from the resemblance of the partially opened fls. to those of nymphaea.

34. *Hoogiāna*, Fedtsch. Outer bulb-scales covered on inside with reddish hairs: st., including bloom, 6–18 in. high, smooth: lvs. 4–6, lanceolate-tapering, smooth, with a narrow membranous white short-ciliate margin, the lowest 8–10 in. long and $1\frac{1}{2}$ –3 in. broad: fl. scarlet, with a large black blotch bordered with orange on each segm. within the cup and a corresponding yellow mark on the outside; segms. broad, somewhat abruptly acuminate at apex; filaments linear-lanceolate, blackish violet; anthers blackish. Cent. Asiatic desert (Bokhara), "a brilliant and striking species." G.C. III. 48:62.

35. *saxatilis*, Sieber. Distinct: bulb ovoid, medium size: height 12 in. or more: st. usually branched low down and bearing 2 fls.: lvs. usually 3, sometimes lowest 12 in. long, lanceolate or linear and glabrous: perianth oblong-funnelform, 2–2½ in. long, 3 in. across, light mauve-purple, at base bright yellow; segms. pubescent at base, all acute and the inner ones obovate-cuspidate; anthers blackish; filaments bright yellow; ovary prismatic; stigmas small. Crete. B.M. 6374. Gn. 56:102; 72, p. 214; 77, p. 196.

36. *armēna*, Boiss. Lvs. 5, crowded at base of st., falcate, glaucous and glabrous, slightly undulate, long, ciliate on edge all around, longer than fl.-stalk: peduncle glabrous, finely dotted: perianth open-campanulate, slightly sweet-scented, 2 in. long, dark scarlet with black basal blotch margined all around with yellow; inner segms. rounded, outer acute; anthers purple; filaments flattened, black, not bearded.—This name is referred by Baker without hesitation to *T. Gesneriana*, but the plants in the trade as *T. armena* differ as indicated above.

37. *Billietiana*, Jord. & Fourr. Lvs. 3–4, undulate, not ciliate on edge: perianth open-campanulate, 2 in. long, 3½ in. across, inodorous, bright yellow, flushed with scarlet-pink, especially outside, with obscure basal blotch striated with blue-black lines; anthers dark gray or blackish; filaments yellow, with dark striations; ovary narrowed at collar; stigmas light yellow, very large and crisped. Savoy, Italy. B.M. 7253. G.M. 38:311.—One of the late tulips.

38. *Didiēri*, Jord. Height 12–18 in.: lvs. 3–4, undulate, acuminate: perianth campanulate, 2–2½ in. long, 4½ in. across, bright crimson, with purple basal blotch margined with yellow or yellowish white; outer segms. reflexed; stamens same color as basal blotch; ovary narrowed at collar; stigmas larger than collar-diam., white. Savoy, Italy, and Alps. B.M. 6639. Gn.W. 21:1067. Var. *Mauriana*, Baker. Lvs. narrower, slightly undulate: perianth brilliant red, with wide yellow blotch. Var. *planifolia*, Baker. St. slender: lvs. narrow, not undulate: perianth deep red, faintly marked with yellowish red or blackish blotch. Var. *alba*, Krelage. Peduncle stiff, mottled with red: perianth light lemon-yellow, or white tinged green outside, basal blotch limited to a few dark striations; filaments same color as fl. Var. *lutescens*, Krelage. Lvs. 3, slightly falcate: perianth light yellowish white streaked with red, with a bluish violet, dark basal blotch; filaments colored like the blotch in perianth. Var. *albiflora*, Hort., white-fl., is mentioned. G.W. 12, p. 378.

A5. Outer bulb-tunic pubescent inside, often or mostly densely so at apex.

B. Perianth-segms. very long, linear, and acuminate.....39. *acuminata*

BB. Perianth-segms. oblong, all uniform and acuminate.....40. *retroflexa*

BBB. Perianth-segms. abruptly cuspidate.41. *Borszczowii*

BBBB. Perianth-segms. all narrowly oblong; inner acute, outer rounded at top.....42. *Dammannii*

39. *acuminata*, Vahl. Fig. 3872. Height 12–18 in.: lvs. 4, lowest lanceolate, all undulate at margins: peduncle shining: perianth very open, light yellow splotted with red lines; segms. sometimes 4½ in. long, less than ½ in. wide, with edges rolled in; stamens yellow; filaments flattened, glabrous; ovary prismatic; stigmas very large, yellow, not undulate. Turkey(?) "This, the well-known Turkish tulip, is a most distinct type, of which the native country is not clearly known. It has the bulb, leaf, and glabrous peduncle of *T. Gesneriana*, and the flower is similarly variable in color."—Baker.

40. *retroflexa*, Hort. Lvs. long-lanceolate, sometimes linear-lanceolate, slightly ciliate on edge, otherwise glabrous: peduncle somewhat shining: bud nodding; perianth open funnelform-campanulate, yellow, a shade darker at base—a trace of a very obscure basal blotch; segms. uniform in width, linear-lanceolate, acuminate, twisted, undulate edges; stamens yellow; filaments flattened, glabrous. A supposed garden hybrid between *T. Gesneriana* and *T. acuminata*. Gn.W. 23: suppl. July 7. Gn. 78, p. 452.

41. *Borszczowii*, Regel (later spelled *Borszczowii*). Pronounced *Borshövii*. Bulb ovate, fuscous, outer tunics pubescent within: plant glaucous, very glabrous: st. 12–18 in. high, white pruinose, lower third covered with lacerate scarios sheaths, 1-fl.: lvs. bluish green, ovate-lanceolate, gradually attenuate from the broader base to the apex, decreasing in size, four in number, the lower up to 6 in. long, more or less undulate; petals cuneate-obovate, apex rounded to the noticeably abrupt cusp, red with an obovate black blotch at base; stamens glabrous. Steppes of Kara-Kum on the Aral Sea. Gt. 33:1175.

3872. *Tulipa acuminata*.—A form with long-pointed petals, the old Turkish garden pattern. ($\times \frac{1}{2}$)

42. *Dámmannii*, Regel. Height 6 in.: lvs. 4, placed whorl-like at middle of st., linear-lanceolate, recurved, obscurely bristly, ciliate on margin, otherwise glabrous; peduncle glabrous; perianth spreading, star-shaped, purplish or reddish with an oblong-lanceolate black blotch without yellow border; segms. narrowly oblong; filaments filiform, glabrous; stigmas broader than ovary-diam. Mt. Lebanon, 1889. Gt. 38:1300.—Allied to *T. linifolia* and *T. Maximowiczii*.

A6. Outer bulb-tunic woolly at apex inside.

B. Filaments bearded at base.....43. *Lownei*

BB. Filaments not bearded.

C. Perianth crimson or scarlet, with a distinct basal blotch.....44. *linifolia*
45. *Wilsoniana*
46. *montana*

CC. Perianth yellow, without basal blotch. 47. *Batalinii*

43. *Lownei*, Baker. Height 2-4 in.: st. glabrous, sometimes 2-headed: lvs. 2, lanceolate, acuminate, falcate, glabrous; peduncle slender, glabrous; bud slightly nodding; perianth funnelform, small, white with a bright yellow basal blotch, tinged outside with light purple or purplish pink, inner segms. wider; stamens yellow; ovary narrowed at collar; stigmas very small. Mountains of Syria and Palestine, 1874.

44. *linifolia*, Regel. Dwarf: bulb ovoid, $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., the tunics blackish and "bearded inside at the apex with brownish hairs;" st. somewhat shining, sometimes 2-headed: lvs. 6 or 7, linear and grass-like, spirally arranged, spreading, glabrous; perianth open-campanulate, small, bright crimson; basal blotch bluish black; inner segms. oblanceolate, outer ovate and slightly wider; anthers pinkish; pollen gray; filaments bluish black; ovary pyramidal; stigmas very small, yellowish white. Bokhara. B.M. 7998. Gn.W. 21:707.

45. *Wilsoniana*, Hoog (*T. Watsoniana*, André). Differs from *T. linifolia* in bearing a mass of protruding woolly hairs from the bulb rather than short and bristly hairs, in having fewer and somewhat broader lvs., fls. more distinctly margined with red and more upright-growing in the later stages of development, in the obovate inner segms., and in the longer ovary and broader filaments. Mountains of Trans-Caspia, southwest of Aschabad. G.C. III. 29:327.—Named for G. F. Wilson of Weybridge, England. The fls. are "of a particularly deep and full vermilion-scarlet;" outer segms. oblong, with small cusp; inner segms. obovate, more or less retuse; scape short, 2-4 in. high.

46. *montana*, Lindl. Bulb large and ovoid, with dense pubescence: height 4-8 in.: lower lvs. oblong-lanceolate, acuminate, undulated, very glaucous; peduncle glabrous; perianth campanulate, $1\frac{1}{2}$ -2 in. long, 2 in. across, deep crimson, paler outside; segms. ovate or oblong, flat, acute, the inner often obovate obtuse; filaments purplish; ovary prismatic; stigmas small. Mountains of Persia. B.R. 1106. Var. *Julia*, Koch. Dwarf, from Caucasus. Not more than 3-4 in. tall: fls. bright red, 1 in. or less long; all 6 segms. obovate and obtuse.

47. *Batalinii*, Regel. Bulb globose, with thin tunic: height 5 in.: st. glabrous; lvs. 5, crowded into a sort of whorl just below middle of st., linear-lanceolate, glabrous, slightly undulated; perianth campanulate, slightly funnelform, pale yellow; segms. slightly unequal, oblong-ovate, obtuse or short-acute, sometimes deeply incised on the edge near the top; filaments linear, terete, yellow; ovary elliptic-oblong, compressed, trigonous; stigmas coroniform. E. Bokhara, 1889. Gt. 38:1307. B.M. 7991. G.C. III. 19:759; 49:382.—One of the early tulips.

A7. Outer bulb-tunic everywhere woolly inside.

B. Filaments bearded at base.

C. The filaments flattened.....48. *biflora*

CC. The filaments cylindric.....49. *Clusiana*

BB. Filaments not bearded.....50. *stellata*

C. Perianth bright yellow, with obscure basal blotch or none.....51. *Bieber-*

CC. Perianth bright scarlet, with a distinct black or purplish basal blotch margined with yellow.....52. *Oculus-solis*
53. *præcox*

48. *biflora*, Pall. Height 3-6 in.: st. glabrous or slightly pilose, usually 2- or 3-fld., rarely 4-, 5- or 6-fld.: lvs. often 2, sometimes 3, linear, long; perianth funnelform-campanulate, 1 in. long, 2 in. across, pale yellow or white inside, tinged with green or red or even purplish outside; segms. acute; filaments flattened, ciliated at base; ovary narrowed at collar; stigmas small. Mountains of Cent. Siberia and the Caucasus. B.R. 535. B.M. 6518. Var. *turkestanica*, Hort. More robust than the type and larger in all its parts: fls. often 4 or 5 on the scape. G.C. III. 47:85.

49. *Clusiana*, Vent. Described by Baker as "one of the most widely spread and clearly marked of all the tulips, and one that shows the least tendency to vary;" bulb small and densely pilose: height 12-18 in.: st. slender, glabrous; lvs. 4-5, very long and narrow and folded double, linear-acuminate, pendent; peduncle slender, tinged with brown directly under fl.: perianth small, when open 2 in. across, funnelform-campanulate, very fragrant, delicate white (sometimes described as lemon-yellow), with a purplish black base and black stamens, outside flushed with red; segms. acute; claw hirsute on edge; stamens yellow; filaments cylindric, densely bearded at base; ovary pyramidal; stigmas small, tinged with red. Portugal, through Medit. region to Greece and Persia. B.M. 1390. Gn. 77, p. 171. Gn.W. 22:329.

50. *stellata*, Hook. Close ally of *T. Clusiana*, with similar lvs. and habit, according to Baker, but the segms. more obtuse and the fl. always without the distinct purple eye, the fl. very wide open in sunlight. Himalaya. B.M. 2762.—Bright yellow variations are mentioned.

51. *Biebersteiniiana*, Schult. f. Height 6 in.: st. slender, glabrous; lvs. 2-4, crowded together, long, channeled, glabrous, slightly ciliated on edge; bud slightly nodding; perianth open-campanulate, $2\frac{1}{2}$ in. long, bright yellow tinged with scarlet-pink on edges and sometimes green outside; at base a brownish yellow discoloration; inner segms. obtuse, outer acute; anthers gray; pollen yellow; filaments yellow; ovary prismatic; stigmas yellow, undulated. Asia Minor.

52. *Oculus-solis*, St. Amans. Tall, 12-18 in.: st. slender, glabrous; lvs. 3-4, lorate-lanceolate, acute, glabrous; perianth funnelform-campanulate, $2\frac{1}{2}$ -3 in. long, $4\frac{1}{2}$ in. across, scentless, erect; segms. bright red, with a large long black yellow-bordered blotch, very acute, the inner ones often less so; anthers yellow; filaments purple; ovary prismatic. South of France, Italy, and Switzerland. B.R. 380 (as *T. Gesneriana*). Var. *Lortetii*, Baker. A slight variety, the basal spot oblanceolate and black. Marseilles. Var. *lycica*, Baker. St. 6-8 in. long; lvs. crowded; perianth-segms. all acute, inner oblanceolate-oblong; apex subdeltoïd; blotch black; anthers and filaments dark purple. Lycia, Asia Minor. Var. *aléppica*, Baker. A form with fls. considerably smaller than W. European type, with a smaller black basal blotch. Asia Minor, Syria, and Palestine.

53. *præcox*, Tenore. Height, 12-18 in.: st. slender, glabrous; lvs. 3-5, lorate-lanceolate, acute, undulated at margin; perianth beautiful scarlet, campanulate, 2-3 in. long, 3 in. across, erect, scentless; basal blotch oblong or oblanceolate and purplish black, margined with yellow; segms. widely imbricated, outer slightly longer, acute, puberulent at apex; inner shorter, obtusely cuspidate; anthers yellow; filaments long, dark purple, glabrous; ovary prismatic; stigmas pubescent, reddish. Italy and S. France; also Algeria,

CXIV. Tulip varieties of the *Tulipa Gesneriana* type

Greece, Syria, Palestine, and Persia. Very closely allied to last, and figured as such in B.R. 204, 1143, 1419; differs, according to Baker, "by its more robust habit of growth, earlier flowering, and ovate more imbricated perianth-segms., with a less clearly marked basal blotch."—One of the oldest known species.

T. flava, Hort., is "often confused with vitellina in gardens, though perfectly distinct. Flava is yellow, very robust, tall, and at least a fortnight later in blooming. Vitellina is almost white when old." Imperfectly known.—*T. Fosteriana*, Hort. Fls. very large, rich intense glowing crimson with a darker blotch at the base of the segms.: lvs. very broad, many-nerved: of robust habit and easily grown. Bokhara. G.C. III. 39:323.—*T. galatica*, Freyn. Tunics silvery hirsute within: st. glabrous: lvs. linear-lanceolate, acuminate: fls. yellow; outer segms. elliptic to oblong-elliptic; inner segms. spatulate, rounded. Asia Minor.—*T. lanata*, Regel. Dwarf: fls. large, goblet-shaped, rich vermilion, with a large black spot at the base of each of the segms. Bokhara.—*T. Leichtlinii*, Regel. Bulb-tunics glabrous inside: height 9-18 in.: st. glabrous: lower lvs. lanceolate-linear: fl. erect; perianth between campanulate and funneliform; outer segms. narrow and acute, the outer bright purple with broad white margin, the inner much shorter and obtuse at apex and yellowish white. Kashmir. Gn. 40:174.

ARNOLD V. STUBENRAUCH.
L. H. B.†

TUMBÔA (native name). *Gnetaceæ*. Applying strictly the rules of priority, *T. Bainesii*, Hook. f., becomes the name of the strange plant long known as *Welwitschia mirabilis*; in this work, the description is given under the latter name.

TUNGSHU: *Aleurites Fordii*.

TÛNICA (Latin, a *tunic* or *coat*, from the imbricated involucre). *Caryophyllaceæ*. Annual or perennial hardy herbs, usually slender but stiff garden plants, with the habit of *Gypsophila* but botanically more nearly allied to *Dianthus*; sometimes grown in flower-gardens.

Leaves narrow: fls. as in *Dianthus*, but smaller, gathered in cymose panicles or heads; calyx turbinate or elongate-tubular, obtusely 5-toothed, 5-15-nerved; petals 5, claw elongate, blade retuse or emarginately 2-cleft; stamens 10; ovary 1-celled: caps. ovoid or oblong, dehiscent by 4 valves.—About 20 species, S. Eu. and E. Asia. Prop. by seeds or division

Saxifraga, Scop. Apparently the only species in cult. A tufted spreading hardy plant suitable for rockwork and blooming in summer and fall. It is a wiry-stemmed perennial, growing 6-10 in. high: fls. small, with rosy white, lilac or pale purple notched petals. G. 34:211.—Has become adventive in some parts of the E. Var. *alba*, Hort., is a white-fl. form. Var. *albo pleno*, Hort., is a double white-fl. form. Var. *flore-pleno*, Hort. (*T. Saxifraga* var. *plena*, Hort.), has semi-double fls. about $\frac{1}{2}$ in. across and deeper pink than the type.

F. TRACY HUBBARD†.

TÛPA (Peruvian name of the plants). *Campanulaceæ*. Tall herbs with many-fl. terminal racemes: fls. usually red or yellow; corolla-lobes all incurved, cohering at the apex by day. About 8 species from Chile. Now considered a section of *Lobelia*. *T. crassicaulis*, Hook. Subshrub about 3 ft. high: st. erect, simple, stout: lvs. densely clustered at the top of the st., spreading, reflexed, lanceolate, or broad-lanceolate, acute, base attenuate to a short petiole, serrate, pubescent above, hoary-tomentose beneath: calyx-tube hemispherical, segms. spreading, acuminate; corolla yellow-orange (finally scarlet), tube laterally compressed, limb 2-lipped. Habitat uncertain. B.M. 4505. J.F. 1:107. This has never been transferred to *Lobelia*; it may be a *Siphocampylus* rather than a *Lobelia*.

T. salicifolia, Don=*Siphocampylus giganteus*.

TUPIDÁNTHUS (Greek, *mallet* and *flower*, referring to the shape of the fl.-buds). *Araliaceæ*. At first a glabrous small tree, becoming with age a tall climber: lvs. large, digitately compound; lfts. coriaceous, entire; stipules connate: umbellules arranged in a short panicle or compound umbel: fls. large for the order; petals connate

in a leathery or fleshy hood; stamens numerous; disk convex: fr. leathery to fleshy, subglobose. One species, India. *T. calypttratus*, Hook. f. & Thoms. Lvs. digitate; lfts. 7-9, entire, $7 \times 2\frac{1}{2}$ in., narrow-oblong, short-acuminate, narrowed at base; petiolules 2 in. long: main umbel about 3-rayed, branches 3 in. long with large bracts at their bases; umbellules 5-7-cleft: fls. green; stamens 50-70. India. B.M. 4908.

TUPÍSTRA (Greek, *mallet*, alluding to the peculiar shape of the stigma). *Liliaceæ*. Perennial herbs grown in the warmhouse. Rhizome stout, sometimes short and tuberous, sometimes elongated and annulate: lvs. radical, long, large, contracted into the petiole: scape radical, between the lvs., short or elongated, erect or recurved at the top, simple, terminated by a dense cylindrical spike: fls. sessile, grouped, violet or lurid; perianth campanulate, 6-, rarely 8-lobed, short and spreading; stamens as many as corolla-lobes; ovary free, sessile, 3- rarely 4-celled, cells 2-ovuled: berry globose, usually 1-seeded.—About 13 species, India, Burma, and Malaya. Probably no species in general cult.

The following species have been intro. into botanic gardens: *T. Clarksii*, Hook. f. Robust glabrous herb with a thick creeping rhizome: lvs. oblanceolate, 4-5 ft. long, 2-5 in. broad, entire, shining: peduncles 3 in. long, bearing nodding or almost pendulous spikes, 3-4 in. long: fls. about $1\frac{1}{4}$ in. across, dull reddish purple inside, at first green with perianth-lobes purple-margined, finally all buff. Sikkim. B.M. 7957.—*T. grandis*, Ridley. Lvs. tufted, 2-3 ft. long, lanceolate: peduncle stout, red-brown, bearing a spike 10-12 in. long: fls. subsessile, crowded; perianth campanulate, tube $\frac{1}{2}$ in. long, red-brown, lobes dark red-purple; stigma broadly peltate, on a white columnar, exserted style. Perak. B.M. 7829.—*T. Macrostigma*, Baker (*Macrostigma tupistroides*, Kunth). Rhizome thick, creeping: flowering tufts usually 2-lyd.: lvs. petioled, lanceolate, 1 ft. or more long, acute, chartaceous, narrowed from above the middle to the point and petiole, bright green on both surfaces: peduncle dark purple, erect; spike drooping, lax, about 2-3 in. long: perianth campanulate, dark purple, about $\frac{1}{2}$ in. across; ovary globose. Mountains of N. India. B.M. 6280. Gt. 6:130.—*T. perakensis*, Hort., is not known botanically; it is described as having elegant narrow lvs. and erect fl.-spikes 8 in. long, the upper half clothed with fleshy shining, purple fls. with a pure white, disk-like spreading flat stigma. Singapore.

F. TRACY HUBBARD.

TURNÈRA (named after William Turner, died 1568). *Turneraceæ*. Glabrous, pubescent or tomentose herbs, shrubs, or subshrubs, suitable for warmhouse cult. Lvs. sparse, entire, serrate or somewhat pinnatifid; stipules small or none: fls. axillary, solitary, rarely racemose or fascicled, yellow; calyx tubular, funneliform or campanulate, limb 5-parted; petals 5; stamens 5; ovary sessile, free, oblong: caps. ovoid or oblong, 3-valved at base, many-seeded, very rarely 3-seeded. About 85 species, Trop. and Subtrop. Amer., S. Afr., and Madagascar. *T. ulmifolia*, Linn. Shrub, 2-4 ft. high: lvs. biglandular at base, oblong, ovate or lanceolate, acuminate, serrate above the cuneate base, petioled, pubescent above, white-tomentose beneath: fls. yellow, almost sessile; calyx deeply 5-lobed, lobes lanceolate, acuminate; petals large, obovate. Mex., W. Indies, and S. Amer. B.M. 4137. Var. *elegans*, Hort. (*T. trioniflora*, Sims), is about 1 ft. high: lvs. oblong-lanceolate, coarsely serrate: fls. sessile, pale yellow or sulfur-colored, with purplish brown claws. Brazil. B.M. 2106. G. 28:381. H.F. II. 3:160. The family *Turneraceæ* is placed near *Violaceæ* and *Passifloraceæ*.

TURNIP is a name somewhat loosely applied to two species of vegetables. In this country, and apparently properly, it is applied to vegetables characterized by thick light-fleshed roots that are usually more or less flattened or at least not greatly elongated, with leaves that are hairy and not glaucous. These vegetables belong to the species *Brassica Rapa* (see page 543). In the term is sometimes included the Swedish turnip or rutabaga, a plant that is characterized by having a more uniformly elongated-oval yellow-fleshed tuber with roots springing from its lower part, a thick elongated leafy neck, and glaucous-blue leaves that are not hairy. This plant is considered to be *Brassica*

campestris var. *Napo-Brassica*. Whether these two species exist separately in wild nature is not positively known, but they appear to be well defined under cultivation. Both species tend to run wild in old fields and to lose their thickened roots. They are then sometimes, though erroneously, known as charlock. (The real charlock is *Brassica* [*Sinapis*] *arvensis*, one of the mustards). The nativity of these species is unknown, but they are almost certainly European or Asian in origin. Characteristic tubers of these two plants are contrasted in Figs. 3873 and 3874. The former is commonly known here as "flat turnip" and the latter as rutabaga or merely "baga." According to Vilmorin, the plant that we know as rutabaga is known to the French as chou-navet and in England as Swedish turnip and turnip-rooted cabbage.

The culture of turnips and rutabagas is very similar, except that the rutabaga requires a longer season. The rutabaga is nearly always grown as a main-season

3873. Turnip.—*Brassica Rapa*.

3874. Rutabaga.—*Brassica campestris* var. *Napo-Brassica*.

crop, whereas the turnip may be sown very late for winter use or very early for late spring or summer use. Usually the flat turnip is not grown in the hot weather of summer. In the northern states it is sown from the middle of July to the middle of August for late crop, or on the first approach of spring in order that tubers may be had for the early vegetable market. The late or winter crop is ordinarily used for storing in cellars and also for feeding, whereas the early crop is often sold in bunches in the open market, and later by the basket or bushel.

The turnips and rutabagas are hardy; that is, the young plants can withstand some frost. They are cold-weather plants and demand loose moist soil. Usually the seeds are sown in drills that stand from 10 to 20 inches apart. In the drills the plants are thinned until they stand from 6 to 10 inches apart, depending on the variety. For general field operations, the rows are sometimes placed as far as 30 inches apart, to allow horse tillage. Sometimes the late or winter crop is raised from seed sown broadcast, but this method gives good results only when the soil is well supplied with moisture, very thoroughly tilled beforehand and is free from weeds, since subsequent tillage is impossible. The seeds of turnips and rutabagas are of similar size, two or three pounds being required to the acre for broadcasting. When sown in drills, one-half or one-third this amount may be sufficient. The yields will sometimes reach 1,000 bushels to the acre, although the average is much less than this.

The turnip needs no special care as to cultivation.

The greatest difficulties are the root-maggot, which is the larva of a small fly, and the flea-beetle. The maggot may be killed by injecting bisulfide of carbon into the soil about the roots before the grubs have burrowed deeply into the tissues. In general field operations, however, this treatment is impracticable and one must rely on growing the crop in fields which are not infested with the maggot; that is, rotation is the chief recourse. The flea-beetle may be kept in check by spraying the plants with bordeaux mixture, or perhaps better by sprinkling them with paris green diluted with land-plaster (one part by bulk of paris green to fifty of plaster).

Rutabagas have firmer and richer flesh than the turnips. They are usually more prized for consumption in winter, and turnips are usually more popular in the spring and early fall markets. Rutabagas are also more prized for stock-feeding. They yield heavily, are rich and succulent and keep well in any ordinary cellar. Rutabagas started in the middle or last of June in the northern states will reach their full growth by October. They are usually not harvested until heavy frosts have come. The roots of rutabagas and turnips sometimes persist through the winter, even though they have been solidly frozen, and send up flower-stalks in the spring; but unlike salsify and parsnips the roots should not be left in the ground to freeze if they are to be used.

L. H. B.

TURNIP, INDIAN: *Arisæma triphylla*.

TURPÍNIA (named for Turpin, French fl.-painter, died 1840 in Paris). *Staphyleaceæ*. A genus of about 10 shrubs or trees in Trop. and Subtrop. Asia, the Malay Archipelago, W. Indies, and Mex., with opposite odd-pinnate or simple lvs. and small fls. in large terminal or axillary panicles: calyx 5-parted, persistent; petals 5, broadly spatulate to orbicular; stamens 5; ovary superior, 3-celled, with a large lobed disk at the base; styles 3, distinct or united: fr. 3-celled, fleshy or leathery, with few or many seeds in each cell. Occasionally planted for their handsome foliage in S. Calif. Prop. is by seeds or by cuttings of mature wood under glass with bottom heat.

pomifera, DC. Glabrous tree: lvs. odd-pinnate, 5-20 in. long; lfts. 3-9, elliptic-oblong or ovate, acuminate, crenate-serrate, 3-8 in. long: fls. yellowish, $\frac{1}{2}$ in. across, in large terminal panicles, 6-10 in. long: fr. fleshy, red, yellow, or greenish, 1-2 in. across. Himalayas. The closely allied *T. nepalensis*, Wall., with smaller fls. and much smaller fr. is probably only a variety of this species. S.I.F. 2:40 (as *T. pomifera*).

arguta, Seem. (*Ochránthe arguta*, Lindl.). Glabrous shrub or small tree: lvs. simple, obovate-oblong to oblong-lanceolate, acuminate, cuneate at the base, serrate, 3-5 in. long: fls. white, changing to yellowish, about $\frac{1}{3}$ in. long, in terminal panicles $2\frac{1}{2}$ -5 in. long: fr. about $\frac{1}{3}$ in. across. S. China. B.R. 1819.

ALFRED REHDER.

TURRÆA (named for Giorgio della Torre or Turra, 1607-1688, botanist of Padua, Italy). *Meliaceæ*. Trees or shrubs, sometimes grown in the greenhouse in the North; in the South used as outdoor ornamentals.

Leaves alternate, petioled, entire or obtusely lobed: peduncles axillary, few-fl. and many-bracted: fls. elongated, white; calyx 4-5-toothed or parted; petals 4-5, elongated, free, twisted; staminal tube 8-10-toothed, anthers 8-10; disk annular; ovary oblong, 5-10-20-celled; ovules 2, superposed in each cell: caps. 5- to many-celled, loculicidally 5- to many-valved.—About 73 species, Trop. and S. Afr., Trop. Asia, and Austral.

A. Fls. solitary or in pairs, axillary.

heterophylla, Smith, not Sond. Lvs. more or less obovate-cuneate, 3-lobed above, varying to subentire: fls. $\frac{1}{2}$ - $\frac{3}{4}$ in. long. Upper Guinea. B.R. 30:4 (as *T.*

lobata).—This name is in the Fla. trade, but it seems open to doubt whether the plant is this species.

AA. *Fls. clustered at ends of branches.*

floribunda, Hochst. (*T. heterophylla*, Sond.). Shrub: foliage falls away before flowering season: lvs. ovate, acute or produced into a short obtuse point, undivided or 3-lobed: fls. clustered at ends of branches: peduncles and calices silky tomentose. Natal.

F. TRACY HUBBARD.†

TUSSILAGO (Latin, *tussis*, cough, and *ago*, referring to the medicinal use of the lvs.). *Compósitæ*. Here belongs the COLTSFOOT, the flowers of which look much like the dandelion; the leaves are large and make an attractive low covering for rough banks.

Acaulescent perennial herb more or less white-tomentose: fls. in a dense head on a scaly scape, before the lvs. of the season; tubular and ray-fls. about in equal numbers, the rays pistillate and fertile and in several rows; disk-florets sterile; receptacle flat; involucre campanulate or cylindrical, the scales in a single series: achene narrow, with soft capillary pappus.—One species.

Fárfara, Linn. COLTSFOOT. Resembles the dandelion in having scapes bearing solitary yellow fl.-heads composed of rays, but the scapes are scaly and the heads are smaller, lighter colored and borne in early spring before the main crop of dandelions. After the fls. have lost their beauty, the lvs. appear; they are heart-shaped and rounded at first, but as they grow they become more and more angled. They are covered with a soft cottony matting which diminishes toward the end of the season. It grows naturally in moist places and thrives on steep raw banks in the stiffest clay. Spreads rapidly by underground sts. Flowers in March. Native to Eu., India, and N. W. Asia. Naturalized in Amer. Gn. 23, p. 113.

Var. *variegata*, Hort., has lvs. margined and more or less blotched with white or yellow. Gn. 37, p. 435. Lowe 56.—More commonly cult. than the type.

T. fragrans==*Petasites*.

WILHELM MILLER.

TUTCHERIA (after W. J. Tutchet, assistant superintendent of the Botanical and Forest Dept. of Hong-Kong). *Ternstræmiaceæ*. Two species of evergreen trees in S. E. China, with alternate, ovate-lanceolate lvs. and axillary, showy, white fls.: sepals imbricate in 2-3 series, silky outside, the inner ones becoming petaloid; petals 5, large; stamens many, connate at the base and adnate to the petals; ovary 4-6-celled; styles united nearly to the apex: caps. globose, woody, dehiscent with 3-6 valves; seeds angular, 2-5 in each cell. The following species has been recently intro. into England; to be recommended for its showy white fls. Hardiness and cult. probably like *camellia*. **T. spectabilis**, Dunn (*Camellia spectabilis*, Champ.). Small tree: lvs. short-petioled, ovate-lanceolate, acuminate, cuneate at the base, slightly crenate, lustrous above, 5-6 in. long: fls. short-stalked, white, cup-shaped, about 3 in. across, slightly fragrant; petals broadly obovate, emarginate, 1½-2 in. long: caps. globose, 2-3 in. across. Seemann, Bot. Herald, 78.

ALFRED REHDER.

TWAYBLADE: *Liparis liliifolia*.

TWEEDIEA: *Oxyptalum*.

TWIN-FLOWER: *Linnæa borealis*. T.-Leaf: *Jeffersonia diphylla*.

TWISTED STALK: *Streptopus*.

TYDÆA is now considered a synonym of *Isoloma*; by some authorities called *Kohleria* (see *Isoloma*). *T. ocellata*, Regel=*Isoloma ocellatum*. Gt. 4:180. Other species which may have been cult., but probably are no longer in trade are *T. venosa*, Hort. (H.F. II. 3:248), and *T. Warszewiczii*, Regel (Gt. 3:72).

TYPHA (ancient name). *Typhaceæ*. CAT-TAIL. REED MACE. Hardy perennial marsh- or swamp-growing herbs, useful in the water-garden or along brooks or the margins of ponds.

Plants forming colonies, slender or stout, often tall, smooth: rhizome strong, creeping: sts. erect, simple, base often under water: radical lvs. linear-elongated, rather thick, spongy, with or without ribs; cauline lvs. few and shorter: peduncles erect, terete, strict and not divided: spadices, male and female similar, superposed: fls. monœcious, densely clustered in the cylindrical spadix; perianth consisting of slender hairs: fr. minute, subsessile.—About 17 species, temperate and tropical regions. Monographed by Graebner in Engler's *Pflanzenreich*, hft. 2 (IV. 8) in 1900.

A. *Female fls. without bracts.*

B. *Plant robust, more than 3 ft. high: lvs. flat.*

C. *Pedicels columnar, 1.5-2 mm. long.*

latifolia, Linn. Fig. 3875. Plant stout, 4-8 ft. high: lvs. usually broad, linear, ¾-1 in. broad, exceeding the flowering culm: male and female spikes contiguous, rarely remote. N. Amer., Eu., Asia. R.B. 20, p. 196. V. 2:197. J.H. III. 65:325. Var. *elatior*, Graebn. (*T. elatior*, Bor.), has narrow lvs. and shorter contiguous or slightly remote spikes. Eu.

CC. *Pedicels short or elongate-conoid, 1-1.5 mm. long.*

Shuttleworthii, Koch & Sond. Plant stout, 3-4½ ft. high: lvs. linear, 2-6 lines broad, longer than the flowering culm: spikes cylindrical, contiguous, pistillate spikes thick and longer than the staminate. Eu.

BB. *Plant slender, rarely over 3 ft. high: lvs. semi-cylindrical or rather flat.*

Láxmännii, Lepech. (*T. stenophylla*, Fisch. & Mey.). Plant slender, 2½-4½ ft. high: lvs. very narrow, rarely even 3 lines broad, semi-cylindrical, grooved inside, convex outside: pistillate spike ovate-oblong or shortly cylindrical, brown, remote from the elongate staminate spike. S. E. Eu. to China.

AA. *Female fls. in the axils of bracts.*

B. *Plant stout, 3-12 ft. high: axis of male spike hairy.*

angustifolia, Linn. Plant stout, 3-9 ft. high: lvs. narrow, 1-5 or 6 lines broad: spikes about equally long, remote, rarely contiguous; pedicels shortly conoid. N. Amer., Eu. and Asia; also in Trop. Amer.

BB. *Plant slender, 1½-3 ft. high: axils of male spike destitute of hairs.*

minima, Funk. Plant slender, 1-2½ ft. high: lvs. of the sterile shoots very narrow, linear, less than 1 line broad, of the flowering st. basally inflated sheaths rarely bearing very short involute blades: spikes remote or contiguous, female spike broadly ovate or shortly cylindrical, rusty brown. Eu., Caucasus, and Asia.

F. TRACY HUBBARD.

TYPHONIUM (an old name of some plant of the family, named for *Typhon*, a mythological giant). *Araceæ*. Perennial tuberous herbs, occasionally grown in the greenhouse. Lvs. appearing with the fls., sagittate or hastate, 3-5-lobed or -parted or pedately cut; petiole elongated: peduncle usually short: spathes persistent, throat constricted, blade ovate or lanceolate; spadix sessile or stipitate, included; male infl. cylindrical, female short: fls. in an appendiculate monœcious spadix, male and female elements remote; perianth none; stamens in the male fl. 1-3; ovary in female fl. ovoid or oblong-ovoid, 1-celled: berry ovoid, 1-2-seeded.—About 20 species, Trop. Asia, Austral., and islands of the Pacific.

gigantæum, Engl. Tuberous herb of large size: lvs. with petioles 2 ft. long, the lower 8 in., wing-sheathed; blades 1 ft. or more long, hastate, the lobes large, apex acute: spathe-tube oblong, 1¼ in. long, blade acumi-

nate, 6 in. long; spadix with the female fls. below, the male above, the two separated by a sterile portion and the top of the spadix also sterile. China. The type does not seem to be in cult.; the form cult., var. *Giraldii*, Baroni, has larger and broader lvs., the spathe is purplish outside and is somewhat the color of a ripe olive, the tube and blade are more equal in length than the type; spadix is darker, being purplish black; pollen white. Mountains of N. China. G.C. III. 32:151. Probably adapted to outdoor planting for ornament.

F. TRACY HUBBARD.

TYPHONODORUM (Greek, *stormy wind* and *gift*). *Araceæ*. Robust herb, with a stout caudex 4–10 ft. high: lvs. thick, petioled, triangular-ovate or hastate, acuminate: spathes with oblong tubes attenuate at both ends, blade 3 times longer than the tube, oblong-

lanceolate, caudate-acuminate; spadix erect, strict, cylindrical; male infl. elongated, female short and cylindrical: fls. monœcious in an elongated somewhat appendiculate spadix; perianth none; stamens 4–8 in the male fls.; ovary ovoid or subglobose and 1-celled in the female: berry large, compressed, orbicular. One species, Madagascar, Mauritius, and Trop. Afr. *T. Lindleyanum*, Schott (*T. madagascariense*, Engler). St. stout, 3–10 ft. high, 4–12 in. thick: lvs. deeply cordate or sagittate, $1\frac{1}{4}$ – $3\frac{1}{2}$ ft. long, 7 in. to 2 ft. across; petiole terete, 2–4 ft. long: spathe $1\frac{1}{2}$ –2 ft. long, tube 3–5 in. long, oblong, green, blade 13–19 in. long, 3–5 in. across, lanceolate, convolute below, yellow: seeds $1\frac{3}{4}$ –2 in. across, flattened-orbicular, edible. B.M. 8307.—A striking plant with the habit of *Zantedeschia*, growing in deep water. See Engler in *Das Pflanzenreich*, hft. 64 (IV. 23 Dc), 1915.

3875. Cat-tail.—*Typha latifolia*.

U

UDO, a spring blanched vegetable introduced in 1903 by Lathrop and Fairchild from Japan; it is *Aralia cordata*, and for botanical description see page 344, Vol. I.

The plant is a sturdy hardy perennial, and the strong young shoots are blanched as they grow; these shoots are used as a cooked vegetable or as a salad. It is a plant of ancient and widespread cultivation in Japan, where there are distinct strains or varieties of it. The cultivation of udo in this country is in its amateur stage for the most part, although it has been grown by the acre in the Sacramento Valley. The following account is chosen from Bulletin No. 84 of the United States Department of Agriculture, 1914, written by David Fairchild.

"There is no doubt that the udo is worthy of adding to our list of spring vegetables, for it is easily grown, its shoots are readily blanched, and it requires little care. A patch of it can be forced every spring for at least six years, and probably much longer. When properly prepared its blanched shoots are delicious; they have their own characteristic flavor, can be prepared for the table in a great variety of ways, and are keenly appreciated by people of discriminating taste. Space for space, udo will yield about the same amount of food for the table as asparagus and will be ready for use at about the same time in the spring. Possibly more labor is required to blanch the shoots of the udo than those of asparagus, but the udo is probably somewhat easier to take care of and yields sooner."

Udo is readily grown from seeds placed in a greenhouse or coldframe, sown $\frac{1}{4}$ inch deep in March or April. When 3 to 4 inches high, the plants are set in the open ground, standing $3\frac{1}{2}$ to 4 feet apart each way; often they will be 6 feet high by autumn. When it is desired to propagate a particular strain, cuttings may be made of the green shoots taken when about $\frac{3}{8}$ inch in diameter and cut 5 inches or more long, the lower end being severed just below a joint.

The stout young shoots are blanched as they emerge from the ground. In mild climates, earth may be mounded over them, but a large drain-tile placed over the mound provides a better method for the home garden.

This method "has at least one disadvantage, however, in that the shoots have a tendency to leaf out and produce a number of unopened leafstalks which take away from the robust growth of the shoots. A method which has obviated this defect in using tiles is to put around each hill a deep box or small half cask from which the bottom has been removed and fill it with light sand or such a light material as sifted coal-ashes. Shoots which come up through such a medium are almost free from the elongated leafstalks which are

developed when the shoots are produced in the dark air-chambers under the tiles. Care must be taken in any method of mounding up or filling in dirt or ashes over the crowns that the shoots do not break through into the sunlight, for as soon as they do this they become green and take on a rank objectionable flavor.

Properly grown udo shoots produced from three-year-old plants should be from 12 to 18 inches long and 1 inch to $1\frac{1}{2}$ inches in diameter at their bases.

"After the removal of the crop of udo shoots in the spring, the crowns of the plants should be completely uncovered and the plants allowed to grow normally throughout the summer, but they should not be permitted to flower unless seed

is required, the flower-clusters being pinched or cut back as they form."

For use, the shoots are first boiled in salt-water for ten minutes or so and the water changed to remove the turpentine flavor. An hour's stay in ice-water will remove the resin from the shoots, provided they are cut into thin slices or shavings; the slices may then be used in salads without cooking. It is used also in soups, and on toast.

UHDËA. A name proposed by Kunth in 1847 for a Mexican composite, still sometimes listed as *U. bipinnatifida*, Kunth. It is properly *Montanoa bipinnatifida*, Koch, the name *Montanoa* dating from 1825. See page 2064, Vol. IV.

3876. *Ulex europæus*.—Furze.
($\times \frac{2}{3}$)

ÛLEX (ancient Latin name of this or a similar plant). *Legumindœ*. **FURZE**. **GORSE**. **WHIN**. Ornamental woody plants grown for their handsome yellow flowers and evergreen appearance.

Spiny shrubs: lvs. mostly scale-like, only vigorous shoots near the ground bearing fully developed lvs.: fls. papilionaceous, axillary at the end of the branchlets; calyx 2-lipped, divided nearly to the base; standard ovate, wings and keel obtuse; stamens alternately longer and shorter: pods small, ovoid, few-seeded; seeds strophiolate.—About 20 species in W. and S. Eu. and in N. Afr. Closely allied to *Cytisus* and chiefly distinguished by the deeply 2-lobed calyx. The fls. yield a yellow dye. Sometimes cult. as a winter fodder plant in Eu., the green sprigs of one year's growth being eaten.

The furzes are much-branched shrubs with dark green spiny branches, usually almost leafless, and with

showy yellow papilionaceous flowers which are axillary and often crowded at the ends of the branches. They are not hardy North, but under protection they survive the winters in New England. They are valuable as sandbinders for covering dry sandy banks and are also well suited for seaside planting. On account of their dark green branches they have the appearance of evergreen plants and they are very showy when covered with their yellow flowers. They are also sometimes used for low hedges. They prefer sandy or gravelly porous soil and a sunny position; in rich garden soil they grow more rampant, but do not bloom so well. They should be sown where they are to stand, as they do not bear transplanting well, or if this is not feasible, they should be sown singly in small pots and the plants then planted out in their permanent places. Propagation is by seeds sown in spring after the danger from frost has passed; by greenwood cuttings under glass; or by cuttings of nearly mature wood in early summer in a coldframe under glass, forming roots the following spring. Varieties and rarer kinds are sometimes grafted in spring in the greenhouse on *U. europæus*.

europæus, Linn. **FURZE. GORSE. WHIN.** Fig. 3876. Much-branched very spiny rigid shrub, 2-4 ft. high: branchlets striped, villous when young; lvs. scale-like or narrow-lanceolate, pubescent: fls. axillary, 1-3, crowded at the end of the branches and forming racemes; corolla bright yellow, about $\frac{3}{4}$ in. long, fragrant; calyx yellow, hairy: pod oblong, over $\frac{1}{2}$ in. long, villous, dark brown. April, June and often again in Sept., Oct.; in Calif. almost the whole year. W. and S. Eu; naturalized in waste places in the Middle Atlantic states and also on Vancouver Isl. S.E.B. 3:323. R.F.G. 22:2068. G.W. 17, p. 285.—There is a variety with double fls., var. **plenus**, Schneid. (var. *flöre-pleno*, Loud.). Gn. 63, p. 441. G.M. 52:393. Another variety is var. **strictus**, Webb, of upright, pyramidal habit and less spiny, but as it does not bloom freely, it is of little value.

nanus, Forst. Dwarf shrub of dense habit, similar to the preceding species, but smaller in every part, less rigid and with slenderer spines: fls. about $\frac{1}{2}$ in. long, with the wings straight and shorter than the keel; calyx slightly downy, not hairy: pod $\frac{1}{2}$ in. long, nearly inclosed in the calyx. Autumn. W. Eu., England to Spain. S.I.F. 3:325. R.F.G. 22:2068, 3.

ALFRED REHDER.

ULLUCUS (native name). *Chenopodiaceæ*; Volken in Engler's Pflanzenfamilien places this in *Basellaceæ*. Fleshy perennial herbs, decumbent and climbing, grown in Peru and Chile for the tubers: rhizomes

3877. Elm fruits. 1, *Ulmus americana*; 2, *U. racemosa*; 3, *U. alata*; 4, *U. fulva*; 5, *U. glabra*. (×2)

creeping, roots tuber-bearing: sts. angulate: lvs. alternate, thick, petioled, rotund-cordate: fls. hermaphrodite, in axillary, large, lax-fld. racemes, golden yellow; perianth rotate, 5-parted, tube very short; stamens 5; ovary minute: fr. ovoid, berry-like.—One species, Peru, Bolivia, and Chile. *U. tuberosus*, Caldas. **ULLUCO** or **OLLUCO**. Description same as generic. B.M. 4617. G.C. II. 23:216. H.F. 2:48. J.F. 3:221. The tubers,

produced near the base of the plant underground, are much eaten in S. Amer. Sometimes the plant is cult. in northern countries, but only as a curiosity. It is prop. by the tubers, as are potatoes.

ULMÄRIA: *Filipendula*.

ÜLMUS (ancient Latin name of the elm). *Ulmaceæ*. **ELM.** Ornamental trees chiefly grown for their handsome foliage and often planted as shade and street trees.

Deciduous, rarely half-evergreen: winter buds conspicuous, with imbricate scales: lvs. short-petioled, usually unequal at the base, with caducous stipules: fls. perfect or rarely polygamous, apetalous, in axillary clusters or racemes; calyx campanulate, 4-9-lobed, with an equal number of stamens; ovary superior, with a 2-lobed style, usually 1-loculed and with 1 ovule: fr. a slightly compressed dry nutlet, with a broad rarely narrow membranous wing all around (Fig. 3877).—About 18 species of *Ulmus* are known, distributed through the colder and temperate regions of the northern hemisphere, in N. Amer. south to S. Mex., but none west of the Rocky Mts., and in Asia south to the Himalayas. The wood is heavy, hard, and tough and often difficult to split. It is especially useful in the manufacture of wagon-wheels, agricultural implements, and for boat-building. The inner mucilaginous bark of the branches of *U. fulva* is used medicinally and that of some Chinese species is made into meal and used for food. The tough inner bark of some species furnishes a kind of bass which is sometimes woven into a coarse cloth, especially that of *U. japonica* in Japan.

The elms are mostly tall trees, rarely shrubby, with alternate usually 2-ranked, medium-sized or sometimes rather small leaves and with inconspicuous generally greenish brown flowers appearing mostly before the leaves. Most of the cultivated species are hardy North, but *U. crassifolia* and *U. alata* are tender; *U. parvifolia* and *U. serotina* are of doubtful hardiness, although they have persisted near Boston. The elms are mostly tall and long-lived and are very valuable for park planting and for avenue trees, especially *U. americana*, which is the favorite tree for street planting and as a shade tree for dwelling houses in the northeastern states. It is the most characteristic tree of this region and of characteristic beauty. Its habit is at once majestic and graceful, and the wide-spreading head, borne usually at a considerable height on a straight and shapely trunk, affords ample shade and shelter. Besides the American elm several other species are used as avenue trees, as

Ulmus fulva, *U. racemosa*, and the European *U. campestris*, *U. hollandica*, and *U. foliacea*. Of *U. hollandica*, the vars. *belgica*, *superba*, *Klemmer* are among the best for street planting; of *U. foliacea*, the vars. *stricta*, *Wheatleyi*, and *Dampieri*. In the southern states *U. serotina*, *U. crassifolia*, and *U. alata* are sometimes used as avenue trees. There are several varieties of striking and peculiar habit, as *U. glabra* var. *fastigiata* and *U. foliacea* var. *monumentalis*, with narrow columnar head; *U. glabra* var. *pendula*, with horizontal limbs forming widespreading tiers; *U. glabra* var. *Camperdownii* with long pendulous branches. *U. foliacea* var. *umbraculifera*, with a dense, globose and rather small head, may be used

as an avenue tree for formal gardens. Several species and varieties are interesting in winter on account of their branches being furnished with broad corky wings. The foliage of most species turns pale yellow in fall, but that of the European species remains green much longer.

Unfortunately many insects and fungi prey upon the elm, especially on the American elm. One of the most

destructive is the elm leaf-beetle, which destroys the foliage. The canker-worm is also serious; to keep it from doing damage, band the trunks a few feet above the ground with cloth covered with a sticky substance, which prevents the ascent of the wingless female. The trees should be sprayed. A borer, *Saperda tridentata*, sometimes does considerable damage to the wood. The elms grow best in rich and rather moist soil, and the American elm especially requires such a soil to attain its full beauty, but some species, as *U. racemosa* and *U. alata*, do well in drier situations. Elm trees are not difficult to transplant, and rather large trees may be moved successfully if the work is done carefully. They bear pruning well, but generally do not need much attention of this kind. Propagation is by seeds ripening usually in May or June and sown at once. Most of the seeds will germinate after a few days, but some remain dormant until the following spring. Increased also by layers, which are usually put down in autumn and are fit to be removed in one year. A moist and rather light soil is best for this method. Trees raised from layers are said to bear seed less early and less profusely and are therefore especially recommended for street trees, as the foliage of trees that fruit slightly or not at all is larger and more abundant. Dwarf forms of *U. foliacea* and also *U. parvifolia* and *U. pumila* may be raised from greenwood cuttings under glass, the cuttings growing most readily if taken from forced plants. *U. campestris*, *U. foliacea*, and some of their varieties are also propagated by suckers. In nurseries most of the varieties are propagated by grafting, either by budding in summer or by whip- or splice-grafting in spring outdoors or on potted stock in the greenhouse. *U. americana*, *U. campestris*, *U. foliacea*, and *U. glabra* are used for stocks.

KEY TO THE SPECIES.

- A. Blooming in spring, before the lvs.: calyx not divided below the middle.
 B. Fls. on slender pedicels, drooping: fr. ciliate.
 C. Fr. glabrous except the ciliate margin: branches not corky: margins of lvs. ciliate.
 D. Lvs. widest above the middle, densely pubescent beneath: buds elongated, pointed..... 1. *laevis*
 DD. Lvs. widest about the middle, more or less pubescent beneath: buds ovoid, obtusish or acute. 2. *americana*

- CC. Fr. pubescent: branches usually more or less corky.
 D. Margin of lvs. not ciliate; lvs. about 3 in. long, without axillary tufts beneath: buds pubescent..... 3. *racemosa*
 DD. Margin of lvs. minutely ciliate; lvs. about 2 in. long, with axillary tufts beneath: buds glabrous..... 4. *alata*
 BB. Fls. short-pedicelled, in dense clusters, not pendulous.
 C. Buds covered with rusty hairs, obtuse: branchlets scabrous with minute tubercles: lvs. ciliate: fr. pubescent in the middle..... 5. *fulva*
 CC. Buds pale pubescent or glabrous: branchlets smooth: lvs. not ciliate: fr. glabrous.
 D. Lvs. doubly serrate, unequal at the base, 2-7 in. long.
 E. Young branchlets pubescent: lvs. scabrous above.
 F. Fr. with the seed in the center, about $\frac{1}{4}$ in. broad: petioles short, about $\frac{1}{2}$ in. long.
 G. Mature branchlets reddish brown, hairy while young: lvs. only occasionally 3-lobed... 6. *glabra*
 GG. Mature branchlets pale yellowish or grayish brown, glabrous or nearly so while young: lvs. usually 3-lobed at the apex 7. *laciniata*
 FF. Fr. with the seed near the apex, $\frac{1}{2}$ in. broad or less: petioles $\frac{1}{6}$ - $\frac{1}{4}$ in. long.
 G. Lvs. broadly oval or ovate, 2-3 in. long: branchlets not corky... 8. *campestris*
 GG. Lvs. obovate or elliptic, 3-4 in. long: branchlets often with corky wings. 9. *japonica*
 EE. Young branchlets glabrous or with few scattered hairs: lvs. smooth or nearly so above: fr. with the seed above the middle.
 F. Length of lvs. 3-5 in.; petioles $\frac{1}{4}$ - $\frac{1}{2}$ in. long... 10. *hollandica*
 FF. Length of lvs. 2-3 $\frac{1}{2}$ in.; petioles $\frac{1}{4}$ - $\frac{1}{2}$ in. long... 11. *foliacea*
 DD. Lvs. simply serrate, nearly equal at the base, 1-2 in. long. 12. *pumila*
 AA. Blooming in the axils of this year's lvs. in summer or autumn: calyx divided below the middle.
 B. Lvs. simply serrate, small: fr. glabrous..... 13. *parvifolia*
 BB. Lvs. doubly serrate: fr. pubescent.
 C. Racemes 3-5-fl.: lvs. 1-2 in. long, obtuse or acute..... 14. *crassifolia*
 CC. Racemes many-fl.: lvs. 2-3 in. long, acuminate..... 15. *serotina*

1. *laevis*, Pall. (*U. pedunculata*, Foug. *U. effusa*, Willd. *U. ciliata*, Ehrh. *U. racemosa*, Borkh., not Thomas). Tree, attaining 100 ft., with spreading branches, forming a broad open head: branchlets pubescent, usually until the second year: buds glabrous, acute: lvs. oval or obovate, very unequal at base, acuminate, sharply doubly serrate, usually glabrous above, pubescent beneath, 2-4 in. long: fls. slender-pedicelled; calyx with 6-8 exerted stamens: fr. ovate, notched, the incision not reaching the outlet. Cent. Eu. to W. Asia. H.W. 2:39, p. 9. I.T. 6:220. R.F.G. 12:666.—Rarely cult., and with less valuable wood. The trunk and the limbs are, as in the American elm, often clothed with short branchlets.

2. *americana*, Linn. (*U. alba*, Raf.). WHITE ELM. WATER ELM. AMERICAN ELM. Figs. 3877, 3878, 3879.

Tall and wide-spreading tree, attaining to 120 ft., usually with high light gray trunk, limbs gradually outward-curving with pendulous branches: branchlets pubescent when young, glabrous in fall: buds acutish, glabrous: lvs. ovate-oblong, unequal at the base, acuminate, doubly serrate, pubescent when young, at length glabrous and rough above, pubescent or almost glabrous beneath, 3–6 in. long: fls. in many-fl. clusters; stamens 7–8, exserted: fr. oval or elliptic, veined,

3878. *Ulmus americana*. ($\times \frac{1}{4}$)

deeply notched, incision reaching to the nutlet. Newfoundland to Fla., west to the base of the Rocky Mts. S.S. 7:311. Em. 2:322. G.F. 3:443, 467; 6:175. Mn. 7, p. 125; 8, p. 71. F.E. 15:86, pl. 46. F.S.R. 1, p. 195. V. 14:79; 20:10. M.D.G. 1900:392–4.—One of the favorite avenue trees in the northeastern states. The elm varies considerably in habit, and the following forms have been distinguished. In the “vase form” the main trunk separates at 15–30 ft. into several almost equal branches, which diverge at first slightly and gradually, but at the height of 50–70 ft. sweep boldly outward and form a broad flat head, with the branches drooping at the extremities. This is the most beautiful and also the commonest form. The “plume form” is much like the foregoing, but the trunk is less divided and the limbs are clothed with short branchlets, thus forming feathery plumes. The “weeping-willow form” usually has a rather short trunk with limbs curving outward more rapidly and with long and very slender pendulous branches, forming usually a broad and round head. The “oak-tree form” is distinguished by its limbs spreading abruptly and in sharp turns and the branches being usually less pendulous. The name “feathery” or “fringed” elm is applied to trees which have the limbs and the main trunk clothed with short somewhat pendent branchlets thrown out usually in clusters at short intervals. This may appear in any of the forms named, but is most conspicuous in trees of the plume form. (Fig. 3879.) There are a few named varieties in nurseries: Var. *aurea*, Temple, with yellow foliage, found in Vt., by F. L. Temple; var. *pendula*, Ait., with slender pendulous branches; this is the “weeping-willow form” described above.

3. *racemosa*, Thomas, not Borkh. (*U. Thomasi*, Sarg.). CORK ELM. ROCK ELM. Fig. 3877. Tree, attaining 100 ft., with short spreading branches, forming an oblong round-topped head: branchlets pubescent usually until the second year and mostly irregularly corky winged when older: buds acute, pubescent: lvs. oval to oblong-obovate, unequal at the base, shortly acuminate, sharply and doubly serrate, glabrous or somewhat rough above, pubescent beneath, 2–4 in. long: fls. in slender pendulous racemes; calyx with 5–8 exserted stamens: fr. oval or obovate, with a shallow notch at the apex, pale, pubescent, $\frac{1}{2}$ – $\frac{3}{4}$ in. long. Que. to Tenn., west to Neb. S.S. 7:312.

4. *alata*, Michx. WAHOO or WINGED ELM. Fig. 3877. Tree, attaining 50 ft., with spreading branches forming an oblong, round-topped or rather open head: branches

usually with 2 opposite very broad wings; branchlets almost glabrous: buds acute, glabrous: lvs. ovate-oblong to oblong-lanceolate, often falcate, acute or acuminate, doubly serrate, subcoriaceous, glabrous above, pubescent beneath, $1\frac{1}{2}$ – $2\frac{1}{2}$ in. long: fls. in short, few-fl. racemes; stamens usually 5: fr. elliptic-ovate, with narrow wing and with 2 incurved horns at the apex, villous, $\frac{1}{2}$ in. across. Va. to Fla., west to Ill. and Texas. S.S. 7:313.—Handsome round-headed tree, sometimes used as an avenue tree in the southern states; not hardy N.

5. *fulva*, Michx. (*U. rubra*, Michx. *U. elliptica*, Hort., not Koch. *U. Heyderi*, Spaeth. *U. sibirica*, Hort.). SLIPPERY ELM. RED ELM. Figs. 3877, 3880. Tree, attaining 70 ft., with spreading branches, forming usually a broad, open, flat-topped head: branchlets pubescent and scabrous with minute tubercles: lvs. obovate to oblong, very unequal at base, long-acuminate, doubly serrate, of firm texture, very rough above, pubescent beneath, 4–7 in. long: fls. in dense clusters; stamens 5–9: fr. orbicular-oval, little notched at the apex, $\frac{1}{2}$ in. across. Que. to Fla., west to Dakotas and Texas. S.S. 7:314. Em. 2:

334.—The reddish brown pubescence of the bud-scales is very conspicuous in spring, when the buds are unfolding.

6. *glabra*, Huds. (*U. scabra*, Mill. *U. montana*, With.). WYCH ELM. SCOTCH ELM. Fig. 3877. Tree, to 120 ft., with spreading branches forming an oblong or broad round-topped head; without suckers: bark remaining smooth for many years (hence its Latin specific name): branches never with corky wings; young branchlets pubescent: buds obtuse, ciliate, and pubescent with yellowish brown hairs: lvs. very short-petioled and unequal at base, broadly obovate to oblong-obovate, abruptly acuminate or sometimes 3-lobed at the apex, sharply and doubly serrate, rough above, pubescent beneath, 3–6 in. long: fls. clustered; stamens 5–6, little exserted: fr. oval or roundish obovate, little notched at the apex, with the seed in the middle, $\frac{3}{4}$ –1 in. long. Eu. to Japan. H.W. 2:38, pp. 7, 8. F.S.R. 3, pp. 269, 271, 272. G.C. III. 39:152, suppl. S.E.B. 8:1287.—A variable species of which many forms are cult.: Var. *grandidentata*, Moss (*U. scabra tricuspidis*, Koch. *U. triserrata* or *tridens*, Hort.). Lvs. 3-lobed at the apex, particularly on vigorous shoots: young branchlets pubescent, reddish brown in autumn. Var. *crispa*, Rehd. (*U. montana crispa*, Loud. *U. crispa*, Willd. *U. asplenifolia*, Hort.). Slow-growing form with narrow lvs. incisely serrate with incurved twisted teeth. Var. *atropurpurea*, Rehd. (*U. montana atropurpurea*, Spaeth). Lvs. dark purple and folded. Var. *lutescens*, Rehd. (*U. montana lutescens*, Dipp.). Lvs. yellow. Var. *rubra*, Rehd. (*U. campestris rubra*, Simon-Louis. *U. montana libro rubro*, Planch.). Inner bark of the young branchlets deep red. Var. *fastigiata*, Rehd. (*U. montana fastigiata*, Loud. *U. pyramidalis*, Hort. *U. plumosa pyramidalis*, Hort. *U. exoniensis*, Hort. *U. Fordii*, Hort.). Columnar form with strictly upright branches: lvs. rather small, dark green, obovate, wrinkled above and somewhat twisted. Var. *pendula*, Rehd. (*U. montana pendula*, Loud. *U. montana horizontalis*, Kirchn.). Branches horizontally spreading forming a flat-topped head, branchlets pendulous. Gn. 17, p. 539; 77, p. 385. G.C. III. 50:221. M.D.G. 1901: 163. G.M. 49:749. G.L. 20:431. Var. *Camperdownii*, Rehd. (*U. Camperdownii*, Hort. *U. montana pendula Camperdownii*, Henry. *U. montana pendula*, Hort., not Loud.). CAMPERDOWN ELM. Figs. 3881, 3882. Branches and branchlets pendulous, forming a round head. Gn. 40, p. 158. G.C. III. 50:221. G.W. 2, p. 33; 8, p. 352; 15, p. 662. Var. *nana*, Rehd. (*U. montana nana*, Simon-Louis). Dwarf slow-growing form with

horizontal branches, stunted branchlets, and small lvs., forming a hemispherical bush. Forms of *U. glabra* are frequently planted in the East.

7. *laciniata*, Mayr (*U. montana* var. *laciniata*, Trautv. *U. major* var. *heterophylla*, Maxim.). Tree, usually not exceeding 30 ft., but occasionally taller: branchlets sparingly hairy or glabrous, finally pale yellowish brown or grayish brown, older branches brown: lvs. obovate or obovate-oblong, at the broad apex usually with 3, sometimes with 5 lobes, very unequal and semi-cordate at the base, doubly serrate, rough above, pubescent beneath at least on the veins, 3-7 in. long; petioles pubescent, very short, about $\frac{1}{2}$ in. long; fls. in clusters, short-stalked: fr. elliptic, glabrous, $\frac{3}{4}$ in. long, with the seed in the middle. Manchuria, N. China, Japan. S.I.F. 2:15.—This species has been sometimes confused with *U. glabra* var. *grandidentata*, but is easily distinguished by the pale color of the mature branchlets glabrous or slightly pubescent while young and by the presence of 3-lobed lvs. even on the fruiting branchlets of mature trees, while in the variety of *U. glabra* the mature branchlets are reddish brown and quite hairy while young and the 3-lobed lvs. appear chiefly on vigorous shoots.

8. *campéstris*, Linn. (*U. procera*, Salisb. *U. sativa*, Mill., according to Henry. *U. suberosa*, Smith. *U. surculosa* var. *latifolia*, Stokes). ENGLISH ELM. Tall tree, to 130 ft. high, with a straight st. and spreading or ascending branches forming an oval head; usually suckering abundantly: bark deeply fissured: young branchlets pubescent: buds ovoid, minutely pubescent: lvs. broadly oval or ovate, short-acuminate, very oblique at the base, dark green and scabrous above, soft-pubescent beneath and with axillary tufts of hairs, 2-3 in. long; pairs of veins about 12; petioles $\frac{1}{2}$ in. long, pubescent: fls. short-stalked with 3-5 stamens: fr. nearly orbicular, $\frac{1}{2}$ in. across, with a short closed notch at the apex, seed touching the base of the notch. England, W. and S. Eu. F.S.R. 2, p. 267. S.E.B. 8:1285. Em. 2:336. M.D.G. 1900:577.—This is the most stately of the European elms and much planted in England; the famous "Long Walk" in Windsor Park consists of this elm. This tree is sometimes planted as an avenue tree in this country; it succeeds very well and fine old trees may be seen occasionally in the north-eastern states. The foliage remains green several weeks longer than that of the American elm. The form of S. Eu. has been distinguished as var. *australis*, Henry. Pyramidal tree: lvs. thicker and firmer; more cuspidate-acuminate, with the veins more prominent beneath: fr. more obovate. There are also several garden forms. Var. *variegata*, Dipp. (var. *argenteo-variegata*, Hort.). Lvs. striped and spotted with white. Var. *purpurea*, Kirchn.

Lvs. tinged purple, 2-2 $\frac{1}{2}$ in. long. Var. *purpurascens*, Schneid. (var. *myrtifolia purpurea*, L. de Smet). Lvs. tinged purplish, about 1 in. long. Var. *Van Houttei*, Schneid. (var. *Louis Van Houtte*). Lvs. tinged with yellow. Var. *Berardii*, Simon-Louis. Bushy tree or shrub with slender upright branches: lvs. oblong, with few coarse teeth, nearly glabrous, $\frac{1}{2}$ -1 in. long. Var. *viminialis*, Loud. (*U. antarctica*, Kirchn. *U. stricta*, Hort.). Tree with as-

cending branches and pendulous slightly pubescent branchlets: lvs. obovate to narrowly elliptic, incisely doubly serrate, acuminate, scabrous above and slightly pubescent beneath, 1-2 $\frac{1}{2}$ in. long. G.C. III. 51:236. Var. *viminialis aurea*, Henry (*U. Rosseelsii*, Koch. *U. campestris aurea*, Morr. Var. *antarctica aurea*, Nichols.). Like the preceding but with yellow

3880. Fruit of slippery elm.—*Ulmus fulva*. ($\times \frac{1}{2}$)

lvs. B.H. 16:19. I.H. 14:513. Var. *viminialis marginata*, Kirchn. (var. *viminialis variegata*, Nichols.). Like var. *viminialis*, but lvs. variegated with white. Var. *Wentworthii*, Schelle (*U. Wentworthii pendula*, Hort.). A form with pendulous branches.

9. *japonica*, Sarg. (*U. campestris* var. *japonica*, Rehd.). Tree, to 100 ft., with a broad head and often more or less pendulous branchlets: young branchlets densely pubescent and rough with minute tubercles, pale yellowish brown, sometimes developing corky ridges: lvs. obovate or elliptic, acuminate, oblique at the base, scabrous and hairy above, pubescent beneath with slight axillary tufts of hairs, 3-5 in. long; pairs of veins 12-16; petiole $\frac{1}{2}$ - $\frac{1}{4}$ in. long, densely pubescent: fls. nearly sessile, tetramerous: fr. obovate-oblong, about $\frac{3}{4}$ in. long, gradually narrowed toward the base, with an open notch at the apex; seed touching the notch. Japan, Manchuria, Amurland. G.F. 6:327. S.T.S. 2:101.—Intro. into the Arnold Arboretum in 1895; it has proved perfectly hardy there, grows rapidly, and promises to become a valuable ornamental tree.

10. *hollandica*, Mill. (*U. Dippeliana*, Schneid. *U. glabra* $\times$ *U. foliacea*). Under this name are united here a number of elms which are apparently hybrids between the Scotch elm and the smooth-leaved elm. They are more or less intermediate between the parents, in some forms resembling the first, in others the second parent. As the type of this collective group the following variety may stand, as it is probably not different from Miller's *U. hollandica*. Var. *major*, Rehd. (*U. major*, Smith. *U. scabra* var. *major*, Gürke. *U. campestris* var. *major*, Planch.). DUTCH ELM. Tree, to 100 ft. or more, with a short trunk and wide-spreading branches, suckering: bark of trunk deeply fissured: young branchlets glabrous or with few hairs: buds ovoid, minutely pubescent: lvs. broadly oval, acuminate; very unequal at the base, dark green, lustrous and nearly smooth above, sparingly and minutely pubescent and glandular beneath, with conspicuous axillary tufts, 3-5 in. long; pairs of veins 12-14; petiole $\frac{1}{4}$ in. or slightly longer: fls. mostly 4-merous: fr. oval-obovate, $\frac{3}{4}$ -1 in. long; seed touching the base of the notch. R.F.G. 12:665. Var. *vegeta*, Rehd. (*U. vegeta*, Lindl. *U. glabra* var. *vegeta*, Loud. *U. Huntingdonii*, Hort.). HUNTINGDON ELM. Tall tree with rough bark and forked st.; suckering: young branchlets stout, glabrous or sparingly hairy: lvs. oval, acuminate, very unequal at the base, smooth and glabrous above, glabrous below except small axillary

3879. A feathered elm.—*Ulmus americana*.

tufts, $3\frac{1}{2}$ –5 in. long; pairs of veins 14–18; petiole $\frac{1}{4}$ in. or slightly longer; fr. oval-obovate, with closed notch; seed above the center. Var. *péndula*, Rehd. (*U. Smithii*, Henry. *U. glabra* var. *péndula*, Loud.). DOWNTON ELM. Tree with ascending branches and long pendulous branchlets more or less pubescent when young; lvs. oval, firm, long-acuminate, very unequal at the base, glabrous and smooth above, sparingly pubescent beneath, about $3\frac{1}{2}$ in. long; petiole $\frac{1}{4}$ in. long, pubescent; stamens 3–5; fr. obovate, $\frac{3}{4}$ in. long, with open notch; seed above the center. Var. *bélgica*, Rehd. (*U. bélgica* Burgsd. *U. batavica*, Koch. *U. latifolia*, Poederle. *U. campestris* var. *latifolia*, Gillekens). BELGIAN ELM. Tall tree with a straight rough-barked st. and a broad crown: young branchlets more or less pubescent; lvs. obovate-elliptic, very oblique at the base, slightly scabrous above, soft-pubescent beneath, 3–5 in. long, with 14–18 pairs of veins; petioles $\frac{1}{4}$ – $\frac{1}{2}$ in. long; fr. nearly 1 in. with the seed slightly above the middle. Much planted in Belgium and Holland. Var. *Dumontii*, Rehd. (*U. bélgica* var. *Dumontii*, Henry. *U. campestris* var. *Dumontii*, Mott.). Similar to the preceding variety with more ascending branches forming a narrower more pyramidal head. Var. *Klémmer*, Rehd. (*U. campestris* var. *Klémmer*, Gillekens. *U. campestris* *Klémmeri*, Hort. *U. Klémmeri*, Spaeth). Tall tree with a smooth-barked st. and ascending branches forming a narrow pyramidal head: young branchlets with short hairs; lvs. ovate, short-acuminate, glabrous, but scabrous above, minutely pubescent beneath, about 3 in. long; pairs of veins about 12; fr. with the seed close to the notch at the apex. Tree of rapid growth much planted in Belgium. Var. *superba*, Rehd. (*U. montana superba*, Spaeth, also of Morr.? *U. superba*, Henry. *U. præstans*, Schoch). Narrow pyramidal tree with smooth bark and ascending branches: young branchlets glabrous; lvs. obovate or obovate-elliptic, very oblique at the base, glabrous and smooth above, glabrous below except small axillary tufts, with 15–18 pairs of veins, 3–5 in. long; petioles $\frac{1}{4}$ – $\frac{1}{2}$ in. long, sparingly pubescent; fls. 5-merous. Var. *Pitteursii*, Rehd. (*U. Pitteursii*, Kirchn. "Orme Pitteurs." Morr.). Vigorous-growing tree with large lvs. similar to *U. glabra*, to 8 in. long, broadly ovate, said to produce annual shoots to 9 ft. long. B.H. 2, pp. 133, 136.

11. *foliacea*, Gilib. (*U. nitens*, Moench. *U. glabra*, Mill., not Huds. *U. campestris* var. *lævis*, Spach. *U. campestris* var. *glabra*, Hartig. *U. surculosa* var. *glabra*, Stokes). SMOOTH-LEAVED ELM. Tree, with straight trunk, wide-spreading branches and usually

3881. Camperdown elm.—*Ulmus glabra* var. *Camperdownii*.

pendulous branchlets; suckering; bark gray, deeply fissured; young branchlets glabrous or nearly so; buds minutely pubescent; lvs. oval or obovate, acuminate, very unequal at the base, lustrous and smooth above, with white axillary tufts beneath and glandular, sparingly and minutely pubescent at first, doubly serrate,

not ciliate, $2\frac{3}{4}$ in. long; pairs of veins about 12; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. long; fls. 4–5-merous; fr. obovate, cuneate at the base, broad and rounded at the apex; the seed nearly touching the closed notch at the apex. Eu., N. Afr., W. Asia. S.E.B. 8:1286 (as *U. suberosa glabra*). R.F.G. 12:664. H.W. 2:37, p. 3 (as *U. campestris*).—A variable species with several geographical varieties and a number of garden forms. Var. *suberosa*, Rehd. (*U. suberosa*, Moench, not Ehrh.

3882. *Ulmus glabra* var. *Camperdownii*. ($\times \frac{1}{2}$)

U. campestris suberosa, Wahl.). Branches with corky wings. R.F.G. 12:663. Var. *propendens*, Rehd. (*U. glabra propendens*, Schneid. *U. microphylla pendula*, Hort. *U. suberosa pendula*, Hort.). With pendulous branchlets, and small lvs. about 1 in. long. M.D.G. 1901:166. Var. *italica*, Rehd. (*U. nitens* var. *italica*, Henry). Similar to the typical form, but lvs. more coriaceous, with 14–18 pairs of veins, quite glabrous at maturity except conspicuous axillary tufts beneath; petioles $\frac{1}{4}$ in. long. Italy, Spain, Portugal. Var. *umbraculifera*, Rehd. (*U. campestris umbraculifera*, Trautv. *U. densa*, Litwinow). Tree, with dense globose head, otherwise like the type. Persia, Armenia. Gt. 30:1034. M.D.G. 1900:579. M.D. 1910, pp. 72, 73. Var. *gracilis*, Rehd. (*U. campestris umbraculifera gracilis*, Spaeth). Similar to the preceding but with a more ovoid, not globose head, and smaller lvs. Var. *Kobpmannii*, Rehd. (*U. campestris Kobpmannii*, Hort. *U. Kobpmannii*, Spaeth). Closely allied to var. *umbraculifera*, but with a dense oval head: branchlets paler; lvs. ovate, $1\frac{1}{4}$ in. long. Var. *Ruepéllii*, Rehd. (*U. campestris Ruepéllii*, Spaeth). Similar to var. *umbraculifera*, but branchlets pubescent and branches slightly corky; lvs. rather small, scabrous above. Var. *stricta*, Rehd. (*U. stricta*, Lindl. *U. nitens* var. *stricta*, Henry. *U. campestris* var. *cornubiensis*, Loud.). CORNISH ELM. Narrow pyramidal tree with ascending branches: young branchlets often pubescent at the insertion of the lvs.; buds glabrous; lvs. obovate to oval, somewhat unequal at the base, $2\frac{1}{2}$ in. long, glabrous and smooth above; petioles $\frac{1}{4}$ in. long; fls. usually 4-merous; fr. $\frac{2}{3}$ in. long, narrower than in the type. S. W. England. Var. *Wheatleyi*, Rehd. (*U. nitens* var. *Wheatleyi*, Henry. *U. campestris Wheatleyi*, Simon-Louis. *U. sarriensis*, Lodd. *U. campestris monumentalis*, Hort., not Ruiz). WHEATLEY, JERSEY, or GUERNSEY ELM. Narrow pyramidal tree with ascending branches: lvs. similar to those of the preceding variety, but broader, with less conspicuous axillary tufts and glandular beneath and on the petiole. G.C. III. 41:150. M.D. 1910, p. 273. Var. *monumentalis*, Rehd. (*U. campestris monumentalis*, Ruiz). Columnar tree with few upright branches and numerous short branchlets: lvs. crowded, rather short-petioled, dark green and somewhat rough above. Var. *Dampieri*, Rehd. (*U. nitens* var. *Dampieri*, Henry. *U. campestris Dampieri*, Spaeth). Fastigiate tree, forming a narrow pyramidal head: lvs. crowded on short branchlets,

broadly ovate, 2-2½ in. long, glabrous. Var. *Wrèdei*, Rehd. (*U. campestris Dampieri Wrèdei*, Hort. *U. Wrèdei aurea*, Hort.). Like the preceding, but lvs. yellowish. M.D.G. 1898:160. Var. *péndula*, Rehd. (*U. nárens var. péndula*, Henry). With slender pendulous branches. Var. *Webbiána*, Rehd. (*U. campestris Webbiána*, Lee). Pyramidal tree with ascending branches: lvs. folded longitudinally. Var. *variegata*, Rehd. (*U. campestris variegata*, Dum.-Cours. *U. campestris var. argéteo-variegata*, Rehd.). Lvs. variegated with white, smooth above.

12. *pùmila*, Linn. (*U. microphylla*, Pers. *U. sibirica*, Hort.). Small tree or shrub, with slender pubescent, sometimes pendulous branches: lvs. oval-elliptic to elliptic-lanceolate, short-petioled, acute, firm, dark green and smooth above, pubescent when young beneath, ¾-3 in. long: fls. short-pedicelled; stamens 4-5, with violet anthers: fr. obovate, with the nutlet somewhat above the middle, incision at the apex reaching about half-way to the nutlet. Turkestan to Siberia and N. China. Gn. 65, p. 133.—A graceful small hardy tree. Var. *arborea*, Litwinow (*U. pinnatiramósa*, Dieck. *U. turkestanica*, Regel). Tree with long, pinnately branched shoots pubescent when young: lvs. oblong-lanceolate, 1-2½ in. long; petioles pubescent at first. Var. *péndula*, Hort. (*U. parvifolia péndula*, Hort. *Planera repens*, Hort.), has slender more pendulous branches.

13. *parvifolia*, Jacq. (*U. chinensis*, Pers.). CHINESE ELM. Half-evergreen small tree or shrub, with spreading pubescent branches: lvs. ovate to obovate or oblong, very short-petioled and little unequal at base, acute or obtusish, subcoriaceous, simply serrate, glabrous and glossy above, pubescent beneath when young, usually glabrous at length, ¾-2 in. long: fls. short-pedicelled, in clusters; stamens 4-5, much exserted: fr. oval to elliptic, notched at the apex, with the seed in the middle, ¼-½ in. long. July-Sept. N. China, Japan. S.I.F. 1:37. R.H. 1909, pp. 398, 399.—Has proved hardy near Boston. The recently described *U. Sieboldii*, Daveau, and *U. Shirasawana*, Daveau, are probably only forms of this species; they are said to differ in their deciduous lvs. and the former besides by the persistent deeply fissured bark, exfoliating in the other two species and the larger fr. exceeding ½ in. (B.S.D. 1914: 24, 25); the latter differs in the crenate-dentate lvs. with 8-10 pairs of veins and in the contracted fr. (B.S.D. 1914: 24; also S.I.F. 1:37 represents this form).

14. *crassifolia*, Nutt. CEDAR ELM. Tree, attaining 80 ft., with spreading limbs and slender, often pendulous branches, often furnished when older with 2 opposite corky wings: lvs. short-petioled, ovate to ovate-oblong, usually very unequal at the base, obtuse or acute, doubly and obtusely, sometimes almost simply serrate, subcoriaceous, somewhat rough and lustrous above, pubescent beneath, 1-2 in. long: fls. in 3-5-fld. very short racemes; stamens 5-8, little exserted: fr. oval-elliptic, pubescent, notched, ½ in. long. Aug. Miss. to Ark. and Texas. S.S. 7:315.—Tender N.

15. *serótina*, Sarg. Tree, with short spreading and pendulous branches, often furnished with irregular corky wings: lvs. oblong to obovate, unequal at the base, acuminate, doubly serrate, glabrous and lustrous above, pubescent on the veins beneath, 2-3 in. long: fls. in 1-1½ in.-long pendulous racemes; calyx 5-6-parted to the base: fr. elliptic, deeply notched, densely ciliate, ½ in. long. Sept. Tenn. to Ga.; sometimes planted in

avenues in Ga. (S.S. 14:718); has proved hardy at the Arnold Arboretum, Boston.

U. arbuscula, Wolf (*U. glabra* × *U. pumila*). Shrubby tree: lvs. elliptic to elliptic-oblong, doubly serrate, nearly equal at the base, ¾-3 in. long, on shoots to 6 in. long. Originated in St. Petersburg.

U. Bergmanniana, Schneid. Allied to *U. glabra*. Tree, to 50 ft.: branchlets glabrous: lvs. obovate-oblong to elliptic, acuminate, doubly serrate, glabrous, 2½-5 in. long; petioles very short: fr. roundish-obovate, glabrous, ¾-¾ in. long. Cent. China. Var. *lasiophylla*, Schneid. Lvs. pubescent beneath. W. China.—*U. Davidiana*, Planch. Allied to *U. japonica*. Medium-sized tree: young branchlets glabrous, later pale grayish brown or pale brown: lvs. short-petioled, obovate or elliptic ovate, doubly serrate, slightly pubescent beneath, 2-4½ in. long: fr. pubescent in the middle, but glabrous toward the margin. N. China.—*U. elliptica*, Koch. Allied to *U. glabra*. Branchlets pubescent: lvs. elliptic to elliptic-oblong, glabrous and nearly smooth above, slightly pubescent beneath, 3½-6 in. long: fr. obovate, with the seed in the pubescent middle. Transcaucasia, Armenia. The plant cult. under this name is *U. fulva*.—*U. Keckii*, Sieb.=Zelkova serrata.—*U. macrocarpa*, Hance. Small tree or shrub: young branchlets pubescent, later pale brown, often with 2 corky wings: lvs. ovate, coarsely doubly serrate, rough above, slightly pubescent or nearly glabrous below, 1½-3 in. long: fr. obovate, with the nutlet in the middle, pubescent and ciliate, about 1 in. long. N. China. Possibly *U. rotundifolia*, Carr. (R.H. 1868, p. 374), belongs here.—*U. minor*, Mill. (*U. surculosa* var. *argutifolia*, Stokes. *U. sativa*, Moss, not Mill. *U. Plotii*, Druce). Allied to *U. foliacea*. Suckering tree, to 90 ft., with ascending branches and pendulous branchlets: lvs. obovate or elliptic, dull and slightly scabrous above, pubescent beneath at first, 1½-2½ in. long; petioles ½ in. long: fr. narrowly obovate, ½ in. long. Eu. G.C. III. 50:408, 409; 51:235. R.F.G. 12:660.—*U. Plotii*, Druce=*U. minor*.—*U. sativa*, Moss=*U. minor*.—*U. Verschaffeltii*, Druce=Zelkova Verschaffeltii.—*U. Wilsoniana*, Schneid. Tree, to 50 ft.: young branchlets pubescent, later brown and often corky: lvs. elliptic or elliptic-obovate, doubly serrate, smooth above, finely pubescent or nearly glabrous beneath, 1½-4 in. long: fr. obovate with the nutlet near the apex, glabrous, about ¾ in. long. Cent. China.

ALFRED REHDER.

UMBELLULÀRIA (from Latin *umbella*, a sunshade; referring to form of inflorescence). *Laurææ*. CALIFORNIA LAUREL. Tall umbrageous tree, glabrous, used as a shade tree in California and similar regions.

Leaves alternate, evergreen, petioled, slightly coriaceous: fls. small, greenish,

3883. California laurel.—
Umbellularia californica.
(×¼)

in simple pedunculate umbels, which in the bud are surrounded by an involucre of 6 caducous bracts; perianth-tube very short; limb with 6 segms.; stamens 9, filaments with an orange-colored gland at base, anthers opening by uplifted valves: drupe subglobose or ovoid with a hard endocarp.—One species, Calif. Prop. by seeds.

californica, Nutt. (*Oreodaphne californica*, Nees). Fig. 3883. Handsome evergreen tree, 20-30 or even 80-90 ft. high, with erect or suberect slender branches, conical outline and dense foliage: lvs. containing a highly aromatic and volatile essential oil, and burning vigorously in the campfire, even while green: fls. fragrant: drupes at first yellowish green, becoming purple when ripe. Dec. to May.—One of the most abundant and characteristic of Californian trees, common in moist

places, particularly along streams in the Coast Range foothills and mountains, and attaining its greatest size in the cool fog-moistened alluvial valleys of the coast of N. Calif. and S. Ore.; it is but rarely seen in the drier interior valleys of the state. It often crowns the highest points of the coast-range hills, up to about 2,500 ft.

altitude and far from the nearest spring or other visible sign of moisture, but in such cases the rock strata are nearly vertical and easily penetrated by the long roots which are able thus to reach hidden supplies of water. In such places it usually forms dense clumps or thickets of shrubs or small trees which are frequently shorn by the cutting ocean winds as though by a gardener's shears, suggesting its adaptability for clipped-hedge and windbreak work. It is used in boat-building, for jaws, bits, cleats, cross-trees, and the like. The branches are occasionally used for poles for chicken-roosts, as the strong odor pervading wood and bark as well as lvs., is said to keep away lice. The lvs. are used for flavoring soups and blanch-manges but are too strong to give as agreeable flavor as those of *Laurus nobilis* or *Prunus Laurocerasus*. The tree is sometimes cult. for ornament in S. European parks and gardens. Sargent describes it as "one of the stateliest and most beautiful in-

habitants of the North American forests, and no evergreen tree of temperate regions surpasses it in the beauty of its dark dense crown of lustrous foliage and in the massiveness of habit which make it one of the most striking features of the California landscape and fit it to stand in any park or garden."

JOSEPH BURTT DAVY.
F. TRACY HUBBARD.†

UMBRELLA LEAF: *Diphyllia*. U. Pine: *Sciadopitys*. U. Plant or U. Palm: *Cyperus alternifolius*. U. Tree: *Melia Azedarach* var. *umbraculiformis*.

UMBILICUS: *Cotyledon*.

UNGNADIA (named for Baron Ungnad, who in 1576 introduced the common horse-chestnut to western Europe by sending seeds to Clusius at Vienna). *Sapindaceæ*. MEXICAN BUCKEYE. Small tree or shrub which has been grown abroad in the coolhouse, but is hardy in the S. U. S., where it is used as an ornamental. Lvs. alternate, without stipules, odd-pinnate; lfts. 3-7 pairs, serrate, terminal long-petioled; fls. polygamous, irregu-

lar, aggregated in lateral fascicle or corymbose; calyx subequal, campanulate, 4-5-parted, lobes imbricate; petals 4-5, subequal, clawed, apex connate-cristate; disk 1-sided, oblique, tongue-shaped; stamens 7-10, unequal in length; ovary stipitate, ovoid, 3-celled; caps. 3-lobed, loculicidally 3-valved, leathery, cells 1-seeded; seed emetic.—One species, Texas. The seed, or "bean," has a sweet taste, but is considered emetic and poisonous. The fr. does not have a prickly husk like the horse-chestnut.

speciosa, Endl. MEXICAN BUCKEYE. Commonly a slender deciduous shrub, 5-10 ft. high or sometimes a small tree: wood brittle: lvs. alternate, odd-pinnate; lfts. 5-7, ovate-lanceolate, acuminate. Common in S. W. Texas; winter-kills in N. Texas at a temperature of zero. S.S. 2:73. F.S. 10:1059. Gn. 19, p. 309. H.F. II. 7:231.—Intro. into Ga. at one period.

F. TRACY HUBBARD.†

UNIOLA (an ancient Latin name of some unknown plant, derived from *unio*, unity). *Gramineæ*. Perennials with loose usually showy panicles: spikelets broad and very flat, several-fld., some of the lower lemmas empty; glumes and lemmas keeled, nerved, pointed, but awnless.—Species 5, all American. Cult. for the ornamental panicles, which are suitable for dry bouquets.

latifolia, Michx. SPIKE-GRASS. Fig. 3884. Culms 2-4 ft.: lvs. broad and flat, often 1 in. wide: spikelets large and thin, at maturity drooping on slender pedicels, forming a very graceful and ornamental panicle. Pa. to Kans., and southward.—Often grown in hardy borders. One of the best of our hardy native perennial grasses.

paniculata, Linn. SEA OATS. Fig. 3885. Culm taller, 4-8 ft.: lvs. narrow and convolute: spikelets narrower, upright on short pedicels, forming an elongated drooping panicle. Sand-hills along the seashore of the southern states; can be grown as far north as S. Ont. Dept. Agr., Div. Agrost., 7:271.

U. Palmeri, Vasey, a dioecious perennial with extensive rootstocks, growing in sand-flats along rivers of N. Mex., is harvested by the Cocopa Indians who use the grain for food. G.F. 2:403.

A. S. HITCHCOCK.

UNONA (in imitation of *Anona*). *Annonaceæ*. A genus based by the younger Linnæus on an American plant belonging to the previously established genus *Xylopia*, and afterward incorrectly applied to the Old World genus *Desmos*, of which it becomes a synonym. *U. discolor*, Vahl, cult. in tropical gardens for its sweet-scented fls., is identical with the

3885. *Uniola paniculata*.

3884. *Uniola latifolia*. ($\times \frac{1}{4}$)

previously described *Desmos chinensis*, Lour.; *U. Désmos*, Dunal, is *D. cochinchinensis*, Lour. (see *Desmos*, in Vol. II). Belonging to other genera are Dunal's *U. uncinata*, which is the fragrant *Artobotrys odoratissimus* of the Orient; *U. violacea*, which is undoubtedly a species of carrion fls., *Sapranthus*, closely allied to *Sapranthus nicaraguensis*; *U. penduliflora*, which is the aromatic ear-flower, or xochinacaztli, of the Aztecs (*Cymbopetalum penduliflorum*, Baill.); and his *U. acutiflora* and *U. xylopioides* are both synonyms of the spicy *Xylopi grandiflora*, St. Hil. B. L. Robinson's *U. bibracteata*, the fragrant "flor de guineo", which ranges from Nicaragua to Panama, and his *U. panamensis* have been set apart by the writer under the generic name of *Desmopsis*. The latter has recently been rediscovered by Henry Pittier at its type locality in the Canal Zone. Both of the latter species are figured by the writer in the Bull. Torr. Bot. Club, vol. 43, pp. 183-93 (1916). See also W. E. Safford, Bull. Torr. Bot. Club. 39:501-8 (1912).

W. E. SAFFORD.

UPAS TREE: *Antiaris*.

URÀRIA (Greek *oura*, tail, referring to bracts). *Leguminosæ*. Subshrubby perennials, adapted to the warmhouse; 1 species has been tried in S. Fla. Lvs. pinnately 3-rarely 5-7-foliate or the lower rarely all 1-foliate; lfts. usually large, stipellate; stipules free, acuminate; fls. purplish or yellowish, arranged in terminal hirsute racemes, which are sometimes elongated, sometimes dense and spike-like; calyx-lobes subulate acuminate, 2 upper teeth short, 3 lower usually elongated; standard broad; wings adhering to the obtuse keel; stamens diadelphous; ovary sessile or stipitate, few-ovuled; pod of 2-6 small, turgid, 1-seeded indehiscent joints, often placed face to face.—About 17 species, Trop. Asia, Afr., and Austral.

crinita, Desv. Erect little-branched subshrubby perennial, 3-6 ft. high, distinguished from other species by having its upper lvs. composed of 3-7 oblong lfts. and pedicels clothed with long bristles: lfts. 4-6 x 1½-2 in.; racemes dense, 1 ft. long, 1-1½ in. thick; standard ovate, violet-purple within, pale blue outside; wings pinkish. Bengal to Assam, eastward through Burma to China, south to Malacca and the Malay Isls. to Timor Laut, but not Austral. and not indigenous in Ceylon. B.M. 7377.—Sometimes the raceme has 200 or more fls., each of which is ½ in. long.

F. TRACY HUBBARD.†

URBÍNIA (named for Dr. Manuel Urbina). *Crassulacæ*. Perennial succulent herbs, caulescent or acaulescent: lvs. closely imbricated, thick and rigid: infl. rather few-fld., cymose: calyx small, 5-lobed, lobes ovate to lanceolate, equal or unequal, much shorter than the corolla which is somewhat cone-shaped, lobes united at base into a tube; stamens 10, borne on the corolla; carpels 5. Three or 4 species, Mex. See also *Cotyledon*, Vol. II, p. 868. *U. obscura*, Rose. Caulescent: st. about 4 in. high: lvs. ovate, about 3 x 2 in., thick but flattened, somewhat rounded at base: fl.-sts. thickish, with many narrow lvs.: infl. a 2-branched raceme: fls. about 10; calyx-teeth lanceolate; corolla about ½ in. long, bright rose below, lobes slightly spreading, yellow. Habitat unknown. *U. Purpusii*, Rose. Acaulescent: lvs. forming a very compact rosette, broadly ovate, acuminate, 1¼ in. long and nearly as broad at the base, gla-

brous, mottled with brown: flowering st. reddish, nearly 1 ft. high, bearing numerous small, ovate, appressed lvs.: infl. about 6-fld., in a raceme: sepals green, ovate, acute; corolla somewhat urn-shaped, pinkish outside, pale yellow inside, petals acute. S. Mex.

F. TRACY HUBBARD.

URCEOCHARIS (from the genera *Urceolina* and *Eucharis*). *Amaryllidacæ*. A hybrid between *Urceolina pendula* and *Eucharis grandiflora*, or in gardener's language *Urceolina aurea* and *Eucharis amazonica*. A flower of the hybrid and of each of its parents is shown in Fig. 3886. It is a tender winter-blooming bulbous plant with broad lvs. a foot long and half as wide, and large white bell-shaped 6-lobed fls. a dozen or so in an umbel, and each 2 in. across. The hybrid gets its white color from *Eucharis*, the fls. of *Urceolina* being yellow. The shape of its fl. is so singular a mixture of the two as to be very different in appearance from either. The hybrid lacks the beautiful staminal cup of *Eucharis*, and has a distinctly bell-shaped perianth. The showy part of *Urceolina* is the urn-shaped portion of the fl., the spreading tips being very short. The perianth of *Eucharis* is funnelliform, the spreading portion being large and showy. The perianth-tube and ovary of the

3886. At the left, *Eucharis grandiflora*; middle, *Urceolina pendula*; at the right, the hybrid *Urceocharis Clibranii*. (All half size.)

hybrid are like those of *Urceolina*, the ovary being deeply 3-lobed instead of globose as in *Eucharis*. The pedicels are ascending, as in *Eucharis*, not pendulous as in *Urceolina*. The appendages at the base of the stamens are more distinctly marked than in either of the parents. This bigeneric hybrid was intro. to the trade under the name of *Eucharis Clibranii*, but the changes wrought in the structure of the fl. by the cross are so great that Dr. Masters was justified in giving the plant a new genus.

Clibranii, Mast. (*Eucharis Clibranii*, Hort.). Tender bulbous hybrid of *Urceolina pendula* and *Eucharis grandiflora*, with petioled lvs. 1 x 1½ ft. and umbels of white bell-shaped 6-lobed fls. each 2 in. across and a dozen in an umbel, anthers depauperate. Blooms in early winter. For cult., see *Urceolina*. G.C. III. 12:215; 26:251. Gn. 44, p. 459. G.M. 35:790. G. 16:450.—Intro. about 1892 by Messrs. Clibran, Oldfield Nurseries, Altrincham, England.

edentata, C. H. Wright. From Peru, described from a plant that bloomed in the establishment of Sander & Sons, supposed to be a natural hybrid between an *Urceolina* and a *Eucharis*; differs from *U. Clibranii* in having no teeth on the corona between the filaments. B.M. 8359.

WILHELM MILLER.
L. H. B.†

URCEOLINA (Latin, *small pitcher*, alluding to the pitcher- or urn-shaped flowers). *Amaryllidaceæ*. Bulbous herbs, used both in the greenhouse and for summer and autumn blooming out-of-doors.

Scape solid: lvs. flat, ovate, oblong or narrow, contracted to the petiole: fls. in an umbel, numerous, rather long-pedicelled; involucre bracts 2, scarious; perianth erect, finally recurved or pendulous, tube contracted above the ovary, then suddenly dilated, lobes subequal, spreading; ovary 3-celled; caps. ovoid-globose or subpyramidal, 3-angled or nearly 3-lobed.—About 3 species, S. Amer.

The species of urceolina are attractive plants and easily grown, flowering every year, but for some reason they are rather scarce. The bulbs are about 3 inches across and during the growing season have one or two leaves. The plants flower in December. After flowering the bulbs may be removed from the warmhouse to the intermediate house and placed in a spot where they will be kept dry. Just before growth begins in the spring, the bulbs should be taken out of the pots and the exhausted soil removed. The bulbs may then be replaced, one bulb in a 5-inch pot, using clean pots, plenty of drainage material and a rich light porous soil. Place the top of the bulb level with the soil. Remove the pots to the stove, and as soon as growth begins water freely. In the fall when the leaves turn yellow, water sparingly and finally withhold water altogether. The flower-scapes appear a few weeks after the leaves disappear. (Robert Cameron.)

A. Fls. red.

miniata, Benth. & Hook. (*Penillandia miniata*, Herb.). Bulb about 1½ in. through: lvs. produced after the fls., short-petioled, about 1 ft. long, 1½ in. wide, narrowed at both ends: scape over 1 ft. long: fls. 2-6, bright scarlet. Andes of Peru and Bolivia. B.R. 25:68. R.B. 23:49.—Offered by Dutch bulb-growers.

AA. Fls. yellow.

péndula, Herb. (*U. aurea*, Lindl.). Bulb about 1½ in. through: lvs. 1-2 to a st., produced after the fls., oblong, acute, 1 ft. long by 4-5 in. broad: scape about 1 ft. long: fls. 4-6, bright yellow tipped with green. Andes of Peru. B.M. 5464. G.C. III. 12:211. G. 32:241. J.H. III. 48:445.

F. W. BARCLAY.

F. TRACY HUBBARD.†

URECHITES (tailed *Echites*, alluding to the appendages of the corolla). *Apocynaceæ*. Prostrate plants or twining vines, allied to *Dipladenia* and having similar cultural requirements. Sts. woody or nearly so: lvs. opposite, the blades entire: fls. often showy, in axillary or terminal cymes or racemes, or sometimes only 2 together; calyx-lobes 5, long and narrow; corolla funnel-shaped, rather large, abruptly widened into a throat, 5-lobed, the lobes sometimes elongated and twisted; stamens inserted at top of the corolla-tube and included in the throat, the anthers sagittate; disk cup-shaped, 5-lobed or nearly entire; fr. comprised of 2 long spreading follicles. Species about 10, in Trop. Amer. and extending into Fla. *U. suberecta*, Muell. Arg., of Colombia, is sometimes grown in the warmhouse: somewhat woody and partially erect: lvs. ovate to elliptic: fls. large, yellow, in a terminal peduncled cyme. B.M. 1064 (as *Echites suberecta*), and 4702 (as *Dipladenia flava*).

URÈNA (from Uren, the Malabar name). *Malvaceæ*. Herbs or subshrubs of little horticultural interest: plants more or less covered with rigid stellate hairs: lvs. angled or lobed: fls. clustered; calyx 5-cleft; petals 5, often tomentose at the back, free above, connate below; staminal tube truncate or minutely toothed, anthers nearly sessile; ovary 5-celled, cells 1-ovuled: ripe carpels covered with hooked bristles or smooth, indehiscent.—About 8 or 9 species, natives of the

tropics and subtropics. *U. lobata*, Linn. Herbaceous, more or less hairy: lvs. rounded, angled, not divided beyond the middle, cordate, 5-7-lobed, lobes acute or obtuse, about 1-2 x 2-3 in.: fls. pink: carpels densely pubescent, spiny. Tropics of both hemispheres. Very variable. *U. stellipila*, Lem. Shrubby with a few elongated, fulvous-pilose branches: lvs. distant, rather short-petioled, cuneately ovate-lanceolate, base somewhat cordate, stellate, hairy, coarsely crenulate-dentate: fls. rather large, 1½ in. across, white, in axillary clusters; calyx-segms. lanceolate, acute; petals spatulate. Brazil. J.F. 3:281.

URÈRA (derivation not obvious, possibly from *uro*, to burn, alluding to the stinging hairs). *Urticaceæ*. Trees or shrubs, rarely subshrubs, with stinging hairs usually scattered, one of which has been rarely cult. as an ornamental greenhouse shrub. Lvs. alternate, entire, dentate or lobed, feather-veined or 3-5-nerved; stipules free or more or less connate in one: panicles dichotomous, cymose or irregularly racemose, unisexual: fls. dioecious or rarely monœcious; perianth of male fls. 4-5-parted, segms. ovate, stamens 4-5, ovary rudimentary; perianth-lobes or segms of female fls. 4, subequal or outer smaller, ovary straight or oblique: achenium straight or oblique, compressed or ventricose.—About 40 species, Trop. Amer., Afr., also Mascarene Isls. and Pacific islands.

alceæfölia, Gaud. (*Urtica caracasana*, Jacq.). Tree or shrub: lvs. broadly ovate, acuminate, basal sinus wide and open, crenate-dentate: fls. dioecious, in regularly dichotomous cymes; male cymes 4-6 times dichotomous, stinging or not, rose-colored; female fls. many times dichotomous, the fls. solitary or in 3's. Trop. Amer.

F. TRACY HUBBARD.†

URGINEA (from the name of an Arabian tribe in Algeria). *Liliaceæ*. Bulbous herbs used both in the greenhouse and out-of-doors.

Leaves radical, sometimes very narrowly linear, sometimes broadly strap-shaped or almost oblong: scape simple, leafless: fls. in a terminal raceme, usually numerous, rather small or medium-sized, whitish, or rarely pale yellowish or rose, color more intense in the center of the segms.; bracts small, scarious; perianth finally deciduous, segms. 6, distinct, campanulate-connivent or spreading after anthesis; stamens 6; ovary sessile, 3-celled, usually 3-cornered: caps. 3-cornered, grooved, or intruded between the angles, loculicidally dehiscent.—About 75 species, Eu., Medit. region, India and Trop. and S. Afr. The sea-onion is closely related to the genus *Scilla*, but seems to be much closer to *Ornithogalum*, especially in habit, infl. and color of fls. The seeds of *Urginea* are numerous in each locule (in the sea-onion 10-12), strongly compressed and winged; in *Ornithogalum* and *Scilla* they are not compressed or winged and in *Scilla* they are solitary or few in each locule.

The sea-onion, known to apothecaries by the name of squill, and to gardens as *Urginea maritima*, is a bulbous plant native to the Mediterranean region. It has the same style of beauty as *Ornithogalum pyramidale* but unfortunately it is only half-hardy. As an ornamental plant it is little known in America. The name seems not to appear in American catalogues, but the Dutch bulb-growers offer the bulbs in different sizes. A plant erroneously called sea-onion is *Ornithogalum caudatum*. There is considerable difference of opinion as to when the sea-onion blooms, but the plant is generally considered an autumn bloomer, and it is clear that the leaves appear after the flowers. In England the plant is said to have flowered as early as July and August. Baker writes that the leaves appear in winter. Some English cultivators say the leaves appear as early as October and November; others say not until spring.

The plant grows near the seashore and inland, in dry sandy places from the Canaries to Syria. It is also found in South Africa, which is unusual, as the North and South African species of any genus are not usually identical.

The bulbs of *Urginea* are collected in large quantities in the Mediterranean region for the drug trade. They sometimes attain a maximum weight of fifteen pounds. The bulbs contain about 22 per cent of sugar and are used in Sicily in the manufacture of whiskey. Squills have emetic and cathartic properties. Sirup of squills is a popular croup medicine. The bulb, as it appears in the wholesale drug market, has been deprived of its outer scales and cut into thin slices, the central portions being rejected.

Scilla, Steinh. (*U. maritima*, Baker). SEA-ONION. SQUILL. Height 1-3 ft.: bulb 4-6 in. thick: lvs. appearing after the fls., lanceolate, somewhat fleshy and glaucous, glabrous, 1-1½ ft. long, 2-4 in. wide above middle: racemes 1-1½ ft. long, 1-1½ in. wide, 50-100-flid.: fls. ½ in. across, whitish, with the oblong segms. keeled, greenish purple. Autumn. Canaries to Syria, S. Afr. B.M. 918 (as *Ornithogalum Squilla*).—In Italy it is said to be seen often blooming in many houses on top of shelves or cupboards, the bulbs producing their long spikes of fls., which last in perfection for weeks, without earth or water.

WILHELM MILLER.

F. TRACY HUBBARD.†

UROSTÍGMA: *Ficus*. The following species now in cult. abroad was not included under *Ficus* in Vol. III, p. 1229. *Ficus subtripplinervia*, Mart. (*Urostigma subtripplinervium*, Miq.). Large tree: lvs. chartaceous, ovate- or lanceolate-elliptic or oblong, 1-2 x ½ in.: fls. in axillary pairs, very short-peduncled, dicæious. Brazil.

URSÍNIA (John Ursinus, of Regensburg, 1608-1666; author of "Arboretum Biblicum"). *Compositæ*. Here belongs the hardy annual known to the trade as *Sphenogyne speciosa*.

Annuals, perennials, or subshrubs: lvs. alternate, serrate, pinnatifid or usually pinnatisect: rays the same color on both sides or purplish brown beneath; involucre hemispherical or broadly campanulate: achenes often 10-ribbed.—A genus of about 60 species, all native to S. Afr. One species, *U. annua*, is also found in Abyssinia. In *Flora Capensis*, vol. 3 (1864-65), *Sphenogyne* and *Ursinia* are treated as separate genera, the distinctions being as follows: the achene is cylindrical in *Sphenogyne*, but obovate or pear-shaped in *Ursinia*, distinctly tapering to the base: the pappus is uniseriate in the former, biseriate in the latter, the inner series consisting of 5 slender white bristles. In the course of time these distinctions have been dropped and *Sphenogyne* included in *Ursinia*.

púlchra, N. E. Br. (*Sphenogyne speciosa*, Knowles & Westc.). Fig. 3887. Annual, 1-2 ft. high, with lvs. bipinnately dissected into linear lobes and yellow or orange fl.-heads 2 in. across: rays about 22, 3-toothed, spotted purple-brown at base: st. glabrous, branched: lvs. alternate: scapes nearly leafless, about 5 times as long as lvs.: involucre 4-rowed; scales increasing in size from the base, outer rows with a brown scarious border, inner with a white scarious border. F.C. 2:77. P.M. 6:77. G.C. III. 4:356. Gn. 44, p. 217. R.H. 1843:445. G. 16:352. J.H. III. 54:85.—Both yellow and orange-colored fls. are sometimes found on the same plant. When well managed it blooms all summer. It is a native of the Cape region of S. Afr. It has been in cult. since 1836 but was not correctly described until 1887. It is much praised by connoisseurs, though it is not known to the general public. It seems to have enjoyed a longer continuous period of cult. than many other showy composites, in which the Cape is wonderfully rich.

WILHELM MILLER.

URTICA (classical name, alluding to the burning hairs). *Urticacæ*. NETTLE. About 30 annual and perennial erect simple or branching slender herbs, widely distributed, little if at all planted because of the stinging hairs and sts. and lvs.: fls. small, greenish and inconspicuous, racemose, spicate or clustered in the axils, monœcious or dicæious, sometimes hermaphrodite; sterile fls. with 4 sepals and 4 stamens; fertile fls. with 2 pairs of sepals and a single erect ovary: lvs. simple, opposite, strongly nerved, dentate or crenate or incised. Several species of nettle are native in N. Amer. and a few are intro. weeds. The plants have very little ornamental value.

3887. *Ursinia pulchra*. (×¼)

URVÍLLEA (bears the name of Capt. Dumont D'Urville, French botanist and naval officer). *Sapindacæ*. About a dozen species of climbing shrubs of Trop. Amer. Lvs. alternate, ternate, the lfts. entire or coarsely dentate and more or less pellucid-dotted: fls. whitish, on jointed pedicels, in axillary racemes, the peduncles ending in a pair of tendrils; sepals 5, the 2 outer ones smaller; petals 4; disk of 4 glands; stamens 8: fr. a 3-winged samara. Probably no species is in cult., the *U. ferruginea*, Lindl., of lists being *Serjania cuspidata*.

UTRICULARIA (Latin, a little bag or skin, referring to the bladders). *Lentibulariæ*. BLADDERWORT. As known to gardeners, the bladderworts are of two rather distinct groups,—the aquatic mostly native kinds sometimes used in pools and aquaria, and the tropical terrestrial kinds sometimes grown in warm-houses with orchids and other special plants. The whole group is of little importance horticulturally.

As commonly understood, *Utricularia* is a genus of some 200 aquatic and terrestrial herbs, of cosmopolitan distribution. Recently, however, the genus has been split into several genera, and the name *Utricularia* retained for certain aquatic species; with this taxonomic innovation, however, we are not concerned in this brief account. Under the older and prevailing definition,

Utricularia comprises plants with numerous slender wiry scapes bearing one or many fls.: calyx large, 2-parted or 2-lobed; corolla with a spur which is usually long and curved under the fl.; posterior lip erect, entire, emarginate or 2-fid; anterior lip often large, broad, and showy, spreading or reflexed, entire, crenate or 3-lobed, or the middle lobe various: lvs. of the aquatic species much dissected, sometimes disappearing at flowering-time, very delicate: plant floating or rooting in the mud, the lvs., branches, and sometimes the roots bearing minute bladders; lvs. of terrestrial species linear or spatulate and rosulate at base of plant. The bladders trap small aquatic animals. These bladders have a valve-like door through which the animals enter when

3888. *Utricularia longifolia*. ($\times \frac{1}{4}$)

looking for food or when trying to escape from other creatures; they are most numerous and effective in the species which float in stagnant water. They are fewer in the marsh-inhabiting species. The terrestrial kinds often have minute deformed and useless bladders; these kinds are common in the tropics and are characterized by erect foliage of the ordinary type. These often form little tubers by which they may be propagated. The native aquatic species propagate themselves by seeds and also by winter buds. (A winter bud of another aquatic plant is figured under *Elodea*, p. 1110). Some of the utricularias are epiphytic in a way. Those who are familiar with bromeliaceous plants know how the water gathers in the axils of the lvs. These bromeliads are themselves often epiphytic, perching on high trees in moisture-laden tropical jungles. In the miniature ponds supplied by the lf.-axils of *Vriesia* and other bromeliads live certain utricularias with fully developed and effective bladders. Occasionally they send out a long "feeler" or runner-like shoot which finds another bromeliad and propagates another bladderwort.

The aquatic utricularias are sometimes cultivated in aquaria, but their flowers are not showy, nor are those of any of the hardy kinds. A number of them are native in lakes and ponds in the United States and Canada. The showy species are the terrestrial and epiphytic kinds of the tropics. These, for complexity of floral

structure, beauty of color and lasting qualities, vie with certain orchids. In fact, they are usually grown by orchid-lovers in orchid-houses. Perhaps the most desirable of the genus are *U. montana*, *U. Endresii*, and *U. longifolia*, each of which represents a different color. Well-grown baskets of these plants have numerous scapes a foot or so high bearing five to twenty flowers, each $1\frac{1}{2}$ to 2 inches across. In general, such plants are grown in warmhouses, *U. Endresii* requiring a stove temperature, while some of the others may thrive in an intermediate house. As a class they are grown in baskets, near the light, using a compost of fibrous peat and sand. The plants are kept constantly wet during the growing season and until the flowers are gone. During the winter they are rested, being kept in a cooler place and given just enough water to keep the tubers from shriveling.

INDEX.

<i>americana</i> , 1.	<i>janthina</i> , 5.	<i>montana</i> , 3.

<i>Forgetiana</i> , 9.	<i>macrorrhiza</i> , 1.	<i>vulgaris</i> , 1.
<i>Humboldtii</i> , 7.	<i>major</i> , 8.	

A. *Habit aquatic.*

B. *Foliage dissected into numerous thread-like segms.; lvs. floating.*

1. *vulgaris*, Linn. Hardy aquatic: sts. a few inches to 3 ft. long, with crowded 2-3 pinnately divided floating lvs. $\frac{1}{2}$ -1 in. long, provided with numerous bladders and yellow fls. $\frac{1}{2}$ in. long or more, borne in few-fl. racemes: scapes 6-8 in. high: corolla closed, with reflexed sides and a conical blunt spur. Eurasia, in ponds and channels. Gn. 28, p. 403.—Sometimes listed among aquatic plants. What is considered by some to be the same species occurs far northward in N. Amer.; represented in the U. S. by var. *americana*, Gray, with a more slender and rather acute spur. Some authors consider the American plant to be distinct, and it then takes the name *U. macrorrhiza*, LeConte, distinguished from the Eurasian material by longer sts., shape and direction of spur and reduced or rudimentary stolons. Sometimes collected for aquaria.

BB. *Foliage ribbon-like.*

2. *prehensilis*, E. Mey. An aquatic plant with fl.-shoots twining above the water: lvs. (often disappeared at flowering-time) linear-lanceolate to lingulate, obtuse, sometimes nearly 1 in. long, narrowed into a slender petiole: bladders numerous on the lvs. and rhizoids, with the mouth near the stalk, nearly or quite globose, almost $\frac{1}{2}$ line in diam.: fls. yellow, 1-6; upper lip of corolla broadly oblong-spatulate; palate erect, crested; spur straight and acute, descending, $\frac{1}{4}$ in. or more long. Trop. Afr. G.C. III. 48:447.—A rapid grower and profuse bloomer in cult. Annual.

AA. *Habit terrestrial or epiphytic: foliage entire, erect.*

B. *Color of fls. white, with a yellow palate.*

3. *montana*, Jacq. Tropical American epiphyte, with clusters of tubers $\frac{1}{8}$ - $\frac{1}{2}$ in. long, minute, deformed, useless bladders and large white fls. with a yellow palate, the fls. 1-4 on a scape, each $1\frac{1}{2}$ in. across: lvs. 4-6 in. long, elliptic-lanceolate. Trunks of trees, W. Indies and S. Amer. B.M. 5923. F.S. 19:1942. I.H. 18:64. G.C. III. 49:405. G. 29:251. G.W. 2, p. 414; 3, p. 518; 15, p. 301.—A lovely species.

BB. *Color of fls. yellow, with an orange palate.*

4. *bifida*, Linn. Terrestrial species from Trop. Asia, with minute bladders and small fls. resembling a diminutive *linaria*: lvs. densely matted, erect, thread-like, 1-2 in. long: fls. yellow, with an orange palate, $\frac{3}{8}$ in. long, 5-8 in a raceme: pedicels drooping in fr.: scape about 6 in. or less high. India, Malaya, China, Japan, Philippines. B.M. 6689.

BBB. Color of fls. purple, violet, or lilac, with a yellow palate.

c. Lvs. broader than long.

d. Shape of lvs. reniform.

5. *jánthina*, Hook. f. Epiphytic Brazilian species growing in the lf.-axils of a bromeliad (*Vriesia*), with kidney-shaped lvs. and beautiful pale blue or lilac fls. $1\frac{1}{2}$ in. across, ornamented by 2 vertical yellow lines on the palate edged with dark violet: lvs. with stalks 4-6 in. long and blades 2-4 in. across: scape about 6-fld.: upper lip hemispheric, arching; lower lip transversely oblong, entire. B.M. 7466.—Intro. by Sander, 1892. "Janthina" is the same as "ianthina," meaning violet-colored.

6. *renifórmis*, St. Hil. Brazilian species found in sphagnum bogs, having kidney-shaped lvs. and rose-colored fls. with 2 darker lines on the palate: upper lip truncate, emarginate; lower lip 3-lobed, the lateral lobes broad, the midlobe much shorter and scarcely produced. Brazil.—Once advertised in this country, but probably lost to cult. Very large for the genus, the lvs. $\frac{1}{2}$ -1 ft. long and scapes $1\frac{1}{2}$ -2 ft. high.

DD. Shape of lvs. obcordate.

7. *Humboldtii*, Schomb. Guiana species, with long-stalked, cordate or obcordate, mostly solitary lvs. and dark purple-blue fls. $2\frac{1}{2}$ in. across, with a triangular lower lip: scapes about 5-fld. F.S. 13:1390.—One of the showiest species. Cult. in England, perhaps not in Amer.

CC. Lvs. long and narrow, linear, oblong or lanceolate.

8. *Endresii*, Reichb. f. Epiphytic Costa Rican species, with tubers about $\frac{1}{4}$ in. long, solitary lvs. and pale lilac fls. $1\frac{3}{4}$ -2 in. across, with a yellow palate: lvs. 1-3 in. long, narrowly elliptic-lanceolate: scape about 5-fld. B.M. 6656. J.H. III. 49:233. G.Z. 24, p. 217. Var. *máior*, Hort., was once offered.—A deciduous species found at altitude of 2,000 feet.

9. *longifolia*, Gardn. Fig. 3888. A Brazilian species, perennial and densely tufted: lvs. lorate or linear-lanceolate, narrowed into a petiole, to 12 in. long: scape slender, reaching 2 ft., with fls. 10 or less. *U. Forgetiána*, Hort., intro. by Sander, is said to be a form of this species and the same as the plant figured in Gn. 52:142 (adapted in Fig. 3888) under the erroneous title of *U. latifolia*. It has beautiful violet-purple fls. nearly 2 in. across, with an orange palate. B.M. 8516. G.C. III. 13:713. The lvs. are singularly variable or plastic. Under favorable conditions, according to Prain, they may grow out into bladder-bearing stolons and may produce from their tips tufts of leaves and stolons and rhizoids. The species thrives under conditions suitable for nepenthes.

WILHELM MILLER.

L. H. B.†

UVÀRIA (Latin, from *uva*, grape, on account of the grape-like clusters of the fruit). *Annonaceæ*. A group very closely allied to the American *Asimina*, but composed of Old World tropical plants, more or less clothed with stellate-pubescent hairs, and with a climbing or scrambling habit.

Flowers either solitary or in few-fld. clusters, either terminal or lf.-opposed; sepals 3, often combined into a cup-shaped calyx; petals 6, in 2 rows, one or both rows imbricate, or overlapping in the bud (not edge-to-edge as in *Desmos*), often connate at the base; stamens numerous, short, cuneate or nearly truncate, with parallel pollen-sacks on the back, very much as in *Asimina*, but with the connective either truncate or terminating in a lf.-like crest: gynæcium formed of a cluster of carpels projecting from the center of the mass of stamens, and developing into a cluster of pedicelled fleshy berries somewhat like those of *Artabotrys* or *Canangium*, but with the seeds usually numerous and

arranged in 2 vertical rows, as in *Asimina*, or sometimes apparently 1-seriate. Few of this genus are in cult. For the principal Philippine species, see E. D. Merrill, in Philippine Journ. of Science, Section Botany, 10:228-30 (1915). The following species is the only one occurring about Manila.

rûfa, Blume (*U. purpurea*, Blanco). SUSONG CALABAO. CARBAO'S TEATS. Fig. 3889. A scandent shrub, often 16-20 ft. in length, the younger parts and lower surfaces of the lvs. rather densely and softly pubescent with radiating starlike clusters of short rusty hairs: lvs. oblong-ovate to oblong-lanceolate, 3-6 in. long, apex acuminate, base rounded or cordate, the petioles very short: fls. extra-axillary or lf.-opposed, solitary or 2 or 3 together in depauperate cymes: frs. a cluster of 18-28 pedicelled oblong velvety berries, red when mature; seeds many, in 2 rows, surrounded by whitish, aromatic, acidulous fleshy pulp.—According to P. J. Wester the fr. of this species together with that

3889. *Uvaria rufa*. a, longitudinal section of fruit; b, cross-section of fruit; c, seeds.

of an allied species having an orange-yellow, velvety skin and yellowish, granular, somewhat sweetish flesh is offered for sale in the markets of Manila. See The Philippine Agricultural Review 6:321, pl. 7, figs. a and b (1913) for further information.

W. E. SAFFORD.

UVULÀRIA (Latin, *uvula*, palate, referring to the hanging flowers). *Liliaceæ*. BELLWORT. "WILD OATS" in some parts. Graceful woodland hardy perennial herbs, useful in the wild border or in heavy shade; not showy, and little planted.

Stem erect and stout, from a creeping or horizontal short rootstock, naked or scaly at base, forking above: lvs. oblong, perfoliate, flat and membranaceous: fls. yellow, drooping, in spring, solitary on terminal peduncles; perianth narrowly campanulate, deciduous, segms. 6, spatulate-lanceolate, acuminate, obtusely gibbous at base, with a deep honey-bearing groove within bordered on each side by a callus-like ridge: caps. truncate, coriaceous, 3-lobed, loculicidal at summit.—About 4 species, N. Amer. Another species sometimes kept in this genus is treated under *Oakesia*.

Uvularias grow 1-1½ feet high, with a number of clustered slender stems which are forked and leaf-bearing mainly above. The foliage is of a delicate green, which with the terminal narrow bell-shaped drooping flowers make the plants elegant though not showy. The species are perfectly hardy and easy of cultivation in any light rich soil and a shady situation. They do well north of a wall in a well-prepared border and in such a position they far exceed the plants of the woods in luxuriance. Strong roots may be slowly forced for spring flowering. For distinction from *Oakesia*, see that genus, to which some of the plants commonly known as uvularias are referred.

A. *Lvs. pubescent beneath.*

grandiflora, Smith. Sts. 1-1½ ft. high, with 1 or 2 lvs. below the fork: lvs. oblong, oval or ovate, somewhat acuminate: fls. pale yellow, 1-1½ in. long; segms. usually smooth on both sides: stamens exceeding the styles: caps. obtusely 3-angled, truncate. May, June. Rich woods, Que. to Minn. south to Ga., Tenn., and Iowa. B.B. 1:409.

AA. *Lvs. not pubescent beneath.*

perfoliata, Linn. Fig. 3890. Sts. more slender than in *U. grandiflora*, with 1-3 lvs. below the fork: lvs. oval-oblong or ovate: fls. pale yellow, about 1 in. long; segms. glandular papillose within; stamens shorter than the styles: caps. obtusely 3-angled, truncate. May, June. Rich woods, U. S.

U. sessilifolia, Linn.=*Oakesia sessilifolia*.

F. W. BARCLAY.

3890. Bellwort.—*Uvularia perfoliata*. ($\times \frac{3}{4}$)

V

VACCINIUM (ancient Latin name of the blueberry).

Ericaceæ. BLUEBERRIES, BILBERRIES, DEEBERRIES, and CRANBERRIES. Erect or creeping shrubs, often with green speckled twigs, well known in this country as the source of excellent wild berries; sometimes planted for ornament.

Leaves alternate, evergreen or deciduous, coriaceous or herbaceous; fls. solitary, axillary or terminal or in racemes; sepals 4-5 or obsolete; corolla gamopetalous, urceolate, cylindrical, campanulate, or rotate, 4-5-toothed or -parted, white or pink; stamens 8-10; anthers dehiscing by pores at the tips of long slender terminal tubes, epigynous; carpels 4-5; ovary inferior, 4-5-celled, or 8-10-celled by intrusion of the midrib of each carpel: fr. a many-seeded berry capped by the persistent calyx.—The genus consists of about 130 species of wide geographic distribution, extending from the Arctic Circle to the higher mountains of the tropics. They are most common in North America and the Himalayas. The genus is almost without representation in the southern hemisphere.

The well-known confusion in the popular names applied to *Vaccinium* is stated by Munson as follows: "The terms 'bilberry' and 'whortleberry' usually mentioned as 'common names' by American writers are seldom or never heard among the common people in this country; while 'huckleberry' is often used indiscriminately for plants of this genus and for the *Gaylussacias*. In the central states the term 'huckleberry' is usually applied to *V. corymbosum*, while 'blueberry' is given to the low-growing species, like *V. canadensis* and *V. pennsylvanicum*. In New England, 'huckleberry' is reserved for species of *Gaylussacia*, while 'blueberry' is applied to the lower-growing species as above, and 'high-bush blueberry' to *V. corymbosum*. The red-berried species are, in general, referred to as 'cranberries.'"

Among the plants that lend tone to the landscape in October and November by reason of their bright foliage, many of the species of *Vaccinium* may be included—the brilliant red, crimson, and orange colors often persisting much longer than the bright-hued leaves of a large number of other plants. Of the ornamental species none is more strikingly beautiful late in the autumn than the common high-bush blueberry, *V. corymbosum*. When well grown it is a stout, thick, spreading bush 8 to 10 feet high. The plant is beautiful when in flower; the fruit is attractive and of the best quality, and the bright scarlet and crimson effects in

late autumn, rivaling the sumach in brilliancy, are unsurpassed. As an ornamental plant the species deserves a place in every garden. *V. pennsylvanicum* also brightens waste places for a short time, but drops its foliage too early to be worthy of planting as an undershrub. The same is true of *V. canadense*, which is in many respects similar. *V. stamineum*, though early deciduous, is attractive when in bloom and throughout the summer by reason of its graceful habit. It is particularly adapted for sterile sandy or gravelly

situations, and it is one of the very few ornamental shrubs specially suited for densely shaded situations. It has the peculiarity of never forming a true flower-bud, the blossom being open from the first. *V. arboreum* forms an irregular shrub too diffuse and straggling to be of value except when planted in masses at the South. *V. hirsutum* is as beautiful in its autumn coloring as is *V. corymbosum* and, like that species, retains its foliage late in the season. *V. Vitis-Idæa* and *V. uliginosum*, with their shining box-like foliage, can be used very effectively as edging for the shrubbery border. (W. M. Munson.)

For the most part, *vacciniums* are plants of peaty or sandy acid soil, and will not thrive in soils of a richer nature. Many species are very sensitive to the presence of lime, and they require special attention as to soil. See *Blueberry*.

3891. *Vaccinium stamineum*. (X1)

Quoted statements in the specific descriptions in the following treatment are from the original article on this genus by the late W. M. Munson in the "Cyclopedia of American Horticulture;" that article also gives an interesting account of the native production of the fruit.

KEY TO THE SECTIONS (No. 25 doubtful).

- A. Corolla campanulate to urceolate or cylindrical.
- B. The corolla 5-lobed, open-campanulate; anthers awned on the back. Section I. BATODENDRON
- BB. The corolla 4-5-toothed, urceolate, cylindrical, or campanulate-oblong.

- c. Filaments hairy; anthers awned on the back: ovary 10-celled. Section II. CYANOCOCCUS
cc. Filaments glabrous: ovary 4-5-celled.

- D. Anthers 2-awned on the back: lvs. deciduous. Section III. EUVACCINIUM
DD. Anthers awnless on the back: lvs. coriaceous, evergreen. Section IV. VITIS-IDÆA

- AA. Corolla rotate or nearly so, 4-parted or divided, the narrow divisions revolute. Section V. OXYOCOCCUS

Section I. BATODENDRON. Corolla open-campanulate, 5-lobed; anthers tipped with long slender tubes, and 2-awned on the back: ovary and berry spuriously 10-celled, ripening in autumn, scarcely edible: lvs. deciduous, but of rather firm texture: fls. axillary and solitary or in leafy-bracted racemes, slender-pedicelled: bractlets minute or none.

- A. Fls. articulated with the pedicel; anthers included: berries black, many-seeded. 1. arboreum
AA. Fls. not so articulated; anthers much exserted: berry greenish, few-seeded.
B. Berries greenish or yellowish. 2. stamineum
BB. Berries longer, plum-purple. 3. melano-
[carpum]

1. arboreum, Marsh. FARKLEBERRY. SPARKLEBERRY. Spreading shrub or small tree, 6-25 ft. high, with glabrous or somewhat pubescent branchlets: lvs. 1-2 in. long, evergreen in the S., somewhat coriaceous, smooth and shining above, paler and sometimes

3892. The high-bush blueberry.—*Vaccinium corymbosum*.
(Spray $\times \frac{1}{2}$)

pubescent beneath, obovate to oval, acute or obtuse, entire or obscurely denticulate: fls. profuse, axillary, and leafy-racemose, pendulous, articulated with the slender pedicel; corolla open-campanulate, 5-lobed, white; stamens included: berry small, globose, black, rather astringent, inedible. Sandy soil along river banks, Fla. and Texas to N. C. and Ill. L.B.C. 19:1885. B.M. 1607 (as *V. diffusum*). B.B. 2:580.—“It forms an irregular shrub too diffuse and straggling to be of use except in masses, for which purpose it is useful at the South.”

2. stamineum, Linn. DEERBERRY. SQUAW HUCKLEBERRY. Fig. 3891. A divergently branched shrub, 2-5 ft. high, with pubescent twigs, not white-speckled: lvs. 1-4 in. long, oval to obovate-oblong or elliptical, acute, entire, pale, glaucous and pubescent beneath: fls. very numerous in large leafy-bracted racemes, showy, jointed with the slender spreading or pendulous pedicels; calyx glabrous; corolla pure white, rarely purple-tinged, open-campanulate, 5-cleft, anthers and style exserted: fr. large, $\frac{3}{8}$ - $\frac{1}{2}$ in. long, globose or pyriform, greenish or yellowish, glaucous, few-seeded, almost or quite inedible. Dry woods and thickets, E.

N. Amer. R.H. 1907, p. 94.—Corolla peculiar in not being closed in the bud.

3. melanocarpum, Mohr. SOUTHERN GOOSEBERRY. Similar to the last but more white-pubescent: calyx white-tomentose: berries twice as large, shining black, with a juicy purple pulp, sweetish and slightly tart. Southern states.

Section II. CYANOCOCCUS. Corolla from cylindraceous to campanulate-oblong or ovoid, 5-toothed; filaments hairy; anthers included, awnless: ovary and berry completely or incompletely 10-celled by a spurious partition or projection from the back of each carpel; berry blue or black with a bloom, juicy, sweet, and edible, many-seeded: fls. white or rose-color, in fascicles or very short racemes, developed with or a little before the lvs. from large and separate scaly buds, short-pedicelled: scaly bractlets as well as bracts mostly caducous or deciduous.

- A. Lvs. thick, evergreen: bracts reddish, firm, tardily deciduous.
B. Sepals obtuse: teeth of lvs. glandular: berries black. 4. nitidum
BB. Sepals acute: teeth of lvs. bristly: berries blue. 5. Myrsinites
AA. Lvs. thinner, deciduous: bracts scaly, deciduous.
B. Corolla cylindrical, mostly over twice as long as broad.
C. The lvs. hairy beneath, serrulate. . . 6. virgatum
CC. The lvs. glabrous beneath, entire or nearly so. 7. corymbosum
BB. Corolla urceolate or short-cylindrical, mostly less than twice as long as broad.
C. Ovary and berry glabrous.
D. Lvs. very pubescent at least beneath.
E. Plant tall. 8. atrococcum
EE. Plant low. 9. canadense
DD. Lvs. glabrous or nearly so except sometimes the midrib.
E. The lvs. elliptic, acute, green both sides, serrulate. . . . 10. pennsylvani-
EE. The lvs. broader, less acute, dull above, glaucous beneath, nearly entire. . . . 11. vacillans
CC. Ovary and berry glandular-hirsute. 12. hirsutum

4. nitidum, Andr. A diffusely much-branched shrub, $\frac{1}{2}$ -2 ft. high, with smooth or rarely pubescent branchlets: lvs. thick, coriaceous, shining, $\frac{1}{4}$ - $\frac{3}{4}$ in. long, elliptic-oblong or obovate, acute or apiculate, serrulate, often with glandular teeth, nearly sessile, glabrous: racemes umbel-like: sepals and bracts rounded, obtuse; corolla small, $\frac{1}{8}$ - $\frac{1}{4}$ in. long, short-campanulate-cylindrical, 5-toothed, rose-color or whitish: berry small, black. Dry pine lands, Ga. to Fla.—Closely related to the next.

5. Myrsinites, Lam. Low evergreen nearly or quite glabrous shrub, erect or decumbent: lvs. firm, variable, spatulate to oblong-obovate, $\frac{1}{4}$ -1 in. long, entire or serrulate, sometimes denticulate, mostly shining above, glabrate or puberulent beneath, strongly veiny: bracts and calyx-teeth acute or acutish; corolla cylindrical, $\frac{1}{4}$ - $\frac{3}{4}$ in. long: berries blue, globose. Sandy pine barrens, Va. to Fla. and La. B.M. 1550 (as *V. nitidum* var. *decumbens*).—The chief points of difference between this and the last species are the puberulent branchlets, prominently veined, bristly ciliate lvs., and acute calyx-teeth and bracts. “Grown as a pot-plant in coolhouses in England under the name of *V. Sprengerii*.”

6. virgatum, Ait. A shrub 2-12 ft. high, with slender green branchlets, the young twigs puberulent: lvs. ovate-oblong to cuneate-lanceolate, $\frac{3}{4}$ -2 in. long, thin-nish, acute, often mucronate, entire or minutely serrulate, green and glabrous above, pale or glaucous beneath; veins pubescent: fls. in short racemes, on naked twigs, appearing before the lvs.; corolla long and

nearly cylindrical, $\frac{1}{4}$ – $\frac{3}{8}$ in. long, white or pink; bracts small, deciduous; berry black, almost or quite destitute of bloom. Swamps, S. Va. to Fla. and La. B.M. 3522. B.R. 302 (as *V. fuscatum*).—The distinction between this species and *V. corymbosum* is very slight. It is probable that, possibly excepting var. *tenellum*, this is only a southern form of *V. corymbosum* and should be reduced to varietal rank.

Var. *tenellum*, Gray (*V. tenellum*, Ait.). A low form, mostly less than 2 ft. high, with smaller lvs. and nearly white fls. in short close clusters. S. Va. to Ark., Fla., and Ala.

7. *corymbosum*, Linn. HIGH-BUSH BLUEBERRY. SWAMP BLUEBERRY. Fig. 3892. A tall handsome bushy shrub, 4–12 ft. high, with yellowish green warty branchlets: lvs. large, $1\frac{1}{2}$ –3 in. long, ovate-oblong to elliptical, acutish, glabrous, half grown at flowering time: corolla long-cylindrical, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, white; berries blue-black, of excellent flavor. Moist woods or bogs, N. E. N. Amer. Em. 2:454. Amer.

Agric. 1886:364.—Exceedingly variable, and many forms unite the several varieties. Apparently many natural hybrids occur between this and other species, rendering the taxonomy very difficult. *V. corymbosum* is one of the most valuable species both for fr. and as an ornamental shrub. It thrives in peaty acid soil.

Var. *amœnum*, Gray (*V. amœnum*, Ait.?). A form with lvs. bristly ciliate or serrulate, bright green on both sides, shining above. "Mainly in the Middle Atlantic states." B.R. 400. B.M. 3433 (as *V. corymbosum*). Probably of hybrid origin.

Var. *pallidum*, Gray (*V. pallidum*, Ait. *V. albiflorum*, Hook. *V. Constiblaei*, Gray). A pale and glaucous or glaucous form with or without some pubescence: plant generally low, 2–4 ft. high: lvs. ciliate-serrulate. Common in mountainous regions southward. B.M. 3428.—Probably a distinct species.

Var. *fuscatum*, Gray (*V. fuscatum*, Ait.). A tall form with the mature entire lvs. fuscous-pubescent beneath: fls. virgate, somewhat spicate on the naked flowering twigs. In and about swamps, Ga. and Fla. to La. and Ark.

8. *atroccum*, Heller (*V. corymbosum* var. *atroccum*, Gray). DOWNY SWAMP BLUEBERRY. A tall branching shrub similar to the last species: lvs. elliptic-oblong, acute, entire, dark green above, densely pubescent beneath, unexpanded at flowering-time: fls. in dense racemes; corolla shorter, greener, and often redder than in the last: berries said to be always black without bloom, smaller than in the last, of good flavor. Moist woods and bogs of E. N. Amer.—Apparently distinct from *V. corymbosum*, but seeming to hybridize with it.

9. *canadense*, Kalm. CANADA BLUEBERRY. Low erect shrubs, 1–2 ft. high, much branched: the branchlets very downy: lvs. entire, dark green, $\frac{3}{4}$ – $1\frac{1}{2}$ in. long, oblong-lanceolate or elliptical, acute, downy on both sides: corolla short-cylindrical, greenish white, often tinged with red: berries medium or small, late, blue

with much bloom. Low woods and bogs, New England, mountains of Pa., northward and northwestward. B.M. 3446.—"This species, commonly known as "velvet-leaf" or "sour-top" because of the character of its foliage and the somewhat acid fr., usually grows in rather boggy localities. The fr. is more acid than the other low forms and matures from 1–3 weeks later. It is not so popular in the market as the sweeter kinds, but it is very prolific and its lateness in ripening is in its favor."

10. *pennsylvanicum*, Lam. LOW BLUEBERRY. Fig. 3893. A dwarf shrub, 6–15 in. high: branchlets glabrous or hairy northward: lvs. membranous, oblong-lanceolate or elliptical, acute, distinctly serrulate with bristly pointed teeth, shining and green on both sides but often hairy on the midrib beneath: fls. on short pedicels; corolla short-cylindrical, greenish white; berries large, bluish black with a bloom, sweet, the earliest to ripen in the North. E. N. Amer. B.M. 3434. Em. 2:456. Rep. Me. Exp. Sta. 1898:171. Var. *angustifolium*, Gray. A dwarf form with more decidedly lanceolate lvs. Newfoundland, mountains of New England and northward. Var. *nigrum*, Wood (*V. nigrum*, Brit.). Foliage very glaucous: berries black, without bloom. Usually found in colonies in the same situations as the typical form and occasionally the two are found intermingled. Rep. Me. Exp. Sta. 1898:171. The fls. are said to appear earlier than those of *V. pennsylvanicum*.—"This species is extremely variable in size and shape of fr. and fls., but, with the exception of the varieties noted, the variations do not appear sufficiently constant to warrant making separations. In general the plant is of low, semi-prostrate habit, is extremely prolific, and thrives well on dry sandy hills. It furnishes the bulk of the blueberries found in the eastern markets. When mown down or

3894. *Vaccinium hirsutum*. ($\times \frac{3}{4}$)

burned, the new erect shoots produce, the following year, a long spike-like mass of bloom and fruit, which may be stripped off by the handfuls. Because of its character and early ripening habit, it is known on the blueberry plains as 'Early Sweet' or 'Low Sweet.'

11. *vacillans*, Kalm. LOW BLUEBERRY. Erect, glabrous, widely branched, $\frac{1}{2}$ –3 ft. high: lvs. 1–2 in. long, obovate or oval, scarcely acute, entire or sparingly serrulate, pale or dull glaucous on both sides: fls. in

rather dense clusters generally on the leafless summits of twigs; calyx reddish; corolla short-cylindrical, greenish white, often tinged with red: berries large, with much bloom, of excellent flavor, ripening late with *V. canadense*. Dry sandy or rocky places, N. E. N. Amer. Em. 1:454.—“One of the most common species of the northern and central states, particularly west of the Alleghanies. One of the two commonest upland dwarf blueberries.”

12. *hirsutum*, Buckl. HAIRY BLUEBERRY. BEAR BLUEBERRY. Fig. 3894. Low shrub, 1–2 ft. high: sts. green, grooved, obscurely 4-angled: branchlets hirsute with spreading white hairs: lvs. oblong-elliptic to ovate, acute or cuspidate, $\frac{3}{4}$ – $1\frac{1}{4}$ in. long, entire, deep green above, paler beneath, pubescent or hirsute on both faces, very short-petioled: racemes few-fl.: ovary, calyx, and corolla densely hirsute; sepals acute; corolla large, ovoid, campanulate, pale or reddish: berries purplish black, glandular-hirsute. Shaded mountain slopes, N. C. to Tenn. and Ga. G.F. 2:365 (adapted in Fig. 3894).—“This species, discovered about 1840, was lost sight of for half a century until rediscovered by Sargent, and transferred to the Arnold Arboretum. It is readily distinguished by the hairy fls. and fr. The fr. is described as fully as large as that of *Gaylussacia baccata*, shining black, and of an agreeable flavor. Under cult., it is not so densely hairy as in the wild state. It gives promise of being valuable under cult. as one of the latest of its kind to ripen. At the Arnold Arboretum the period of greatest fruitage is in the middle of Aug., berries remaining into Sept.”

Section III. EUVACCINIUM. Corolla from ovate to globular and more or less urceolate, 4–5-toothed, rose-color or nearly white; filaments glabrous; anthers 2-awned on the back, included: ovary and berry 4–5-celled, with no false partitions: lvs. deciduous: fls. on drooping pedicels, solitary or 2–4 together, developing with or soon after the lvs.

- A. Fls. 2–4 in a fascicle, from separate scaly buds, 4-merous.....13. *uliginosum*
- AA. Fls. solitary, axillary, usually 6-merous.
- B. Branchlets not angled.....14. *cespitosum*
- BB. Branchlets angled.
- C. Shrubs low ($1\frac{1}{2}$ ft. or less).....15. *Myrtillus*
- CC. Shrubs tall (3–6 ft.).
- D. Lvs. serrate: berries blackish, without bloom.....16. *membranaceum*
- DD. Lvs. entire or nearly so.
- E. Berry blue with bloom: lvs. 1–2 in. long.....17. *ovalifolium*
- EE. Berry red: lvs. $\frac{1}{4}$ – $\frac{3}{4}$ in. long. 18. *parvifolium*

13. *uliginosum*, Linn. BOG BILBERRY. A low spreading much-branched shrub, $\frac{1}{4}$ – $1\frac{1}{2}$ ft. high: lvs. thickish, obovate or oval, obtuse or retuse, $\frac{1}{2}$ –1 in. long, entire, nearly sessile, pale and glaucous on both sides, slightly pubescent beneath: fls. 2–4 together or sometimes solitary; calyx 4-parted, rarely 5-parted; corolla urn-shaped, 2–5-lobed, pink: berries bluish black with a bloom. Arctic and alpine N. Amer., Eu., and Asia. B.B. 2:576.—“The plant is useful for the shrubby border in cold wet acid situations and its fr., though of poor quality, is used for food by the natives of the Northwest.”

14. *cespitosum*, Michx. DWARF BILBERRY. A dwarf tufted shrub, 3–12 in. high, nearly glabrous throughout: branches rounded: lvs. $\frac{1}{4}$ – $1\frac{1}{2}$ in. long, obovate, cuneate-lanceolate or cuneate-spatulate, narrowed at base, obtuse or acutish, serrulate, smooth and shining: fls. solitary, on short axillary peduncles, nodding; corolla urceolate, small, slightly 5 (rarely 4)-toothed, pink or red: berries large, blue with bloom, sweet. Gravelly or rocky woods and shores, Maine, Vt., Wis., Cal., and northward; also on alpine summits of New England and N. Y. B.M. 3429.—May be used in rock-gardens.

15. *Myrtillus*, Linn. WHORTLEBERRY. BILBERRY. Low glabrous shrub with sharply angled branches: lvs. $\frac{1}{2}$ – $\frac{2}{3}$ in. long, ovate or oval, serrate, conspicuously reticulate-veined, glabrous, thin and shining: corolla globular ovate; calyx-limb almost entire: berries black, nodding. Mountainous regions, Eu., Asia, possibly N. Amer.—“Generally used as an article of diet and in making of drinks, particularly in the Old World. It is from this species that the common name whortleberry is derived. It is not of much economic importance in Amer.” The red-fruited form of the Rocky Mts., and the N. W. has been separated as *V. scoparium*, Leiberg, and is so recognized by Piper and by Coulter & Nelson. Its occurrence in the trade is doubtful.

16. *membranaceum*, Douglas (*V. myrtilloides*, Hook., not Michx.). An erect branching shrub, mostly glabrous throughout: the twigs slightly angled: lvs. 1–2 in. long, oval, oblong or ovate, acute or obtuse, finely serrate, membranous, reticulate-veined, green above, paler beneath, not shining: calyx-limb entire; corolla depressed-globose, yellowish green or purplish: berries large, oblate, black or purplish black, rather acid. Lake Superior, N. Wyo., westward and northwestward.

3895. Mountain cranberry.—*Vaccinium vitis-idaea*.
($\times$ about $\frac{1}{4}$)

17. *ovalifolium*, Smith. A slender straggling shrub, 3–12 ft. high, with slender, more or less angled branches: lvs. 1–2 in. long, oval to oblong, glabrous, thin, mostly rounded at both ends, entire or nearly so, pale green above, glaucous beneath: fls. solitary, on short recurved pedicels; calyx minutely 10-toothed; corolla ovoid or globose, urceolate: berries $\frac{1}{2}$ in. diam., large, bluish purple with bloom, acid but very good. Moist woods, Que. to Ore. and Alaska.—“This species is very abundant in the N. W., forming a large part of the undergrowth along the southern coast of Alaska. The berries, rather larger than peas, are collected in great quantities by the Indians, who use them fresh and dry them for winter. The exceptionally large berries and vigorous habit of this species suggest its value for cult., and particularly for crossing with the low-growing species.”

18. *parvifolium*, Smith. Shrub, 6–12 ft. high, straggling, with slender green sharply angled branches: lvs. $\frac{1}{4}$ – $\frac{3}{4}$ in. long, oblong or oval, obtuse, entire, dull or pale: pedicels short, nodding in fr.: sepals 5; corolla globular, nearly white: berries bright red, acid, but fine for table use. N. Calif. to Alaska.—Not common in cult.

Section IV. *VITIS-IDÆA*. Corolla from ovate to globular and more or less urceolate, 4-5-toothed, rose-color or nearly white; filaments hairy; anthers awnless on the back: ovary and berry 4-5-celled, with no false partitions: lvs. coriaceous and persistent: fls. in short racemes or clusters from separate buds, bracteate and 2-bracteolate.

A. Corolla 5-lobed; stamens 10.

B. Branchlets pubescent: plant erect. 19. *ovatum*

BB. Branchlets glabrous: plant procumbent. 20. *crassifolium*

AA. Corolla 4-toothed; stamens 8. 21. *Vitis-IDæa*

19. *ovatum*, Pursh. An erect, rigid, evergreen shrub, 2-8 ft. high, with pubescent branchlets: lvs. $\frac{1}{2}$ -1 in. long, thick and firm, very numerous, shining, ovate to oblong-lanceolate, acute, minutely and acutely serrulate, glabrous or nearly so, bright green both sides: fls. in short and close axillary clusters; deciduous bracts usually red; corolla campanulate, $\frac{1}{4}$ in. long, rose-color or nearly white; calyx-lobes acute, red: berries black, acid, with or without bloom. Moist woods, Vancouver to Monterey, Calif. B.R. 1354. J.F. 4:424.—“A distinctly western species, and one of California’s most beautiful hedge-plants, but not well known. It is very tenacious of life and bears pruning well. It is prop. from suckers, cuttings, and seeds, which last it bears freely.”

20. *crassifolium*, Andr. Slender trailing shrub: sts. 2-3 ft. long; twigs pubescent: lvs. small, $\frac{1}{4}$ - $\frac{1}{2}$ in. long, leathery and shining, oval to narrowly oblong or ovate or obovate, obtuse, sparsely serrulate or entire: fls. few, almost sessile, in small axillary clusters; corolla globose-campanulate, small ($\frac{1}{8}$ in. long), rose-red, rarely whitish: berries black. Sandy moist pine lands, N. C. to Ga. B.M. 1152.—“Useful for the shrubby border South.”

21. *Vitis-IDæa*, Linn. (*Vitis-IDæa Vitis-IDæa*, Brit.). MOUNTAIN CRANBERRY. COWBERRY. PARTRIDGE BERRY in the N. FOXBERRY. Fig. 3895. Plants low, 6-10 in. long, creeping, glabrous: lvs. coriaceous, evergreen, obovate or oval, $\frac{1}{4}$ - $\frac{3}{4}$ in. long, obtuse, dark green and shining above, with blackish bristly points beneath: fls. in short subterminal racemes; corolla bell-shaped, white or rose-colored, 4-cleft: berries dark red, acid. Arctic region, to the coast and mountains of New England, Minn., and Brit. Col. L.B.C. 7:616 (as var. *major*); 11:1023 (as var. *minor*).—“The frs., which are rather larger than currants, acid and somewhat bitter when uncooked, are largely used in the more northern regions for tarts, jellies, and preserves, or as a substitute for the common cranberry. According to Macoun, the fishermen’s families along the Gaspé coast and the north shore of the Gulf of St. Lawrence gather the fr. of this species in large quantities for their own use and for sale, calling it ‘low-bush cranberry.’ Throughout the whole of N. Canada, hunters and trappers, as well as the native Indians, have frequently to depend upon it for food. It is valuable for the shrubby border, where the strong contrast of the dark green foliage and the bright colored persistent fr. is very striking.”

Section V. *OXYCOCCUS*. Corolla deeply 4-cleft or 4-parted; the lobes linear or lanceolate-oblong and reflexed; anthers exerted, awnless on the back, with very long terminal tubes: ovary and berry 4-celled, destitute of false partitions: fls. axillary and terminal, nodding, on long filiform pedicels, appearing in early summer: fr. maturing in autumn.

A. Shrubs erect: lvs. deciduous, $1\frac{1}{2}$ -2 in. long. 22. *erythro-*

AA. Shrubs trailing: lvs. very small, evergreen. [carpum]

B. Lvs. ovate, acute. 23. *Oxycoccus*

BB. Lvs. oblong, obtuse. 24. *macrocarpon*

22. *erythrocarpum*, Michx. (*Oxycoccus erythrocarpus*, Pers.). An erect, divergently branching shrub, 1-4 ft. high: lvs. $1\frac{1}{2}$ -3 in. long, oblong-lanceolate to ovate, acuminate, finely bristly serrulate, thin, green both sides, paler beneath: pedicels solitary, axillary, shorter than the lvs., recurved, bractless: corolla flesh-color, $\frac{1}{2}$ in. long, 4-cleft, the lobes narrow, acute, revolute: berries globose, $\frac{1}{4}$ in. diam., bright red turning darker, acid, scarcely edible. Higher Alleghanies, Va. to Ga. B.M. 7413.

23. *Oxycoccus*, Linn. (*Oxycoccus Oxycoccus*, McM.). SMALL CRANBERRY. CRANBERRY of the Old World. Slender creeping plants with short filiform sts., 4-10 in. long: lvs. ovate, acute, $\frac{1}{4}$ in. long, with strongly revolute margins, coriaceous, evergreen, dark green and glossy above, white-glaucous beneath, glabrous: pedicels 1-4, terminal: filaments one-half length of anthers: berry red, $\frac{1}{4}$ - $\frac{1}{2}$ in. diam. Sphagnum swamps in subarctic and alpine regions of Old and New Worlds.—“Though smaller, its fr. is by many considered superior to that of the next.”

24. *macrocarpon*, Ait. (*Oxycoccus macrocarpus*, Pers.). LARGER AMERICAN CRANBERRY. Sts. slender, creeping, elongated, 1-4 ft. long, somewhat coarser and stouter than in the last, the fl.-branches ascending: lvs. oblong or oval, obtuse or retuse, $\frac{1}{3}$ - $\frac{1}{2}$ in. long, in texture and coloration similar to the last, margin less revolute: pedicels several, axillary and lateral: fls. larger; filaments shorter than in the last: berry red, larger, $\frac{1}{3}$ -1 in. long. N. N. Amer. B.M. 2586. Em. 2:456. See *Cranberry*.

Section VI (Position of this species doubtful)

Anthers muticous: branches red. 25. *erythrinum*

25. *erythrinum*, Hook. An erect, glabrous, evergreen shrub, with bright red twigs: lvs. ovate, obtuse, coriaceous, entire: fls. in long, 1-sided, terminal racemes; corolla cylindraceous, 5-toothed, $\frac{1}{2}$ in. long, purple-red; anthers without terminal tubes. Mountains of Java. B.M. 4688. J.H. III. 34:39; III. 51:593. J.F. 4:364.—“Sent to England in 1852, and since grown by various nurserymen as a greenhouse plant. It is a strong plant, furnishing an abundance of bloom in Dec. and Jan. Not remarkable, but worthy of a place in collections. A very distinct type.” The position of this species is doubtful. The absence of anther-tubes suggests that it may not belong to the genus *Vaccinium*.

K. M. WIEGAND.

VAGARIA (derivation obscure). *Amaryllidacæ*. Large tunicate bulbous herb, useful for autumn-flowering: lvs. strap-shaped, appearing rather late: fls. in many umbels, short-pedicelled, white; perianth narrowly funnel-shaped, tube slender, lobes narrow, erect-spreading; stamens affixed to the throat, slightly shorter than the perianth; ovary ovoid-globose, 3-celled: caps. membranaceous, somewhat valvately dehiscent.—One species, Syria.

parviflora, Herb. Bulb globose, about $1\frac{1}{2}$ in. through: fls. white. Offered by European bulb-growers for outdoor planting.

F. TRACY HUBBARD.

VALERIAN: *Valeriana*. Greek V.: *Polemonium*. Red V.: *Centranthus*.

VALERIÀNA (Latin *valeo*, to be strong, in allusion to medicinal uses). *Valerianacæ*. VALERIAN. Glabrous or rarely pubescent or villous perennial herbs, subshrubs, or shrubs, which are erect or scandent, most of them hardy and showy garden plants.

Roots strong-smelling: lvs., especially the radical ones, entire or dentate, or the cauline or all pinnatifid or once-, twice-, or thrice-pinnatisect: cymes sometimes dense, few-fl. and terminal, or clustered in dense or interrupted spikes, sometimes laxly corymbosely or variously paniced: fls. small, white or rose; calyx-limb

before anthesis not conspicuous, after flowering divided into 5-15 plumose-ciliate setae; corolla-tube attenuate at base, limb 5-cleft; stamens 3, rarely by abortion 1 or 2; fr. a compressed achene with the rear face 1-nerved, the front face 3-nerved.—About 265 species, mostly in the temperate and colder regions of the northern hemisphere but a few in the tropics and in the extra-tropical regions of the southern hemisphere.

The valerians in the American trade are hardy perennials of easiest culture. Only *V. officinalis* is well known. This is one of the characteristic plants of old gardens, being prized for the spicy fragrance of its numerous flowers in spring. It spreads rapidly from suckers arising from the roots, soon forming large colonies. The common species are often grown from seeds. *V. alba* and *V. rubra* of the trade are no doubt *Centranthus ruber*.

A. Rootstock perpendicular, branching below.

1. *edulis*, Nutt. Perennial, 2-4 ft. high, glabrous or nearly so; rootstock perpendicular, fusiform, branching below: lvs. thickish, not serrate, slightly pubescent; radical oblanceolate to spatulate, entire or some sparingly lacinate-pinnatifid, tapering into a margined petiole; cauline rarely none, commonly 1-3 pairs, sessile and pinnately parted into 3-7 linear or lanceolate

divisions, the terminal one spatulate: fls. polygamous-dioecious, yellowish white, in an elongated panicle. Ohio to Ariz. and Brit. Col. in wet or moist lands.—The roots are eaten by Indians.

2. *alliariifolia*, Vahl. Perennial, glabrous, erect: rhizome thick and branched: st. tall, sulcate: radical and lower lvs. long-petioled, broadly cordate, coarsely toothed or repand; upper smaller, sessile or subsessile, cordate-triangular: corymb terminal, compound: fls. clustered, pink: fr. glabrous. E. Eu. and W. Asia.

AA. Rootstock turnip-shaped.

3. *ceratophylla*, HBK. Perennial, glabrous, sparingly leafy, up to about 16 in. high: rootstock turnip-shaped: st. herbaceous, terete, striate: lvs. pinnatisect; segms. trifid-hastate, sessile; divisions linear, acuminate: corymb terminal, dichotomous: fls. snow-white: fr. pubescent. Mex.

3896. Garden heliotrope.—*Valeriana officinalis*. ($\times \frac{1}{4}$)

AAA. Rootstock horizontal or ascending, with small fibrous roots.

B. St.-lvs. not compound or lobed, but sometimes dentate.

4. *montana*, Linn. Perennial, glabrous or nearly so, about 1 ft. high: rhizome slender, many-branched: lvs. entire or dentate; those of the sterile young shoots and the lowest ovate-rotundate or ovate, subcordate, rather long-petioled; cauline lvs. triangular-oblong, acute or acuminate; uppermost linear-lanceolate: corymb terminal, compound or simple: fls. bright rose, dioecious. Eu. and Caucasus. L.B.C. 4:317.

BB. St.-lvs. (at least the lower ones) pinnate or pinnately lobed.

c. Fls. dioecious or polygamous.

5. *alpestris*, Stev. (*V. alpina*, Adams). Perennial, glabrous, about 6 in. high: rhizome horizontal, short, slightly branched: radical and lower lvs. ovate-oblong, repand-dentate; intermediate lvs. acuminate, subsessile, unequally 2-3-parted or often undivided; uppermost linear, small: corymb terminal, clustered and head-like: fls. pink; ovary glabrous. Caucasus region.

6. *dioica*, Linn. MARSH VALERIAN. Perennial, rather glabrous, about 1-2 ft. high: rhizome slender, stoloniferous, long-creeping: lower lvs. and those of the sterile shoots ovate-subcordate, elliptic or spatulate, entire, rather long-petioled; cauline lower lyrate-pinnate-parted; upper pinnatisect with linear segms. in 3-5 pairs: corymb terminal: fls. dioecious, pale rose-color, the sterile fls. larger. Moist soil. Eu.

CC. Fls. hermaphrodite.

D. Radical lvs. (at least some of them) pinnatisect or pinnate.

7. *officinalis*, Linn. COMMON VALERIAN. GARDEN HELIOTROPE. CAT'S VALERIAN. ST. GEORGE'S HERB. Fig. 3896. Perennial, glabrous or more or less pubescent below, 2-5 ft. high: rhizome truncate, sometimes stoloniferous: sts. erect, simple below, somewhat branching above, sulcate: lvs. all pinnatisect; segms. 7-10-paired, usually dentate-serrate, those of the lower lvs. ovate-oblong, of the upper lvs. lanceolate, acuminate: corymb broadly paniculate, long-branched: fls. numerous, whitish, pinkish or lavender, very fragrant. Eu., N. Asia. G.W. 12, p. 472.—Variable. The medicinal valerian is obtained mostly from the roots of this species. Var. *alba*, Hort., is a white-fl. form. Var. *rubra*, Hort., is a red-fl. form.

8. *excelsa*, Poir. (*V. sambucifolia*, Mikan). Perennial, with long runners ending in rosettes: st. channelled, glabrous: lvs. pinnate; lfts. 3-5 pairs, coarse serrate or serrate-dentate, rarely entire, terminal lft. largest: infl. rather crowded: fls. reddish or white, rather larger than *V. officinalis*. Eu. Gn. 67, p. 3.

9. *sitchensis*, Bong. Perennial, 1 ft. or less high: rootstock ascending, thick: radical lvs. ovate or oblong, simple or somewhat lobed; cauline lvs. short-petioled, 3-5-foliate, divisions or lfts. orbicular to oblong-ovate or in the upper ones ovate-lanceolate: fls. white, very fragrant, in contracted cymes; corolla funnelform, about $\frac{3}{8}$ in. long. Rocky Mts. to Alaska. G.F. 9:515.—A very early bloomer.

DD. Radical lvs. entire or merely dentate.

10. *arizonica*, Gray. Perennial, glabrous, 6 in. high: rhizome creeping, rather thick: sts. erect: lvs. succulent, basal ovate, entire or nearly so, 1 in. long, intermediate few, long-petioled, 2-4-lobed; cauline subsessile, 3-5-parted: cyme glomerate-congested: fls. whitish or pinkish; corolla $\frac{1}{2}$ in. long, tubular broadened gradually. Ariz. G.C. III. 29:198. G.W. 12, p. 102.

11. *Phu*, Linn. Perennial, glabrous or pilose, not so tall as *V. officinalis*: rhizome inclined, simple, fusiform: st. stout, tall, simple or slightly and shortly branched: radical lvs. ovate-oblong, long-petioled, entire or at base

incised-lobed; cauline pinnately parted into 3-4 pairs of oblong, acute, entire, decurrent segms.: corymb trichotomous: fls. whitish to somewhat flesh-colored. Caucasus region. Var. *aurea*, Hort., has young shoots golden yellow.

12. *pyrenæica*, Linn. Perennial, 2-4 ft. high, pubescent: rhizome large; stolons none: st. erect, sulcate: lvs. glabrous, radical large, long-petioled, cordate, coarsely and unequally toothed; cauline auriculate,

3897. *Valerianella olitoria*.—Corn salad.

3-cut, segms. dentate, terminal larger and ovate-cordate, lateral 2 (rarely 4 or 0) obliquely elliptic: cyme large, corymbose: fls. pale rose: fr. glabrous, linear-oblong. Pyrenees.

V. alba, Mazz., is *Centranthus ruber* var. *albus*.—*V. coactnea*, Hort., is offered (*Centranthus*?).—*V. coactnea alba*, Hort., is offered in the trade.—*V. Cornucopiae*, Linn., is *Fedia Cornucopiae*.—*V. macrosiphon*, Vilm., is *Centranthus macrosiphon*.—*V. rosea*, Hort., is offered in the trade.—*V. rubra*, Linn., is *Centranthus ruber*.

F. TRACY HUBBARD.†

VALERIANÉLLA (diminutive of *Valeriana*). *Valerianaceæ*. Annual dichotomously branched herbs, chiefly spring plants, sometimes planted in wild-garden or rock-garden; one is a salad plant.

Leaves, lower, in a radical rosette, entire; cauline entire, dentate or rarely incise-pinnatifid: cymes sometimes corymbosely paniculate fastigiate, sometimes densely globose at the ends of the branches: fls. whitish, pale bluish, or rose; corolla-tube short or rarely elongate, limb 5-cleft, spreading; stamens 3: fr. 3-celled, 2 of which are empty.—About 58 species, Eu., N. Afr., W. Asia, and N. Amer., mostly in the Medit. region.

Corn salad is both a salad plant and a pot-herb, chiefly the former. The name "corn salad" is probably derived from the fact that the plant grows spontaneously in the grain-fields of Europe, large quantities of it being gathered in early spring. It is rather tasteless compared with lettuce, and is little known in America. Abroad it is prized as a fall and winter salad. It is a cool-season crop, grown like lettuce and matures in six to eight weeks. Plants should stand about 6 inches apart in the row. An ounce of seed should give 2,000 to 3,000 plants. The following description of the varieties is derived from Vilmorin's "Vegetable Garden." See Vol. II, p. 851.

olitòria, Moench. CORN SALAD. LAMB'S LETTUCE. **FETTICUS**. Fig. 3897. An "autumnal annual" herb, the seed of which ripens in April or May, soon falls to the ground, and germinates in Aug. The plant makes its growth in the fall and flowers the following spring. In cult. the seed is generally sown in early spring or late summer. The plant forms a dense rosette of spoon-shaped lvs. which grow in a decussate fashion, and has an angular forking st. bearing small bluish white fls. in terminal clusters. Eu., Orient.—The Round-leaved variety has much shorter lvs. than the common type and they are half-erect instead of spreading, and less prominently veined. This kind is the one grown almost exclusively for the Paris market. The Large-seeded

variety is more robust than the common type and the seed is nearly twice as large; lvs. marked with numerous secondary veins. Much grown in Holland and Germany. The *Etampees* variety has very dark-colored lvs., which are often undulate or folded back at the margins; lvs. narrow, prominently veined, thicker and more fleshy than the other kinds and specially suited to cold weather and long-distance shipment. The cabbaging variety differs from the others in forming a heart or head of fine flavor. Unfortunately it is the least productive type, but it bears shipment well if properly grown.

ericiarpa, Desv. ITALIAN CORN SALAD. Distinguished from the common species by the lighter color of the lvs., which are slightly hairy and somewhat toothed on the edges toward the base. The plant is native to the south of Eu., where it is highly esteemed because it does not run to seed so quickly in a warm climate. It is undesirable for northern climates.

WILHELM MILLER.

VALLÀRIS (perhaps from the latin *vallo*, to inclose; the plants are said to be used in Java for fences).

Apocynaceæ. Twining shrubs, suitable only for the warmhouse in the N., but hardy outdoors in the extreme S. where used as an ornamental. Lvs. opposite, minutely dotted: fls. white, in axillary, subaxillary, or superaxillary dichotomous cymes; calyx 5-parted, glandular or not within, segms. narrow; corolla salver-shaped, lobes broad, overlapping to the right; disk various; carpels 2, at first connate, many-ovuled.—About 5 or 6 species, Trop. Asia and Malaya.

Hèynei, Spreng. (*V. dichótoma*, Wall.). Tall climbing shrub; bark pale: lvs. elliptic, oblong or linear-oblong, $1\frac{1}{2}$ -4 x $\frac{3}{4}$ -1 $\frac{1}{2}$ in., glabrous or pubescent, acuminate: cymes pubescent, 3-10-fld., sessile or peduncled, dichotomous: fls. pure white, $\frac{2}{3}$ in. across, fragrant; sepals ovate-oblong, obtuse; disk ciliate: follicles 6 x 2 in., straight, tapering from a rounded base to a stiff point. Himalaya to Burma and Ceylon.—Intro. into Fla.

VALLISNÈRIA (Antonio Vallisneri, 1661-1730, Italian naturalist). *Hydrocharitaceæ*. Two species of aquatic plants, including the well-known eel-grass or tape-grass. This plant is found in fresh water around the world. It is a submerged plant with linear lvs. $\frac{1}{2}$ -6 ft. long, depending on the depth of the water. The lvs. originate in a tuft at the bottom of the water, and the plant spreads by runners sent out from these tufts. Eel-grass is usually found in quiet waters. It has no horticultural rank, except as an aquarium plant. Like many other aquarium plants, it has special interest for students of botany. The pistillate fls. are borne on very long spiral threads and come to the surface, as shown in Fig. 3898. The staminate fls. are borne on very short stalks near the bottom of the water. At the proper time the staminate fls. break away from their stalks and rise to the surface of the water. As they float about, some of the pollen is conveyed to the pistillate fls., and in this haphazard way the blossoms are fertilized and seed is produced.

3898. Eel-grass.—*Vallisneria spiralis*. (Reduced.)

Both kinds of fls. are very small, and they are borne on separate plants. Eel-grass is readily collected, or can be procured from dealers in aquarium supplies or from collectors of native plants. The plant is sometimes called "wild celery," because it is said to impart a celery-like flavor to wild ducks that feed on it.

spiralis, Linn. EEL-GRASS. TAPE-GRASS. Fig. 3898. Hardy submerged aquatic plant; lvs. thin, linear, 5-nerved, sometimes serrate near the apex; fls. white. Aug., Sept. N. S. to Fla. and westward; Eurasia; Austral. R.B. 20, p. 194. V. 4:157.

WM. TRICKER.

WILHELM MILLER.

VALLÔTA (named for Pierre Vallot, French botanist). *Amaryllidaceæ*. SCARBOROUGH LILY. Green-house tunicate bulb: scape robust, hollow; fls. large, in many umbels, sessile or shortly pedicelled; perianth funnel-shaped, straight, erect, tube short, throat large, lobes oblong-ovate; stamens affixed at the base of the lobes and shorter than them; ovary 3-celled; caps. oblong-ovate, dehiscent from the base.—One species, S. Afr. It has been proposed that Vallota be considered a subgenus of *Cyrtanthus*. The latter is a group of about 20 species of plants with fls. of various colors and naked at the throat. *Cyrtanthus* proper and the subgenus *Monella* have beautiful pendulous fls. in umbels, but the plants are not so easy to grow as Vallota. It has been suggested that they be crossed with the more robust Vallota in the hope of combining their varied colors and pendulous grace with the strong constitution of the Vallota. Such a process would be similar to the one by which the noble race of *Hippeastrum* hybrids has been given to the world. Vallota is undoubtedly related to *Cyrtanthus* through the subgenus *Gastronema*, which has erect fls. and differs chiefly in the stamens. Of this subgenus *C. sanguineus* is in the trade (p. 945). The best form of Vallota seems to be the variety *magnifica*.

The Scarborough lily is generally rated as a greenhouse bulb, but it can be grown by the amateur who has no glass, provided the plant can be kept over winter in a well-lighted cellar. Many persons have had no success with vallota. Such failures are generally due to the plants being kept too dry during winter. Although Baker says the leaves die down at the Cape in autumn, the plant acts like an evergreen in cultivation. Unlike most bulbous plants, the vallota should never be dried off but kept moderately moist about the roots throughout the year. The vallota is also strongly opposed to interference with its roots. It is possible to preserve a flowering specimen in most luxuriant health for three or four years without repotting, simply by applying liquid manure to the roots occasionally during the summer. The culture of vallota is not difficult when its peculiarities are understood. Several years are needed to work up a good plant to the specimen size. A vallota bulb is about twice as large as a hyacinth. For the first potting use a light soil, with a little sand at the base of the bulb, and place the bulb a distance below the surface equal to its own diameter. Use as small a pot as possible at every stage; shift only when the soil is well filled with roots and be careful to break no roots when shifting to a larger pot. The final potting is an important operation, as the plant is not to be disturbed again for three or four years. Drainage should be ample and perfect. It is essential that the potting soil be of a strong permanent nature and rich in plant-food. A good compost consists of turfy loam, fibrous peat and old cow-manure in equal parts. Add a little sand and charcoal. Avoid repotting until it is strictly necessary, and do so only when it is required to increase the number of plants or when there is danger of the roots breaking the pot. For amateurs the best time to repot the plants is directly after the flowering period. Use the

greatest care in handling the roots. Allow the bulbs to project a little beyond the surface. Some gardeners prefer to repot vallota in June or July when root-action has started, but before the flower-stems have pushed up. Vallota likes full sunshine at all times of the year. The plant will stand a few degrees of frost in winter. Beware of over-potting; it is better to have the bulbs crowd one another out of the pot. Amateurs sometimes raise vallotas in the window-garden, one bulb in a 6-inch pot with one or two flower-stalks, but a large specimen is well worth years of care. The Scarborough lily has been cultivated by rich and poor for over a century. Its popular name is supposed to have been derived in same way as the Guernsey lily,—a Dutch bark having been wrecked off the coast of England, some bulbs washed ashore and became established as garden plants. Vallota is considerably grown for the London market, and it is said that some growers succeed in blooming their plants twice the same year, in winter and summer. At the Cape, the species is said to be native to peat-bogs, which fact would account for the special winter treatment which it needs. In California the plant blooms at various times of the year. (Michael Barker.)

purpurea, Herb. SCARBOROUGH LILY. Fig. 3899. Bulb large: lvs. appearing with the fls., strap-shaped, $1\frac{1}{2}$ –2

3899. Scarborough lily.—*Vallota purpurea*.

(From a specimen 2 feet high.)

ft. long, dying down in autumn: peduncle hollow, slightly 2-edged, 2–3 ft. long; fls. scarlet. G. 1:36; 3: 479; 9: 331; 10: 77; 37: 89. Gn. 30, p. 245; 42, p. 273; 59, p. 44; 68, p. 385; 71, p. 544. G.Z. 15:32. J.H. III. 45: 453. R. H. 1870:50 (as *V. grandiflora*). A. F. 9:211. Gng. 2: 361. A. G. 14: 81. — The typical form has the scapes about $1\frac{1}{2}$ ft. high and blood-red fls. $2\frac{1}{2}$ in. across. Var. *alba*, Hort., is a white-flid. form. G.C. III. 36:150. Var. *major*, Hort., is 3 ft. high and has fls. over 3 in. across. B.M. 1430 (as *Amaryllis purpurea*). Var. *minor*, Hort., is smaller than the type in all parts. B.R. 552 (as *Amaryllis purpurea* var. *minor*). Var. *eximia*, Bull., has fls. 4 in. across, with whitish, feather-like blotches on the base of the perianth-segms. Var. *magnifica*, Hort., is probably the best and most robust form: fls. 5 in. across, with a white eye. Colors said to be brighter and more uniform than in any other kind. Gn. 30:244. G.C. III. 3:240.—*V. purpurea* is a S. African representative of the American genus *Hippeastrum*, popularly known as "amaryllis." It is a bulbous plant with large red funnel-shaped 6-lobed fls., blooming in Sept. and later. A pair of well-grown specimens in large pots or tubs make a showy ornament for the porch. Plants have been grown with over 50 fl.-trusses, each truss bearing an umbel of 4–9 fls., the individual fls. being 3–4 in. or more across. Vallota is a monotypic genus and is distinguished from *Hippeastrum* by the seeds being winged at the base. The tube of the fl. is longer than in the typical *Hippeastrum* and at the base of each perianth-segm. is a cushion-shaped callus somewhat different from the minute scales or distinct neck that is often found at the

throat of a *Hippeastrum*. The plant deserves to be better known among amateurs and cottagers.

hybrida, Hort. Bull., is a hybrid between *Vallota purpurea* and *Cyrtanthus sanguineus*, which is intermediate in character between the two parents, both in foliage and fls., the latter being borne in umbels and a uniform bright orange-vermilion in color.

WILHELM MILLER.
F. TRACY HUBBARD.†

VANCOUVERIA (after Capt. George Vancouver, commander of the Discovery in the voyage to the north-west coast in 1791-1795). *Berberidaceæ*. Low hardy perennial herbs, grown in the garden border.

Rhizome creeping: lvs. pinnate, 2-3-ternately compound: scape leafless, racemose or somewhat paniculate at the summit: sepals 6, in 2 rows, obovate, petal-like, reflexed; petals 6, ligulate; stamens 6: fr. a follicle, dehiscent by a dorsal suture.—Three species, natives of the Pacific coast of N. Amer. The lvs. are somewhat like maidenhair or rue, and the fls. are rather small and white or yellow. *Vancouverias* demand a rich soil in rather shady positions. They are not showy plants, but have foliage of an elegant and refined type.

hexandra, Morr. & Decne. About 1 ft. high: root-stock woody, slender: lfts. roundish, mostly angulately 3-lobed and cordate: scape naked or 1-lvd.: panicle simple or loose-branched: fls. white or cream-colored. May, June. Coniferous woods, Brit. Col. to N. Calif. near the coast. Gn. 30, p. 263.

chrysantha, Greene (*V. hexandra* var. *aurea*, Rattan). About 1 ft. high: lfts. evergreen, rather 3-lobed, usually whitened and pubescent beneath: infl. subracemose: fls. somewhat larger than in *V. hexandra*. Ore.

parviflora, Greene. **INSIDE-OUT FLOWER.** From 8-20 in. high: lvs. glabrous or with rusty hairs, persisting through winter; lfts. thickish, roundish in outline, broadly cordate at base, obscurely or evidently 3-lobed with a notch at summit of each lobe: panicle bearing 25-55 white or lavender-tinged fls. Coniferous woods, Calif.

F. TRACY HUBBARD.†

VÁNDA (native name in India). *Orchidaceæ*. One of the most attractive groups of East Indian orchids, nearly all species having large handsome flowers.

Dwarf and short-stemmed or tall and branched, sometimes climbing to a considerable height; erect species forming compact plants, with sts. and branches well clothed with 2 opposite rows of lvs.; species like *V. teres* with a loose straggling habit: lvs. flat or channeled and keeled or terete, sometimes fleshy and deeply channeled; apex pointed, lobed or toothed: fls. in racemes from the axils of the lvs.; sepals and petals similar, spreading, narrowed at the base almost to a claw; labellum firmly united to the column, spurred, lateral lobes small, erect, middle lobe spreading; pollinia on a common stipe.—About 25 species, natives of India and the Malay Isls., with outlying species in China and New Guinea.

Notwithstanding the various conditions surrounding the different species of vanda in their natural habitats, the plants may nearly all be cultivated successfully under the same general treatment. When a general collection is grown, a house of east and west exposure will be found best suited to the wants of vandas. The plants require plenty of light and do not need any shade from November until the middle of February. A house of east and west aspect will require less shading during late fall and early spring than one of southern exposure, and there will be fewer ill effects from direct solar heat at all times. From February until November shading will be necessary, but it should never be too heavy or black-spot is likely to appear. The winter temperature should range from 60° to 65° F. by night and 70° to 75° by day, with a gradual increase of 10° during the summer months. A few degrees more with

solar heat and ventilation will do no harm. The atmosphere must be kept moist by damping the benches and paths freely once or twice a day, and ventilation should be given whenever possible, in greater or less degree according to outside conditions. Especially during wet cheerless weather is ventilation important, even if fire heat has to be applied to retain the desired temperature. Vandas may be grown well in either pots or baskets, but the latter are preferable, as they admit air more freely to the roots, whereby they are not so liable to decay from overwatering during severe weather. The best potting or basketing material consists of chopped live sphagnum moss freely interspersed with large pieces of charcoal. This material should be pressed in rather firmly about the roots, leaving a convex surface when finished. A plentiful supply of water is essential at all seasons with copious syringing over the foliage in bright weather. The compost should never be allowed to remain dry for a long time. *V. tricolor* and similar species grow very well among foliage plants in the warm-house, where their large aerial roots, which are freely emitted from the sides of the stems, may ramble among the foliage and thereby retain moisture a long time after syringing. A few species, such as *V. Amesiana*, *V. cærulea*, and *V. Kimballiana*, with one or two other alpine species, require about 10° cooler temperature, but otherwise similar treatment to other species of the genus. Stock is increased by removing a foot or more of the leading growth with a sharp knife, allowing several roots to remain attached to each growth and basketing them in the usual manner. These new pieces should be frequently syringed overhead until they become established or they are likely to shrivel. The old stems will nearly always send out several new growths. The principal insect enemies of vandas are several species of scale, which breed fast in a dry atmosphere. They can be kept in check by syringing with strong tobacco-water and by sponging the plants with a 20 per cent solution of alcohol. (Robt. M. Grey.)

KEY TO THE SPECIES.

- A. *Labellum spurred.*
- B. *Lvs. flat, or channeled and keeled, toothed or lobed at the apex.*
- C. *Racemes loose: labellum with lateral lobes.*
- D. *Fls. 1-1½ in. across.*
- E. *Color blue.*..... 1. *cærulescens*
- EE. *Color yellow.*..... 2. *parviflora*
- EEE. *Color white or pale yellow, but streaked and shaded with brown.*..... 3. *spathulata*
- DD. *Fls. 2 in. or more across (sometimes less in Nos. 8 and 11).*
- E. *Color blue.*..... 4. *lamellata*
- EE. *Color white.*..... 5. *Boxallii*
- EEE. *Color white or yellowish, but spotted with purple or brown.*
- F. *Middle lobe of the labellum dilated, reniform.*..... 6. *cærulea*
- 7. *Denisoniana*
- 8. *Bensonii*
- 9. *insignis*

FF. Middle lobe slightly dilated,
truncate or emarginate.

G. Apex emarginate or 2-
lobed.....10. tricolor
11. Roxburghii

GG. Apex truncate and ob-
scurely mucronate....12. limbata

FFF. Middle lobe shorter than
the sepals, flabelliform....13. Parishii

CC. Raceme dense, cylindrical: label-
lum without lateral lobes.....14. densiflora

BB. Lvs. semi-terete and deeply chan-
neled, pointed.....15. Amesiana
16. Kimballiana

BBB. Lvs. terete.....17. teres
18. Hookeriana

AA. Labellum not spurred.....19. Cathcartii
20. Sanderiana

1. *cærulescens*, Griff. St. 1-2 ft. high: lvs. 5-7 in. long, deeply channeled, truncate and 2-lobed at the apex: racemes many, slender and pendulous, each bearing about 12 fls.: fls. 1 in. across; sepals and petals obovate, subacute, undulate or twisted, pale lilac-blue; labellum shorter than the sepals, middle lobe cuneate-obovate, with a delicate 2-lobed tip, violet with fleshy dark blue ridges, side lobes small, dark blue. Spring. Burma. B.M. 5834. F.M. 1877:256. G.C. 1870:529. C.O. 13.—Color varies from blue to nearly white. Var. *Bóxallii*, Reichb. f. Fls. pale violet or nearly white; disk of the labellum deep violet with white lines on the sides. B.M. 6328. C.O. 13a. Var. *Hennisiæna*, Schlecht. Fls. similar in color to *V. cærulea*, with dark blue lip, and slender spur about $\frac{1}{2}$ in. long. Var. *Regniéri*, André. Fls. deeper colored. R.H. 1900:634.

2. *parviflora*, Lindl. St. 4-6 in. high: lvs. strap-shaped, 4-8 in. long, unequally obtusely 2-lobed: racemes erect, many-fld.: fls. small, yellow; sepals and petals obovate-spatulate; labellum shorter than the sepals, middle lobe obovate, dilated, truncate, and 2-lobed at the apex, yellow below, white above, spotted and dashed with purple and having thick fleshy ridges. Himalayas. B.M. 5138 (as *Aërides Wightianum*).

3. *spathulata*, Spreng. St. 2 ft. high: lvs. 2-4 in. long, obtusely 2-lobed; peduncle robust, 12-18 in. tall, few-fld.: fls. $1\frac{1}{4}$ in. across, golden yellow; sepals and petals oblong-spatulate, flat; labellum as long as the sepals, clawed, side lobes very small, broadly obovate, middle lobe suborbicular, obscurely 3-fid. Ceylon, India.

4. *lamellata*, Lindl. Lvs. channeled, leathery, obliquely and acutely bifid at the apex: fls. pale yellow, stained with red; sepals and petals obovate, obtuse, undulate, the lower sepal larger and somewhat incurved; middle lobe of the labellum obtusely, retuse, auriculate, having a pair of red elevated plates and 2 red tubercles just below the apex. Aug.-Nov. Philippines.

3900. *Vanda cærulea*. ($\times \frac{1}{2}$)

5. *Bóxallii*, Reichb. f. (*V. lamellata* var. *Bóxallii*, Reichb. f.). St. tall, with long recurved lvs.: raceme longer than the lvs., bearing 14-20 fls.: sepals white, with the lower margins of the lateral pair sepia-brown; petals white, with violet streaks which are also found on the sepals, pandurate with large lamellæ and square auricles, mostly lilac. Nov., Dec. Philippines. G.C. II. 15:87. Gn. 19:574. C.O. 9.

6. *cærulea*, Griff. Fig. 3900. St. 1-2 ft. high: lvs. rigid, linear, 6-10 in. long, obliquely truncate and toothed at the tip; raceme 1-2 ft. long: fls. 3-4 in. across, pale blue; lateral sepal obovate; petals broadly obovate, clawed; labellum less than one-third the length of the sepals, dark blue, linear-oblong, side lobes small, rounded, middle lobe with 2 thickened ridges. Late autumn. India. F.S. 6:609. I.H. 7:246. Gn. 21:254; 31, p. 566; 47, p. 145; 50, pp. 59, 418; 52, p. 410. R.B. 17:265. G.C. III. 3:41; 7:17; 11:272; 44:374; 45:264. Gng. 3:135; 15:132. G.F. 3:77. A.F. 6:685; 25:1092; 27:1136. Gn.W. 11:377. J.F. 1:102. C.O. 5. G. 18:66. F.R. 1:371. R.H. 1881:290 (as var. *grandiflora*).—This is considered to be one of the best species in cult. The fls. are often tessellated. Var. *albens*, Hort. Sepals and petals pure white, with slight tinge of reddish purple at tips. Var. *albídula*, Hort. Fls. white with blue veining on lip. Var. *blenheimensis*, Hort. Fls. closely veined with pure blue on white ground. Var. *Cháriesworthii*, Hort. Fls. entirely pure white except a little yellow on base of lip. G.M. 51:831. O.R. 1908:361. Var. *Peetersiæna*, Cogn. Sepals and petals very pale rose-lilac, lip rose. C.O. 5a. Var. *Rógersii*, Hort. "A distinct, nearly white variety, with fls. of moderate size and an unusually long spur." Var. *Sánderae*, Hort. Tips and margins of sepals tinged with magenta-pink, the petals flushed with same color; lip deep magenta. G.C. III. 48:415. Var. *Wriglei*, Hort. Fls. smaller than type; sepals and petals pure white; lip rose-pink.

7. *Denisoniæna*, Benson & Reichb. f. St. short: lvs. linear, 6-10 in. long, recurved, deeply notched at the apex: peduncles short, stout, bearing 4-6-fld. racemes: fls. white, 2 in. across; sepals and petals waved and twisted, the lateral sepals broadly obovate, falcate; petals clawed, spatulate; labellum longer than the sepals; side lobes large, subquadrate; middle lobe panduriform, with 2 orbicular, diverging, terminal lobes. Summer. Burma. B.M. 5811. I.H. 19:105. F. 1869, p. 250. G.C. II. 24:105. A.F. 6:607. C.O. 8.

8. *Bénsonii*, Batem. St. about 1 ft. high, very leafy: lvs. linear, leathery, 6-8 in. long, obliquely toothed at the apex: fls. 2 in. across, 10-15 in a raceme, 1-1½ ft. long; sepals and petals obovate, obtuse, clawed, white outside, yellowish green with numerous brown dots inside; labellum violet, with white spur and side lobes, middle lobe terminating in a reniform, bifid apex. Summer. Burma. B.M. 5611. F.S. 22:2329. G.C. 1867:180. C.O. 2.

9. *insignis*, Blume. St. erect: lvs. linear, 10 in. long, apex with 2 or 3 teeth: raceme rather short, 6-10-fld.: fls. 2-2½ in. across; sepals and petals obovate, fleshy, the petals narrower, ochraceous brown, with darker brown blotches inside, almost white on the outside; labellum pandurate, the apical lobe being broadly reniform, concave, white tinted with rose. Summer. Malaya. B.M. 5759. Gn. 25:168. C.O. 3. Var. *Schroederiæna*, Hort., has yellow fls. with a white labellum, and 2 orange spots in front of spur. Gn. 25:168.

10. *tricolor*, Lindl. St. branched, tall, erect and leafy: lvs. strap-shaped, 10–12 in. long, channeled: raceme drooping, longer than the lvs.: fls. 2–3 in. across; sepals obovate, attenuated at the base, yellow with numerous brownish crimson spots; petals similar to the sepals in form and color but narrower; labellum about as long

3901. *Vanda tricolor* var. *suavis*.

as the sepals, lateral lobes small, rounded; middle lobe lyrate, notched, purple, with elevated lines. F.S. 6:641. I.H. 42, p. 161. B.M. 4432. J.F. 2:136. C.O. 6. Var. *suavis*, Hort. (*V. suavis*, Lindl.). Fig. 3901. Ground-color of the fls. white; sepals and petals spotted with purple; labellum deep purple. Fls. irregular from March to May. Java. B.M. 5174. F.S. 5, p. 510; 6:641. Gn. 3, p. 103; 23, p. 134 (as *V. tricolor*); 31, p. 242; 47:272. I.H. 42, p. 162. G.C. II. 22:237 (var.); III. 7:133 and 135. C.O. 4. Var. *Veitchii*, Hort. Fls. with rather large spots of deep rose; labellum deep rose. R.B. 20:145. Var. *Patersonii*, Hort. Sepals and petals creamy white, heavily spotted with brown; labellum magenta-crimson. Gn. 23:134. Var. *Cornigii*, Hort. Sepals and petals bright yellow, spotted with deep crimson and bordered with rose-purple on both sides; labellum deep violet. Var. *tenebrösa*, Hort. Sepals and petals yellow marked with dark red-brown; labellum rose-crimson. J.H. III. 47:3. Vars. *Robinsoniana*, *grandis*, *splendens*, and *superba*, Hort., are also advertised.

11. *Roxburghii*, R. Br. (*V. tessellata*, Hook.). St. 1–2 ft., climbing: lvs. narrow, complicate, 6–8 in. long, 2–3-toothed at the apex: racemes erect, 6–8-fl.: fls. greenish yellow, tessellated with olive-brown inside, white outside; sepals and petals subequal, clawed, obovate, waved; labellum nearly as long as the sepals, lateral lobes small, acute, middle lobe panduriform, violet, truncate. May–Aug. Bengal. B.R. 506. B.M. 2245. F.S. 2:75; 6, p. 330. I.H. 32:579 (var. *rubra*). P.M. 7:265. Var. *cærulea*, Hort., is advertised.

12. *limbata*, Blume. St. about 3 ft. high: lvs. linear, keeled, 6–8 in. long, unequally bifid at the apex: racemes 10–12-fl., 6–8 in. long on peduncles of equal length: fls. 2 in. across; sepals and petals spatulate, bright cinn-

mon, tessellated, bordered with golden yellow, white suffused with lilac outside; middle lobe of the labellum oblong-pandurate, truncate, mucronate, pale lilac. June, July. Java. B.M. 6173.

13. *Pârisii*, Reichb. f. St. very short: lvs. few, 8–10 in. long, 2–3 in. wide, obtusely 2-lobed: raceme drooping, 6–8-fl., on a short peduncle: fls. 2 in. across, fleshy, greenish yellow, freely spotted with reddish brown; sepals broadly ovate-oblong; petals orbicular; labellum half as long as the sepals, white striped with orange at the base; lateral lobes rounded, middle lobes flabelliform. Summer. Moulmein, India. C.O. 11. Var. *Mariottiana*, Reichb. f. Sepals pale mauve with numerous darker blotches outside, petals mauve; both sepals and petals are mauve inside; labellum white at base, with yellow spots and mauve lines. C.O. 11a.

14. *densiflora*, Lindl. (*Saccolabium giganteum*, Lindl.). St. short, thick: lvs. very thick, 6–12 in. long, notched: raceme dense, cylindrical, about as long as the lvs., nodding: sepals white, cuneate-ovate, subacute; petals narrower, with few purple spots at the base; labellum cuneate, obtusely 3-lobed, with 2 pubescent ridges at the base, terminal lobes bright shining purple. Winter. Burma. B.M. 5635. F.S. 17:1765. C.L.A. 6:164. Var. *illustris*, Reichb. f. Raceme and fls. larger: sepals and petals spotted with purple; labellum bright purple. I.H. 31:517.

15. *Amesiana*, Reichb. f. St. very short and stout: lvs. fleshy, rigid, almost terete, with a groove down the center, 6–12 in. long: raceme simple or branched, erect, 1–2 ft. long and bearing 20–80 fls.: fl. $1\frac{1}{2}$ in. across, white, with rose-colored ridges on the labellum, sepals and petals ovate-oblong, obtuse; labellum with a broadly cuneate, undulate middle lobe, having 5 ridges converging into a reflexed callus, side lobes small, rounded. Flowers at various seasons. India. B.M. 7139. J.H. III. 29:491; 33:271; 48:315. G. 32:183. C.O. 1. A.F. 6:441. Var. *albena*, Hort. Fls. almost entirely white.

16. *Kimballiana*, Reichb. f. Fig. 3902. St. 6 in. high, probably climbing to a great height: lvs. 6–10 in. long, terete, with a deep, narrow furrow; peduncle slender,

3902. *Vanda Kimballiana*. ($\times \frac{1}{2}$)

6-10 in. long, bearing a drooping raceme 8-10 in. long: fls. 2-3 in. across; petals and dorsal sepal obovate-spatulate, lateral sepals very much larger, oblong, falcate, all pure white; labellum smaller than the lateral sepals, middle lobe orbicular, notched, rose-purple with darker veins, margin erose-toothed, lateral lobes small, yellow; spur 1 in. long, curved. Autumn. Burma. B.M. 7112. Gn. 37:322. R.H. 1897:352. Gt. 45:1428 and p. 338. J.H. III. 20, p. 41; 29, p. 53. G.C. III. 6:335; 17:69; 31:384. G. 29:669. C.O. 7. A.G. 12:89. Var. *alba*, Hort. Fls. white with yellow base to lip.

17. *teres*, Lindl. Fig. 3903. St. long, climbing: lvs. terete, 6-8 in. long; peduncle 6-12 in. long, bearing a 3-6-fld. raceme: fls. 4 in. across; sepals nearly orbicular, white tinged with rose; petals a little larger, deep rose; side lobes of the labellum broad, incurved, yellow spotted with crimson, middle lobe exceeding the sepals, fan-shaped, reniform, purple or rose-colored. May-Sept. Burma. B.M. 4114. B.R. 1809. P.M. 5:193. R.H. 1856:421. Gt. 43:1404. G.C. II. 20:273; III.

3903. *Vanda teres*. (Detached flower $\times \frac{1}{2}$).

27:307. G.M. 43:298. C.O. 10. S.H. 2:385. Gn. 42:276.—A plant of straggling habit, but with very beautiful fls. Var. *Andersonii*, Hort., has fls. larger and more highly colored. Var. *alba*, Hort. Fls. white. G. 36:373.

18. *Hookeriæna*, Reichb. f. St. and lvs. terete, as in *V. teres*, but the latter only 2-3 in. long, and slender: fls. 3-5 in. across; dorsal sepal and petals white, dotted with purple; lateral sepals narrower, oblong or somewhat obovate, white; labellum as large as the rest of the fl., side lobes incurved, white and purple, middle lobe fan-shaped, with 3 large lobes, white spotted purple. Sept. Borneo. I.H. 30:484. Gn. 23:10. G.M. 40:645. Gn.W. 8:53.—In cult. racemes usually 2-fld.

19. *Cathcartii*, Lindl. St. 1-2 ft.: lvs. linear-oblong, 6-8 in. long, unequally bifid at the tips: racemes longer than the lvs., 3-6-fld.: fls. $2\frac{1}{2}$ in. across, orbicular in outline; sepals and petals nearly equal, orbicular-oblong, concave, pale straw-colored, transversely streaked with numerous narrow red-brown lines; labellum shorter than the sepals; lateral lobes quadrate, incurved, white with red streaks; middle lobe reniform, margin white, slightly crenate, center thick, yellow with a crenate border. Spring. Himalaya. B.M. 5845. F.S. 12:1251. G.C. 1870:1409. Gn. 19, p. 351; 33, p.

224; 42, p. 276. R.H. 1900:452.—Found near waterfalls, where it is always kept damp.

20. *Sanderiæna*, Reichb. f. St. very leafy: lvs. rigid, fleshy, recurved, 1 ft. long, strap-shaped, truncate, with 2-3 teeth at the apex: raceme bearing about 12 fls. each 5 in. across, with the broad sepals and petals overlapping: sepals orbicular, the dorsal one smaller, pale lilac, dotted at the base, the lower pair tawny yellow veined and tessellated with brownish crimson; petals smaller, rhomboid obovate, colored like the dorsal sepals; lateral lobes of the labellum forming a cup-like base, middle lobe subquadrate, reniform, much smaller than the sepals, dull crimson. Sept. Philippines. B.M. 6983. I.H. 31:532. R.H. 1885:372. Gn. 25:104; 32, p. 399; 49, p. 88; 50, p. 480. J.H. III. 35:535; 57:149; 63:505; 69:199. F.E. 23:454. O. 1909:105. C.O. 12. G.C. II. 20:440. Gng. 6:115.—A very remarkable free-flowering species. Var. *Froebeliæna*, Cogn. Fls. very large, nearly circular in outline, richly colored. Var. *roseo-alba*, Hort. Upper sepal and petals nearly white with purple spots; lower petals greenish with purple veining.

V. Batemannii, Lindl.=*Vandopsis lissochiloides*.—*V. cathartica*, Hort., is presumably an error for *V. Cathcartii*.—*V. confusa* is a new name proposed for *V. cærulescens* var. *Boxallii*.—*V. cristata*, Lindl. Sts. erect: sepals and petals yellow-green, the petals incurved; lip buff, striped with rich purple. B.M. 4304. B.R. 28:48.—*V. Dallenæ*=*V. lamellata* $\times$ *V. Boxallii*.—*V. Fløyegæ*. A natural hybrid. Resembles *V. cærulea* in habit, but fls. smaller, white with violet lip.—*V. gigantæa*, Lindl.=*Vandopsis gigantea*.—*V. Löveli*, Lindl.=*Renanthera Lowei*.—*V. Marbana*=*V. teres* $\times$ *V. tricolor* var. *suavis*.—*V. Niemannii*.—*V. præmorsa*.—*V. pumila*, Hook. f. Lvs. 4-8 in. long; racemes 3-fld.: fls. fragrant, ivory-white, 2-2½ in. across, the lip crimson-striped; sepals and petals oblong-spatulate. Sikkim. B.M. 7968.—*V. striata*, Reichb. f.=*V. cristata*.—*V. Watsonii*, Rolfe. About 1 ft. tall: lvs. subterete, acute, up to 14 in. long, dark green spotted with brown on sheath: scape brown-spotted, 10-12-fld.: fls. white, the crest and interior of sac yellow spotted brown; sepals and petals obovate-spatulate; lip 3-lobed, the front lobe oval, fimbriate. Annam. B.M. 8109. G.C. III. 37:123; 43:131, 132.

HEINRICH HASSELBRING.

GEORGE V. NASH.†

VANDÓPSIS (like *Vanda*). *Orchidaceæ*. Includes two or three species of orchids which formerly have been united with *Vanda* or with *Stauroopsis*. They are distinguished from allied genera by the labellum, which is firmly united with the column, not spurred, concave at the base, with the terminal lobe compressed laterally. In appearance these plants resemble robust *vandas*, with which they are usually classed for horticultural purposes. Treatment the same as for *vanda*.

lissochiloides, Pfitz. (*Vanda Batemannii*, Lindl.). Fig. 3904. St. 1-5 ft. high: lvs. strap-shaped, obliquely emarginate, 2 ft. long: raceme tall, erect, bearing 12 and more fls.: sepals and petals obovate, yellow, spotted with brownish crimson, purple outside; labellum crimson-purple or yellowish. July-Sept. Philippines. B.R. 32:59. F.S. 18:1921.—By some authorities retained in *Stauroopsis*, and so described on p. 3233.

gigantæa, Pfitz. (*Vanda gigantæa*, Lindl.). St. pendulous: lvs. 1-2 ft. long, thick, flat, obtusely notched: raceme 10-15 in. long, decurved, many-fld.: fls. 3 in. across, golden yellow, blotched with cinnamon; sepals and petals spatulate-obovate; labellum white. Burma. B.M. 5189. I.H. 8:277. R.H. 1874:290.

HEINRICH HASSELBRING.

VANGUËRIA (the Madagascan name of *V. madagascariensis* is *Voa-Vanguer*). *Rubiaceæ*. Shrubs or trees, sometimes spiny or somewhat climbing in habit, adapted to the greenhouse and may be hardy in the extreme southern United States.

Leaves opposite or rarely pseudo-verticillate in 4's, oval: fls. small, white or greenish, in axillary clusters; calyx 5- or 4-lobed, lobes deciduous or rarely persistent; corolla hairy or not outside, usually furnished inside with a ring of deflexed pilose hairs; lobes spreading or reflexed; stamens 5, rarely 4; disk fleshy or depressed; ovary 5-3-celled; ovules solitary; fr. drupaceous;

pyrenes 5-3 in number or putamen 5-3-celled.—About 70 species, tropical and subtropical regions of the world, Austral. excepted. Considered a section of *Epimedium* by Prantl, in Engler & Prantl, *Pflanzenreich* III. 2.

The voa vanga of Madagascar is a tropical fruit that has been recommended by the American Pomological

3904. *Vandopsis lissochiloides*.

Society as worthy of cultivation in southern Florida. The fruit is imperfectly described in horticultural writings. It is said to be a delicious berry $\frac{3}{4}$ inch thick, but in Mauritius it becomes $1\frac{1}{2}$ inches thick. It is a globose drupe, shaped something like an apple and contains five large "stones" or bony pyrenes. The plant is a shrub 10 to 15 feet high. The species is widely spread in the tropics of the Old World. It was introduced to American horticulture by A. I. Bidwell, of Orlando, Florida. In 1887, the late H. E. Van Deman reported that the shrub grew exceedingly well, sprouting readily from the roots when frozen down. It grows readily from imported seeds.

madagascariensis, J. F. Gmel. Glabrous shrub, 10-15 ft. high: lvs. very large, oblong, obtuse or acute, membranous, short-petioled: fls. in copious, peduncled, axillary dichotomous cymes; corolla funnel-shaped, $\frac{1}{4}$ in. long, with 5 spreading deltoid teeth. Madagascar.

infusta, Burch. Shrub, 4-10 ft. high, tawny-tomentose, unarmed, sometimes a small tree: lvs. ovate, oval, or suborbicular, horizontal, usually rounded or obtuse at base, greenish above, rather paler beneath: fls. greenish, 5-merous, $\frac{1}{4}$ in. long; calyx-lobes ovate or oval; corolla-tube cylindrical, glabrous, lobes ovate; ovary 5-3-celled: fr. globose, smooth, glabrous. Trop. Afr. B.M. 3014 (as *V. velutina*).—Fr. said by some to be edible. Intro. into S. Calif. F. TRACY HUBBARD.†

VANHOÛTTEA (named for Louis Van Houtte, a Belgian nurseryman). Syn., *Hoïttea*. *Gesneriaceæ*. Low branching appressed-hairy shrubs, probably adapted only to warmhouse culture: lvs. opposite, fleshy,

crowded at the ends of the branches, lower surface more or less canescent-felt; fls. solitary, axillary, long-pedicelled, red or speckled; calyx-tube adnate to the ovary, 5-ribbed, lobes elongated, acute; corolla-tube elongated-cylindrical, lobes 5, rounded, spreading disk broad with 5 glands, the 2 posterior usually grown together; ovary almost entirely inferior: caps. with a twisted beak. About 5 species, Brazil. *V. calcarata*, Lem. (*Hoïttea pardina*, Decne. *Gesnera pardina*, Hook.). St. about $1\frac{1}{2}$ ft. high, erect, rather stout, terete, brown, branched: lvs. rather stoutly petioled, elliptical, acute, rather thick and fleshy, strongly serrated, downy above and more so beneath: peduncle axillary, solitary, 1-fl., shorter than the lvs.: calyx-tube turbinate, adherent with the lower part of the ovary, segms. large, acute, spreading; corolla $1\frac{1}{2}$ in. or more long, ochre-red, yellow within, spotted with deep red, especially the limb and tube inside; ovary semi-inferior, hairy, with 5 yellow glands. Brazil. B.M. 4348. H.U. 6, p. 289. Cult. probably as for achimenes and similar plants. F. TRACY HUBBARD.

VANILLA (Spanish, *little sheath or pod*). *Orchidaceæ*. **VANILLA**. Climbing orchids whose branched stems ascend to a height of many feet, ornamental but known mostly as the source of vanilla used for flavoring and which is produced from the seed-pods.

Nodes bearing lvs. or scales and aerial roots in alternate arrangement: fls. in axillary racemes or spikes, without an involucre at the top of the ovary; sepals and petals similar, spreading; labellum united with the column, the limb enveloping the upper portion of the latter; column not winged.—About 20 species in the tropics. The genus was monographed in 1896 by R. A. Rolfe in *Journ. Linn. Soc.*, vol. 32.

The most important species is *V. planifolia*, the vanilla of commerce. It is a native of Mexico, but is now widely cultivated in the West Indies, Java, Bourbon, Mauritius, and other islands of the tropics, its chief requirement being a hot damp climate. The plants are propagated by cuttings varying in length from 2 to about 12 feet, the longer ones being the more satisfactory. These are either planted in the ground or merely tied to a tree so that they are not in direct connection with the earth. They soon send out aerial roots, by which connection with the soil is established. They are usually trained on trees so that the stems are supported by the forked branches, but posts and trellises are also used as supports. In most places where vanilla-culture is practised, pollinating insects are lacking and the flowers must be pollinated by hand. Plants bear their first fruit about three years after setting. They then continue to fruit for thirty or forty years, bearing up to fifty pods annually. The vanilla pods are picked before they are ripe, and dried. The

3905. *Vanilla planifolia*. Cluster of flowers about 4 inches across. (The pod $\times \frac{1}{2}$).

vanillin crystallizes on the outside. For a full description of vanilla culture and methods of curing the pods, see Bulletin No. 21, United States Department of Agriculture, Division of Botany, by S. J. Galbraith. Vanillin is also made from other sources by chemical means.

planifolia, Andr. (*V. aromatica*, Willd., in part). COMMON VANILLA. VANILLA BEAN (from the pods). Fig. 3905. Tall climbing herbs with stout sts.: lvs. thick, oblong-lanceolate, acuminate, with short, stout petioles: fls. yellow, large, in axillary racemes of 20 or more blossoms; sepals and petals oblanceolate; labelum trumpet-shaped, with small, reflexed, crenulate lobes. Winter. A native of Mex., but widely cult. throughout the tropics and in greenhouses. B.M. 7167. L.B.C. 8:733. G.C. III. 25:213. Gn. 57, p. 35. O. 4:8.—Partially epiphytic.

aromatica, Sw. St. angular: lvs. broadly ovate, with a bluntish point, contracted at the base: fls. greenish and white. Jamaica, Colombia, Trinidad.

V. Eggerii, Rolfe. Sts. thick: lvs. abortive, oblong-lanceolate: sepals and petals greenish; lip white or lilac. W. Indies.—*V. grandifolia*, Lindl. Lvs. 7 in. long, 5 in. broad, narrowed at base into more or less elongated petiole: fls. very large. W. Trop. Afr.—*V. Humboldtii*, Reichb. f. Fls. bright yellow, about 5 in. across, with brown markings on lip and rosy hairs in throat. Madagascar. B.M. 7996.—*V. Lutea*, Walden. Lvs. resembling *V. planifolia*: fls. very large. Congo.

HEINRICH HASSELBRING.

GEORGE V. NASH.†

VARIATION: See *Breeding*, page 547.

VARIEGATION. This term is usually applied to a class of variations, especially in leaf-coloration, in which the leaves become striped, banded, spotted, and blotched with yellow, white, red, and various other colors in connection with the normal green of other portions of the leaves. In the case of yellow-and-white variegation, the term albinism is sometimes used, especially when the plants are largely marked with white or yellow, as in *Abutilon Sellovianum*, *Pelargonium zonale*, and variegated forms of *Evonymus japonica*, *Hydrangea hortensis*, *Hedera helix*, *Polyscias Guilfoylei* var. *Victorix*, and others.

Among the dracenas, caladiums, and codieums, besides the white variegation, there are developed beautiful

reds, pinks, yellows, and so on. As a rule, the term variegation is not used in cases of color-variation in which only the surface of the leaf is involved, as in many of the begonias, sansevierias (*S. thyrsiflora* and *S. zeylanica*), *Alocasia cuprea*, *Cissus discolor*, and others. In many such plants the markings are due in part to hairs, scales, or air in the cuticle or epidermal cells, as in sansevieria and begonia. In some begonias, many varieties of calathea (as *C. ornata* var. *albo-lineata*), the epidermal cells develop decided and definite color-variation, though the changes do not usually

involve the mesophyl or inner cells of the leaf. In some genera, however, especially calathea, all gradations are found between purely epidermal variegation and changes involving the deeper layers of the leaf, as in *C. Veitchii* and *C. Makoyana*. The same is true of many other genera. Different kinds of variegation are shown in Figs. 3906, 3907.

True variegations may be distinguished from ordinary colorations, bleaching, chlorosis, and the like, by the fact that the colored areas are usually quite sharply defined. They do not gradually blend into each other, but have definite boundaries. Cells in the variegated areas are found, as a rule, to contain the same chlorophyll bodies (chromatophores) as the ordinary green cells of the plant. However, in the variegated parts, the green color is not developed, and the chromatophores are often smaller or are somewhat swollen and vacuolate. In the case of chlorosis due to the lack of iron, or yellowing due to the lack of light, a leaf will quickly develop its normal color if given the proper conditions. This is not the case, however, in variegated leaves. While the intensity of whatever color the chromatophores may have can be varied by light and food, a variegated cell can never be changed by these means to a normal cell.

The chlorophyll granules (chromatophores) appear to have lost entirely, in many cases, the power to make starch and sugar from the carbonic acid gas in the air, and in other cases this power is very greatly reduced. In practically all cases, however, when the chromatophores are not destroyed, they retain the power to convert sugar into starch and they thus store up starch in their tissues from the sugar manufactured by the healthy cells of the leaf.

White or albino variegation is of course due to a lack of any coloring in the chromatophores, and sometimes to the entire absence of these bodies. The cells seem to have lost completely the power of making chlorophyll. These albicant variegations are to be looked upon as the more extreme forms of variegation, and usually arise through a feeble or atrophied condition of the plant. Seedlings raised from parents both of which are variegated in this way are usually very weak. High feeding and favorable conditions of growth, while they will not cause a variegated plant to return to its normal condition, will often stimulate the development of a normal green shoot that takes most of the nourishment and thus causes the starvation and disappearance of the albicant parts. In other cases, as in codieums, modified chlorophyll is made. Large yellowish oil-like drops occur in the substance of the chromatophores, and the various changes that these undergo, as the leaf becomes older, produce the remarkable and beautiful colorations of this group of plants. The coloration here, as in dracenas and caladiums, is intensified by strong light and nourishing food. The more of the modified chlorophyll there is produced and the more rapid the changes in the modified chlorophyll brought about through the action of light and the acids and oxidizing ferments of the leaves, the more highly developed will be the colors, though here again high feeding is likely to cause the plant to revert to its normal condition.

Variegated plants or parts of plants are usually of slower growth and smaller than green plants of the same variety or the green parts of the same plant.

Variegation occurs either by bud-variation or by variations in seedlings. In the former, a variegated branch is likely to appear on an otherwise perfectly normal plant. Such variegations are easily reproduced by budding, grafting, or cuttings, but generally do not develop again from seeds produced on such branches. On the other hand, when variegation develops in seedlings, the seeds of such plants usually give a number of variegated individuals, even the cotyledons being sometimes affected. In some cases the proportion of variegated plants from seeds is very large and can be increased by selection. As a rule, the form of

3906. Variegation in abutilon.

spotting or marking is not constant in seedlings, often being very different from the parent. In certain groups of plants, which have for many years been selected on account of the horticultural value of these markings, the variegated condition has become almost a fixed feature of the plant, as in dracenas, caladiums, and codieums. While the plants of these genera are not usually propagated from seeds, still when they are so propagated, a large number of seedlings show more or less variegation.

Darwin and many of the earlier investigators believed that these variations were started in the plant by unfavorable nutritive conditions, and much has been written on the subject as to whether or not variegations should be considered as diseased conditions.

The question as to whether a variegated condition could be transmitted to normal plants by budding and grafting has also been much disputed, but the weight of evidence indicates that in many cases such transmission certainly takes place. This has been thought to indicate the presence of some micro-organism, living either parasitically or symbiotically in the plant, and causing the changes known as variegation.

Investigations conducted by the writer on the so-called mosaic disease of tobacco, which is a form of variegation, and also on many other forms of ordinary variegation, show quite conclusively that the disease is not caused by micro-organisms, but is due to a deranged condition of the nutrition of the cells. Without going into the details of the matter, it may be said that the condition is characterized physiologically by a marked increase in the oxidation processes in the cells, caused by the presence of an abnormal amount, or an abnormal activity, of oxidizing ferment in the protoplasm.

These changes must, in most cases, therefore, be considered as pathological in their nature, as the vitality and vigor of the plants are reduced as a result. It is further evident that the initial causes of variegation may be quite diverse, some of the most usual being seed of low vitality; unsuitable nourishment, especially a lack of elaborated nitrogen; rapid growth in very moist soil; severe injury to the roots during a period of rapid growth of the upper parts of the plant; severe cutting back, and the like.

Though started at first through the influence of environment, variegation, when of value horticulturally, has in many cases been increased and fixed by selection till it has become almost a specific charac-

ter in some groups of plants, and is considered in the botanical description of them.

A word might be said in this connection regarding autumn coloration.

The production of color in autumn foliage is, as is well known, due in part to the gradual destruction of the chlorophyl when the leaves have reached maturity and approach the period of death, and in part to the action of acids on anthocyanin. Many of the destructive changes which take place in the chlorophyl are oxidation processes, the same as occur in the cells of highly colored variegated plants, and physiologically they are not very different from the changes occurring in calathea, caladium, codieum, and the like. The approach of maturity in the leaf, and the coming on of cool weather in autumn, stimulates the production of oxidizing ferments, and the action of these and the acids of the cell-sap on the chromogen, or color contents of the leaves, especially the chlorophyl and anthocyanin, causes many of the brilliant colors of autumn foliage (p. 431).

VEGETABLE-GARDENING. In horticultural usage a vegetable is an edible herbaceous plant or part thereof that is commonly used for culinary purposes. The product may or may not be directly associated, in its development, with the flower: the root, stem, leaf, flower-bud, partially developed seed-receptacle, mature seed-receptacle, or seeds (either immature or mature), may constitute the edible part. Some vegetables are edible only after being cooked, others (such as cabbage), are eaten either cooked or raw, while others, as melons, are used only in the fresh state, and are really dessert articles. In some countries, melons and tomatoes are regarded as fruits, though American usage classifies them as vegetables. Although it is difficult to make a general definition that will include all vegetables and exclude none, the use of the term "vegetable" is so well understood that there is little difficulty in making proper application of it in common speech.

All the art and science that has to do with the growing of the plants commonly called vegetables is popularly known as vegetable-gardening. The Latin term, olericulture, is sometimes used in formal writings as a synonym of vegetable-gardening, but has never become popular. Vegetable-gardening is usually considered as a branch of horticulture,

3907. Kinds of variegation. *Sansevieria* above and *caladium* below.

coordinate with pomology (fruit-growing) and floriculture. However, certain vegetables, such as potatoes, when grown in large areas in rotation with general farm crops, are sometimes looked on as agricultural rather than horticultural subjects.

Some of the crops may be classified as horticultural or agricultural depending on the uses for which they are to be employed. For example, beans that are grown for the green pods are horticultural subjects, but if the same varieties were to be grown for the mature seed for selling in the general market, they may be known as agricultural products. In like manner turnips may be horticultural subjects when grown in small areas for home or table use, but agricultural subjects when grown on large areas for stock-feeding.

Vegetable-gardening may be divided into two great categories, depending on the disposition that is to be made of the products; namely, commercial gardening (see page 1997, Vol. IV, the article *Market-Gardening*), of which the purpose is to make money from the industry; and home- or amateur-gardening, in which the purpose is to raise a supply for family use. Commercial vegetable-gardening may be divided further into four fairly well-defined types: market-gardening proper, truck-gardening or truck-farming, forcing (see Vol. III, page 1254), and the growing of vegetables for canning or pickling factories.

Market-gardening proper involves intensive methods of culture, and is most highly developed near large cities. Truck-farming involves the growing of one or a few special vegetable crops, often as an adjunct to a system of general farming. These are usually grown in relatively large areas, and at considerable distance from market. Questions of climate, soil, and shipping facilities largely determine the location of truck-gardening areas. The South produces early vegetables for northern markets; the North produces cool-climate crops for winter storage, such as onions, cabbage, turnips. Sweet corn, tomatoes, and peas for canning purposes, and cucumbers for pickling, are grown where the soil and climate are especially adapted to their culture.

Particular regions have become famous for the production of certain vegetable crops. Some examples are: Eastern Long Island for late cauliflower; Kalamazoo, Michigan, for celery; Rocky Ford, Colorado, and the Imperial Valley, California, for muskmelons; certain areas in Georgia for watermelons; southern Texas for the Bermuda type of onion; Norfolk, Virginia, for spinach, kale, and early potatoes; Ontario for turnips and other root-crops. Long-distance transportation has revolutionized vegetable-gardening in this country (see *Packing, Transportation*), and crops which were formerly grown only near market and had a limited season are now shipped across the continent, and may be procured in the same market, from some source, twelve months in the year. Head lettuce is an example.

The practices.

While in commercial vegetable-gardening the location is determined to considerable extent by soil and climate, in the home-garden the climate and the soil are largely beyond the choice of the gardener, since these matters are determined by the location of the homestead. The general effort in the home-garden is to secure products of high quality and to have a more or less continuous supply throughout the season. In market-gardening emphasis is usually placed on a few crops, whereas in home-gardening it is placed on a great variety of crops.

The old-time home vegetable-garden or "kitchen-garden" was generally unsuited to the easy handling of the soil and to the efficient growing of the plants. Ordinarily it was a small confined area in which horse-tools could not be used (Vol. III, page 1738). The rows were short and close together, so that finger-work was neces-

sary. The custom arose of growing crops in small raised beds, probably because such beds are earlier in the spring than those that are level with the ground. With the evolution of modern tillage tools, however, it is now advised that even in the home-garden finger-work be dispensed with as much as possible. Some of the very earliest crops may be grown in raised beds to advantage, but in general it is better to secure earliness by means of glass covers or by ameliorating the entire soil by under-drainage and the incorporation of humus and by judicious tillage. See *Tillage and Machinery*. In the home-garden on the farm particularly it is desirable that the rows be long and far enough apart to allow of tillage with horse-tools.

Vegetable-gardeners are usually large users of stable-manure. Near the large cities the manure is bought in carload lots or hauled with four-horse teams, and it is used every year or even two or three times a year. The reason for this frequent and heavy use of manure is the necessity of improving the physical texture of the land so that it will be loose, open, and mellow, be early or "quick," and hold an abundant supply of moisture. In intensive vegetable-gardening there is no "resting" of the land and no green crops to be plowed under. The vegetable matter, therefore, has to be supplied almost entirely by barn-manures. In the larger and less intensive vegetable-growing farther removed from large cities, general agricultural practices can be employed to better advantage, such as rotation and green-manuring. Vegetable-gardeners, especially in the East and South, generally use largely, also, of concentrated fertilizers.

In intensive vegetable-gardening it is important to start many of the crops under glass and to transplant the young plants to the open as soon as settled weather comes. See *Transplanting*. This is particularly true of tomatoes, very early lettuce, sweet potatoes, egg-plants, peppers, and the early crops of celery, cabbage, and cauliflower. In the northern states muskmelons and sometimes watermelons and cucumbers are started under glass, being grown in pots, veneer "dirt bands," or upon inverted sods, whereby they are transferred to the open without disturbing the roots. Formerly the plants were started under hotbed or coldframe structures, but of late years there has been a great increase in the extent of glass-houses or forcing-houses. These are primarily for the purpose of growing certain crops to maturity outside of their normal season in the given locality, but are often used a part of the season for starting plants intended for transplanting. In these structures conditions can be controlled better than in hotbeds, and they are especially valuable for the starting of very early plants in cold weather. However, hotbeds and coldframes are still exceedingly important adjuncts to the vegetable-garden. They are almost indispensable for the reception of early plants that have been started in a greenhouse and require "hardening-off" before transplanting into the open ground. They can be moved when the person shifts to other land, and the space that they occupy can be utilized for outdoor crops later in the season. They are extensively used for starting early plants. Much vegetable-gardening in large cities is prosecuted on rented lands; therefore it may not be profitable to invest in such permanent structures as forcing-houses. The first cost of hotbeds and coldframes is less than that of forcing-houses, and this is often a very important item. For management of glass structures, see *Hotbeds, Greenhouse, Forcing*.

The seed and variety problem is most complex. A mistake in the selection of a strain or kind may mean inability to meet a market demand either as regards characteristics or season. A round cabbage crowds out a pointed form. As soon as they mature, better varieties crowd out the Earliana tomato. Therefore the gardener must know varieties. Many seedsmen are making sincere efforts to provide good seed, and each

CXV. A market-garden of the modern type near a city; overhead irrigation.

year sees progress. Much remains to be accomplished in study and classification of varieties and types, and in the improvements of methods of seed-breeding and production. These problems are especially difficult because the crops are chiefly annuals, and changes take place with great rapidity. Experiment stations are now taking up this work on a sound scientific basis, a thing that could hardly be said of most early taxonomic studies. They are enjoying the coöperation of seed houses.

There are great numbers of insect and fungous pests that attack the vegetable-garden crops. See article on *Diseases and Insects*. The spray-pump has now come to be a necessary adjunct to any efficient vegetable-garden. However, there are many difficulties beyond the reach of the spray, particularly those that persist year by year in the soil or which attack the roots rather than the tops. For such difficulties, the best treatment is to give rotation so far as possible and to avoid carrying diseased vines back on the land the next year in the manure. Even the club-root of cabbage can be starved out in a few years if cabbages or related plants are not grown on the area.

In its best development vegetable-gardening is essentially an intensive cultivation of the land. Often it is conducted on property that is too high-priced for ordinary farming. Land that demands rent on a valuation of \$1,000 an acre is often used for vegetable-gardens; and higher-priced land, held for other uses later, may be used temporarily. There is also intense competition near the large cities. These circumstances force the gardener to utilize his land to the utmost. Therefore, he must keep the land under crop every day in the year when it is possible for plants to live or grow. This results in various systems of succession-cropping and companion-cropping, whereby two or more crops are grown on the land the same season or even at the same time. (For examples of companion-cropping, see *Market-Gardening*.) Market-gardening is usually a business that demands enterprise, close attention to details, and much physical labor. If, with his knowledge of vegetable-growing, the gardener combines good business and executive ability, and an intimate knowledge of market conditions, he should be able, however, to make it a profitable and attractive business. Although the outlay is likely to be large, the returns are direct and quick.

Extent and growth of the industry.

The most recent published statistics of vegetable-gardening in the United States are those of the Thirteenth Census, 1910. According to the report of this census, based on the crop of 1909, the acreage devoted to vegetable production in the United States was 7,073,379 acres, including 3,668,855 acres of potatoes. The total value of all vegetables reported for that year was \$418,110,154. Of the total number of farms in the United States, 4,969,540, or 78.1 per cent reported having farm-gardens; 4,261,776 gave the acreage devoted to vegetables and the value of the product. 41,731 farms reporting vegetables to a value of over \$500 each, and 4,220,045 farms less than \$500 each. "Farms of the former group usually produce vegetables chiefly for sale and make them an important part of their business, while on a large proportion of the other farms vegetables are raised only for home consumption." In 1909, the value of the vegetable crop (including potatoes) in the following states amounted to over 10 per cent of the total value of all crops in the respective states: Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Michigan, Delaware, Maryland, Virginia, West Virginia, Florida, Colorado, Nevada.

According to the figures, the production of vegetables between 1899 and 1909 increased from \$237,000,000 to about \$418,000,000. This includes the potato,

which is grown partly as a farm crop and partly as a vegetable-garden crop. With this most important commodity omitted, the corresponding figures for the miscellaneous vegetables are \$139,000,000 and \$251,000,000. The increase in the production of all other horticultural products, including fruit, flowers, nursery products and nuts, is from \$152,000,000 to \$273,000,000.

A map showing centers of vegetable production in the United States would show changes no less marked. New districts have been established almost without number in all sections of the country. The business is much more evenly distributed throughout the United States than formerly, and the states that have been regarded as great trucking states are no longer holding their preëminence without question. Thus, Illinois and Indiana have become great vegetable states, with the market-gardening for Chicago, trucking in southern Illinois for both Chicago and St. Louis, muckland trucking in the swamplands (see *Muckland-Gardening*, Vol. IV), and production of crops for the cannery. Similar statements might be made of other states. Ten years ago, truck-farming was thought of principally as production of vegetables in the South for shipment North. The advance in the importance of vegetables in the dietary, together with the rapid growth of the more southerly cities, has brought about a marked development in the production of vegetables in northern parts for shipment southward, particularly the cool-season crops for consumption when the gardens of the warmer climates are practically unemployed on account of the heat. The production of cabbage and potatoes in the North for shipment southward has long been a great industry, but of recent years important centers in the growing of cucumbers, peas, beans, and of the muckland crops, celery, lettuce, and onions, have been developed. Improved transportation facilities have made California an important source of supply for eastern markets.

The canning industry as connected with vegetable-gardening has been an important factor in making possible a continuous supply of vegetables throughout the year, and this industry has recently made much progress. Three phases of this industry utilize vegetable-garden crops—factory, farm, and home canning. Factory canning uses the products from a comparatively large acreage of crops on the truck-gardening or general farming scale. Corn, tomatoes, peas, and string beans are extensively handled by canning factories. Farm canning promises to be a means whereby the market-gardener or truck-farmer may turn his crops into greater profit when markets are glutted. Home canning is a means of preserving a supply of perishable vegetable products from one's kitchen-garden for home use.

The insistence of the population on a supply of vegetables through all the months has made possible the construction of greenhouse ranges, many of which are now measured in acres. The crops are lettuce, cucumbers, tomatoes, and radishes in the order named. While the business is not so satisfactory in the autumn months, because of poor growth conditions and on account of light demand, the returns after the first of the year are sufficient to render the business profitable and to justify increases in the areas under glass.

Market-gardening has kept pace with the growth of the cities, although some of the famous centers are declining on account of the great increase in real-estate values. The auto truck is an important factor in making it possible for the gardener to take advantage of the lower interest charges incident to the use of more distant lands.

In the practice of vegetable production, the most conspicuous development has been the introduction of overhead irrigation. Hundreds of acres are now watered in this way. The value of this practice is evident when it is considered that moisture is more often than otherwise the factor which prevents the gardener from rearing

ing returns from improvements which are far more costly than in other lines of agriculture.

The past ten years has seen the beginning of organization among vegetable producers. Coöperative selling is becoming a larger factor in the selling of produce on distant markets, and garden districts not yet ready for coöperative selling are finding material advantage in unified action in matters of the gathering of information as to their methods, in the purchase of supplies, the standardization of packages, the improvement of local market conditions, and of transportation facilities, in overseeing legislation and securing assistance through investigational agencies in the solution of local problems. The Vegetable Growers' Association of America was organized in 1908 and has brought into contact with one another a large group of men from all sections of the country. The New York State Vegetable Growers' Association, formed in 1911, has been the pioneer in state organization. All of these societies, national, state, and local, are finding new fields of usefulness and are each year serving directly an increased proportion of the men in the business, while all find advantage through their promotion of the general welfare.

Education; literature.

For many years a course in vegetable-gardening has been included in the curricula of most of the agricultural colleges of the United States and Canada, and more or less attention has been given to research in vegetable-gardening problems on the part of agricultural experiment stations. However, until within the last few years, both the teaching and research in reference to this subject were in most institutions conducted as incidental matters by some member of the staff whose principal energies were demanded by other horticultural interests. At the present time much more attention than formerly is being given the subject of vegetable-gardening in educational institutions, and many of the agricultural colleges and stations now have one or more men devoting their entire time to vegetable interests. In some of the institutions several courses are offered in vegetable work, including an introductory course, an advanced course in market-gardening, and courses in vegetable-forcing, systematic vegetable crops, and undergraduate research. Provision is also made for graduate work in problems bearing on vegetable-gardening.

Vegetable-gardening is also found to be especially adapted for use as a basis for giving instruction in the fundamental principles of crop production in schools, especially in those having only a limited area of land available for "laboratory" purposes. The simple equipment involved, the possibility of using odd bits of ground, the relatively short time in which results can be expected, and the high value of the product to be derived from a small area, together with its easy adaptation to educational purposes, all render this phase of agriculture especially serviceable in such activities. The work is conducted on special plots laid out for that purpose, and on the home farms and back yards.

There is a large literature devoted to vegetable-gardening, although much of it applies chiefly to amateur or home growing. Leading current books on the general subject of vegetable-gardening are those by Greiner, Green, Henderson, Rawson, Landreth, Bailey, Watts, Lloyd, and Corbett. For California one should consult Wickson's "California Vegetables in Garden and Field," and for the Atlantic South, Rolfs' "Vegetable-Growing in the South for Northern Markets," Oemler's "Truck-Farming at the South," and Rolfs' "Subtropical Vegetable-Gardening." There are many books devoted to special topics, and there are many others which in their time were of great practical value, but which are now chiefly known as recording the history of the epoch in which they were written. Only one American

work has been devoted to descriptions of varieties of vegetables, as the works of Downing, Thomas, and others have to varieties of fruits. This work is Fearing Burr's "Field and Garden Vegetables of America," Boston, 1863, and the abridgment of it in 1866, called "Garden Vegetables and How to Cultivate Them." A list of the American vegetable-gardening literature to that date may be found in Bailey's "Principles of Vegetable-Gardening" (1901). See also *Horticulture, Literature of*, Vol. III. Persons who desire a cyclopedic account of vegetables should consult Vilmorin's "Les Plantes Potagères," an English translation of the first edition of which is published in London as "The Vegetable Garden." Odd and little-known vegetables are treated in Paillieux & Bois, "Le Potager d'un Curieux," Paris, 3d ed. 1899.

JOHN W. LLOYD.

PAUL WORK.

Vegetable-growing in California.

It is an interesting fact that although California's horticultural prominence now rests on fruit products, the first attraction to the new state, after the gold discovery, was the wonderful growth of garden vegetables. The reports of immense size, of acreage product and of prices secured, were almost incredible because so much in advance of ordinary standards, but the statements were so fully authenticated that many were drawn to California by them. These horticultural pioneers, however, soon found that immigrants from Asia and the Mediterranean region, by their cheap living and by doing their own work, could cut under American growers who had to employ high-priced labor, and so the latter retired from the field, leaving the opportunity to the frugal and thrifty foreigner. Thus vegetable-growing, from an American point of view, came into disrepute and largely retains such disadvantage at present. The result is that the American largely avoids market-gardening, while Asiatics and South Europeans are thriving on it. There has been a reflection of the same disfavor in the farm growing of vegetables for home use, and our farming population, including the fruit-growers who should know and do better, is largely dependent on alien vegetable peddlers or products of canneries instead of fresh home-grown esculents, which would be cheaper and inexpressibly better than canned or transported supplies.

Fortunately there arose about twenty-five years ago a large industry in growing vegetables for overland shipment and for canning which clothed the plant-cultures involved in this trade with a new dignity and importance attractive to American growers. Cabbage, cauliflower, and celery for eastern shipment, asparagus for canning and for shipment, tomatoes for canning, and the like, have all become large special crops, while some other plants, like lima beans, which are chiefly grown in gardens elsewhere, have become field crops in California covering very large acreage. Such enterprises have enlisted American citizens and changed the popular conception of the dignity and opportunity of vegetable-growing. A measure of this influence, as well as of the extent of the product, may be had in the average annual shipments of green vegetables beyond state lines for several years ending with 1914:

Vegetables	Carloads
Artichokes (Globe).....	150
Asparagus.....	350
Celery.....	2,500
Cauliflower.....	1,000
Cabbage.....	1,000
Potatoes.....	10,000
Lettuce.....	300
Tomatoes.....	2,000
Mixed vegetables.....	1,000

The canned-vegetable output of 1914 was 2,373,182 cases (each containing twenty-four 2½-pound tins)

divided as follows: asparagus, 800,380; string beans, 81,905; peas, 188,667; tomatoes, 1,183,705; other vegetables, 119,525.

In addition to the foregoing there is the dry-bean product, which reached a total of 3,670,000 bags of 80 pounds each in 1915, and of sugar beets which was 203,-200 tons in 1915.

California conditions affecting vegetable-growing are wide and various. Nowhere else perhaps is it more essential that certain things should be done just at the right time and in the right way. If these requirements are fairly met the product is large and fine; if they are neglected the failure is sharp and complete. This fact has given rise to the impression that California is a hard place to grow vegetables, which is not true unless one lacks local knowledge or the nerve to apply it. One of the chief causes of failure is in following seasons and methods which have yielded success under conditions prevailing in the states east of the Sierra Nevada Mountains. If one begins garden-making in the springtime the plants do not secure deep rooting, which is necessary to carry them to success in the dry season, and the garden is likely to be a disappointment. If, on the other hand, all the hardier vegetables are sown in succession from September until February or March, there will be continuous produce through the winter and into the early summer. The chief shipments of vegetables from California are made during the late fall and winter and are taken right from the ground to the cars without protection or storage. Tender vegetables, like corn, beans, tomatoes, and the like, however, can be grown in the winter only in a few frostless places. They must either be pushed to a finish in the fall or sown early in the spring and carried into the dry summer as far as necessary either by natural moist land or by irrigation. There are a few localities, however, where tomatoes will fruit early in the spring from fall plantings, and peppers will live through the winter and bear a second season's crop on the old plants.

The possession of an irrigation supply is the secret of full satisfaction in California vegetable-growing, but a small amount of water, if skilfully applied, will work wonders. Irrigation will enable one to have something crisp and delicious in the garden every day in the year in the California valleys. It is true, however, that much can be done without irrigation by beginning at the opening of the rainy season in September, growing the hardier vegetables while moisture is ample even on the drier lands during the late fall and winter, and keeping the lower lands well plowed and cultivated to prevent evaporation until the tender vegetables can be trusted in the open air, and continuing cultivation assiduously afterward so that moisture can be conserved in the soil as long as possible for them. That this is thoroughly practicable is seen in the fact that the large lima-bean product is grown almost entirely without irrigation from plantings made as late as May and the whole growth of the plant is achieved without a drop of water except that stored in the soil. The same is true of the corn crop; perfect corn can be grown without a drop of rain or irrigation from planting to husking. In such cases, however, the winter rains are retained in the soil by cultivation. If winter growth is made by rainfall, summer growth can be had on the same land by irrigation. In this way irrigation becomes eminently desirable in securing all-the-year growth, which cannot be had by rainfall. With good soil and abundant irrigation it is possible to secure four garden crops in rotation within the year—the hardy plants in the fall and winter months; the tender plants in the spring and summer. Of course the adjustment of all these means to desired ends requires good perception and prompt action, and explains why those who have been accustomed to plant at a fixed date and do little but cut weeds afterward may find it hard to secure the best results in California. And yet the Californian grower has great advantages

in his deep rich soil, in freedom from many diseases (which thrive in a humid atmosphere) and in an exceedingly long growing season.

Local adaptations for different vegetables are sometimes quite sharply drawn and selection of lands for large specialty crops must be made with reference to them. The result is that the earliest vegetables come from practically frostless places in the Colorado River region of southeast California; almost all the lima beans are grown on a coast plain from Santa Barbara southward; the celery for eastern shipment is nearly all grown on the peat lands of Orange and San Joaquin counties; the cabbage comes largely from San Mateo County; asparagus and tomatoes from Alameda County and river islands of Sacramento and San Joaquin counties, and so on. Smaller areas of these products and others not mentioned are more widely scattered, but everywhere the local soil, exposure, and climate are chief considerations.

There is prospect of great increase in all the vegetable products of California. Fresh and dried vegetables enter largely into ocean traffic with distant Pacific ports. Interstate trade is constantly increasing and canned vegetables are contracted in advance to European distributors as well as to dealers in all the Americas.

VEITCHIA (James Veitch, of Chelsea, famous English nurseryman). *Palmaceæ*. About 4 species of pinnate palms native to the Fiji Is. and New Hebrides. The genus belongs to that section of the *Areca* tribe characterized by a parietal ovule which is more or less pendulous and fls. spirally disposed in the branches of the spadix, and is distinguished from *Hedyoscepe* and allied genera by the following characters: sepals of the male fls. chartaceous, connate at base; female fls. much larger than the males. It is doubtful whether any species is now in the trade. *V. Joannis*, H. Wendl., was cult. early in 1880-90. Lf.-segms. with a wide and rather shallow notch at the apex or obliquely truncate; sheath, petiole and rachis a dark blood-color and covered when young with a gray tomentum interspersed with lanceolate, thin, dark red scales: fr. $2\frac{1}{2} \times 1\frac{1}{4}$ in., ovoid-ellipsoid, orange, with a red base. G.C. II. 20:205. R.H. 1883, p. 344. Has been cult. in S. Calif. but is tender there. It has been conjectured that *Kentia Van Houttei* advertised in 1895 by American dealers may be a species of *Veitchia*. The genus is imperfectly known and of minor importance horticulturally.

VELLOZIA (Velloz, a Portuguese naturalist). *Velloziaceæ*; or *Amaryllidaceæ*. Usually shrubs, sometimes arborescent, adapted to the warmhouse. Sts. fibrous-woody, usually dichotomously branched: lvs. linear, rigid, tufted at the ends of the branches: peduncles 1-flid.: fls. usually white; perianth funnel-shaped; segms. subequal, ovate-lanceolate; stamens 6, sometimes many; ovary clavate, 3-celled; ovules many, superposed: caps. coriaceous, dehiscing at the apex.—About 65 species, Trop. and S. Afr., Madagascar and Brazil. *Vellozia* is closely related to *Barbacenia* but distinguished by having more than 6 stamens, whereas *Barbacenia* has only 6. *V. trichophylla*, Hemsl. (*V. equisetoides*, W. Wats., not Baker. *V. equisetoides* var. *trichophylla*, Baker). Shrub having a thick caudex, 1 ft. or more diam. and short thick primary branches: lvs. numerous, grass-like, scarcely stiff, 3-9 in. long in cult. specimens (often 1-2 ft. long and more rigid in wild specimens), about $\frac{1}{2}$ in. wide: peduncles usually in 3's, 1-flid.: fls. reddish lilac, very fragrant; perianth-segms. lanceolate, acute, 1-1½ in. long. E. Trop. Afr. B.M. 7962. G.C. III. 34:425. Very little known in cult.

VELTHEIMIA (named for the Count of Veltheim, 1741-1801). *Liliaceae*. Greenhouse and half-hardy tunicate bulbous perennials; spring and summer.

Leaves radical, several, oblong or strap-shaped, rather thick, herbaceous, lower longer than the upper, sheathing the base of the simple leafless scape: fls. showy, pendulous, densely grouped in a terminal raceme or spike; perianth tubular, cylindrical, persistent, lobes 6, very short, tooth-like; stamens 6; ovary sessile or subsessile, oblong, 3-celled: caps. membranous-scarious, the 3 angles strongly dilated and wing-like, loculicidally 3-valved.—Three species, S. Afr. They are easy of cult. and are but little known in Amer.

A. *Lvs. green, 2-3 in. broad.*

viridifolia, Jacq. *Lvs.* oblong-lorate, wavy-margined, finally 1 ft. long: scape mottled with purple: raceme very dense, 3-6 in. long, 25-30-fl.: fls. $1\frac{1}{4}$ - $1\frac{1}{2}$ in. long, yellow or reddish, with greenish tips. L.B.C.

3908. False hellebore.—*Veratrum viride*. Showing the handsome foliage of early spring when the leaves are about a foot high.

13:1245. B.M. 501 (as *Aetris capensis*). G.C. III. 49:164. Gn. W. 22:117. G.W. 5, pp. 112, 454.

AA. *Lvs. glaucous, 1½ in. broad.*

glauca, Jacq. *Lvs.* oblanceolate-lorate, acute, glaucous: scape less stout: fls. "yellow or bright red," according to Baker. B.M. 1091 (fls. white, dotted red toward the tips); 3456 (fls. reddish purple, dotted yellow above).

F. TRACY HUBBARD,†

VELVET BEAN: *Stizolobium*. V. Tree: *Gymna aurantiaca*.

VENIDIUM (name not explained by its author). *Compositae*. Annual or perennial herbs, grown for ornament.

Rays female: receptacle honeycombed, mostly nude: involucre scales in several rows, the outer narrower and herbaceous, inner scarious: achenes glabrous, dorsally 3-5-winged or -ridged, the lateral ridges inflexed, the medial straight, narrower; no hairs from the base of the achene: pappus either none or of 4 very minute, unilateral scales.—Eighteen species, S. Afr., 7 of which are annuals. By Hoffmann (Engler & Prantl, Pflanzenfamilien) united with *Aretotis*.

The following account of *V. calendulaceum* of the gardens as a garden plant is adapted from Gn. 21, page 405. It is a graceful single-flowered composite which

flourishes under the ordinary treatment accorded half-hardy annuals, making a compact rounded mass 2 feet high and 3 feet wide. "There is considerable diversity in its seedlings both as regards habit and the size, shape and shading of its blossoms, and careful selection in seed-saving is needful in order to secure the best forms. It is admirably adapted for cutting, as the flowers open and shut as regularly as when on the plant." This species has also been treated as a greenhouse perennial, continuing to bloom until near midwinter. The flower-heads are fully 2 inches across.

decurrens, Less. Diffuse caescent perennial, 1-2 ft. long: *lvs.* mostly lyrate, the terminal lobe ovate or roundish, sinuate-lobed or repand, at first cobwebbed, afterward nude and punctate above, white-tomentose beneath; petiole 2-2½ in. long, amply eared at base, the ear decurrent along the st.—The type does not seem to be cult. but the following variety is offered as a half-hardy garden annual with dark-centered sunflower-like golden yellow heads 1-2½ in. across:

Var. *calendulaceum*, Harvey (*V. calendulaceum*, Less.), differs in having the petioles not eared at the base or with only a small ear. R.H. 1857, p. 123. Gn. 21, p. 405. G. 5:345.—Opinions differ as to its merits, and it is variable in quality. Some consider it coarse and weedy. In pots it does well; for spring bloom, sow in Aug. to Oct. in a frame in light soil and prick off into pots; if well grown it is very free-flowering.

WILHELM MILLER.

VENUS' FLY-TRAP: *Dionaea muscipula*. V. Hair: *Adiantum Capillus-Veneris*. V. Looking-Glass: *Specularia Perfoliata*. V. or Venice Sumach: *Cotinus Coggynia*.

VERATRUM (ancient name of hellebore). *Liliaceae*. FALSE HELLEBORE. Hardy perennial herbs grown in the border.

Rhizome stout: sts. erect, stout, leafy base thickened but not truly bulbous: *lvs.* usually broad, plicate-veined, contracted to a broad sheath: fls. purplish, greenish, or whitish, numerous in a terminal panicle, polygamous; perianth persistent, broadly campanulate or explanate, segms. connate at the base especially in the female fls.; stamens 6; ovary ovoid, apex very shortly 3-lobed: caps. septically splitting into 3 carpels.—About 18 species, Eu., Asia, Russia, and N. Amer.

Veratrum is striking habit plants, of easy culture in moist shady positions. In the open sunlight or in dry ground the foliage is liable to burn and decay prematurely. They may be propagated by division or seeds.

A. Fls. whitish or greenish.

B. Perianth-segms. crisped-dentate.

album, Linn. EUROPEAN WHITE HELLEBORE. A hardy perennial 3-4 ft. high: root short, fleshy: *lvs.* green, plicate; radical *lvs.* 1 ft. long, oblong, 5-6 in. wide, firm in texture: panicle 1-2 ft. long, dense: fls. whitish inside, greenish outside; segms. oblong-spatulate, crisped-dentate; pedicels almost none. June, July. Eu., N. Asia.

BB. Perianth-segms. serrulate or entire.

viride, Linn. AMERICAN WHITE HELLEBORE. INDIAN POKE. Fig. 3908. A hardy perennial, 2-7 ft. high: rootstock 2-3 in. long: *lvs.* plicate, acute, the lower oval, about 1 ft. long, the upper gradually smaller: fls. yellowish green; segms. obovate or oblanceolate, ciliate, serrulate; pedicels 1-3 lines long. July. N. Amer.

B.B. 1:408. B.M. 1096 (as *Helonias viride*). Gn. 62, p. 283.

californicum, Durand. St. very stout, 3-7 ft. high: lvs. ovate-acute, the upper ones lanceolate but rarely acuminate: perianth-segms. broader than in *V. viride*, obtuse, whitish with a greener base. Colo. and Wyo. to N. Calif. and Ore. G.C. III. 46:395. Gn. 62, p. 411.—Intro. 1883. The long panicle of whitish, bell-shaped, drooping fls. is followed by ornamental frs. or caps.

AA. Fls. blackish purple.

nigrum, Linn. A hardy perennial often 2-4 ft. high, somewhat bulbous at the base: lower lvs. oblong, plicate, 1 ft. long, 6-8 in. wide, narrowed at the base; upper lvs. lanceolate: panicle narrow: fls. blackish purple; segms. oblong, obtuse. June. Eu., Asia. B.M. 963. G.W. 2, p. 99; 14, p. 618. F. TRACY HUBBARD.†

VERBASCUM (old Latin name of the mullein used by Pliny). *Scrophulariaceae*. MULLEIN. Hardy biennial herbs, rarely perennial or shrubs, more or less tomentose or floccose-lanate, sometimes grown in the garden or border for ornament.

Plants usually erect and tall: lvs. all alternate, usually soft, entire, crenulate, sinuate-dentate or pinatifid: racemes or spikes terminal, simple or branched: fls. yellow, fuscous, purple or red, rarely white; calyx deeply 5-cleft or parted, rarely shortly 5-toothed; corolla-tube about none, explanate-rotate, lobes 5, broad, slightly unequal; stamens 5: caps. globose, oblong or ovoid, septicidally 2-valved.—About 270 species, natives mostly of the Medit. region, widely intro. in other countries. Prop. by means of cuttings or division, although most of the mulleins usually self-sow freely.

The mulleins are very easily cultivated, adapting themselves to almost any soil except a wet cold one. In America the name mullein calls to mind the common weed, *V. Thapsus*, but this same weed if massed in the wild border is a very showy plant and gives a tall columnar effect which is very pleasing when contrasting with looser, more open-growing plants such as larkspur, wild asters, and goldenrods. Another feature of the mulleins which makes them valuable in border planting is the generally predominating gray-green of the foliage, in fact of the whole plant, which contrasts with the bright or dark green foliage about it. The most serious drawback to the mulleins in general is that most of them are biennial and although they reproduce naturally and freely they hybridize so readily that they rarely reproduce true. However, most of the hybrids are as showy as their parents and as a whole they deserve a place in every border of size. Some of the more showy and satisfactory species are *V. olympicum*, *V. phæniceum*, *V. Chaixii*, *V. nigrum*, *V. phlomoides*, *V. pannosum*, and *V. cupreum*, although many others are almost equally as good. In choosing varieties the question of height should be taken into account, as some species grow much taller than others. Nearly all the species will stand any amount of sun although some of them, as *V. phæniceum*, do better in partial shade as the flowers do not open well in strong sunlight.

KEY TO THE SPECIES.

- A. Anthers of the lower and longer stamens adnate-decurrent. (Section 1. *Thapsus*.)
B. Fls. clustered. (Subsection 1. *Euthapsi*.)
C. Anthers very short-decurrent: corolla concave at the throat. . . . 1. *Thapsus*
CC. Anthers longer adnate-decurrent: corolla flattened out.
D. The fls. subsessile.
E. Cauline lvs. long-decurrent. . . 2. *thapsiforme*
EE. Cauline lvs. short-decurrent. . . 3. *phlomoides*
DD. The fls. pedicelled, pedicels about as long as or longer than the calyx.
E. Lvs. 1½-2 ft. long. 4. *longifolium*
EE. Lvs. 6-8 in. long. 5. *crassifolium*
BB. Fls. solitary or nearly so.
C. Plants woolly. (Subsection 2. *Spectabiles*.)
D. Corolla yellow. 6. *ovalifolium*
DD. Corolla bluish or purplish. . . . 7. *Wiedemannianum*
CC. Plants glabrous or glandular-pilose above. (Subsection 3. *Blattaria*.)
D. Pedicels in 2's or 3's. 8. *virgatum*
DD. Pedicels solitary. 9. *Blattaria*
AA. Anthers all kidney-shaped and of about equal size. (Section II. *Lychnites*.)
B. Parts of the infl. as well as the rest of the plant woolly.
C. Pedicels shorter than the calyx or nearly wanting.
D. Infl. simple or few-branched. (Subsection 1. *Thapsoidea*.)
E. Fls. solitary. 10. *niveum*
EE. Fls. in clusters.
F. Filaments violet-bearded. . . 11. *Boerhaavii*
FF. Filaments yellowish or white-bearded.
G. Base of blade cordate-subauriculate. 12. *glomeratum*
GG. Base of blade attenuate. . . 13. *simplex*
DD. Infl. many-branched.
E. Fls. clustered; calyx deeply 5-parted. (Subsection 2. *Glomerata*.)
F. Filaments white-bearded. . . 14. *mucronatum*
FF. Filaments purple-bearded. . . 15. *sinuatum*
EE. Fls. solitary or in few-fl. clusters; calyx 5-toothed. (Subsection 3. *Pyramidata*.) 16. *pyramidatum*
CC. Pedicels as long as or longer than the calyx. (Subsection 4. *Lychnitidea*.)
D. Beards of the filaments purple (sometimes white in No. 19).
E. Infl. simple or nearly so. . . . 17. *nigrum*
EE. Infl. many-branched.
F. Corolla-lobes nearly rotund. 18. *Chaixii*
FF. Corolla-lobes obovate. . . . 19. *pyramidale*
DD. Beards of the filaments white (often purple in No. 19).
E. Upper surface of lf. glabrous. 20. *Lychnites*
EE. Upper as well as lower surface of lf. tomentose.
F. Margins of lvs. crenate. . . . 19. *pyramidale*
FF. Margins of lvs. entire or nearly so.
G. Lvs. oblong or elliptic, broader toward the middle. 21. *pulverulentum*
GG. Lvs. more or less lanceolate, broader toward the base.
H. Calyx-segms. lanceolate. 22. *songaricum*
HH. Calyx-segms. narrowly linear-lanceolate. 23. *olympicum*
BB. Parts of the infl. glabrous or nearly so, the rest of the plant woolly.
C. Corolla glabrous: fls. clustered. (Subsection 5. *Levantha*.) 24. *leianthum*

cc. *Corolla glandular: fls. solitary or in few-fl. clusters.* (Subsection 6. *Blattarioides*.)

D. *Segms. of calyx linear-lanceolate*.....25. *rubiginosum*

DD. *Segms. of calyx elliptical*.....26. *phoeniceum*

Section I. THAPSUS.

Subsection 1. EUTHAPSI.

1. *Thapsus*, Linn. (*V. Blattària*, J. A. Schmidt, not Linn. *V. giganteum*, Willk. *V. Schraderi*, Mey.). COMMON MULLEIN. Fig. 3909. Biennial, 2-6 ft. high,

3909. Rosette of mullein.—*Verbascum Thapsus*.

densely yellowish tomentose; radical lvs. oblong, crenulate, petioled; cauline lvs. decurrent from lf. to lf.: fls. yellow, fascicles forming spike; calyx tomentose, lobes lanceolate; corolla small, concave. Eu., especially N. and Cent., and Cent. Asia, also naturalized in N. Amer. Gn. 28, p. 148.—A familiar weed in woods and uncultivated fields. Hybridizes very readily with other species. There is also a white form of the species. This plant varies considerably in the color and size of its fls., the denseness of its infl., and probably occurs under several trade names in Eu. A first-year rosette in a pot makes an attractive plant (Fig. 3909).

2. *thapsifforme*, Schrad. (*V. densiflorum*, Bertol.). Biennial, about 2-5 ft. high, densely yellowish tomentose; radical lvs. oblong-elliptic or elliptic-lanceolate, crenulate, attenuate to the petiole; cauline lvs. narrowly decurrent from lf. to lf.: fls. in fascicles forming spike, large, yellow; calyx tomentose, segms. lanceolate; corolla rotate, rather flat. Eu. and Cent. Russia. Var. *macrurum*, Benth. (*V. macrurum*, Ten.), is white-tomentose and the cauline lvs. are more broadly decurrent. Italy.

3. *phlomoïdes*, Linn. Biennial, 4-6 ft. high, whitish- or yellowish tomentose; radical lvs. crenulate, elliptic or oblong-lanceolate, attenuate to the petiole; cauline lvs. amplexicaul, usually cordate or very shortly decurrent: fls. yellow, in very short fascicles forming a long raceme; calyx tomentose, segms. triangular-lanceolate; filaments white-woolly. S. E. Eu. and Caucasus. Gn. 40, p. 561; 41, p. 555. Var. *album*, Hort., has creamy white fls.—The species has become naturalized in E. N. Amer.

4. *longifolium*, Ten. Biennial, 3-4 ft. high, covered with white or yellowish flocculent tomentum: lvs. numerous, densely superposed; lower $1\frac{1}{2}$ -2 ft. long, narrowly ovate or oblong-lanceolate, acuminate, base narrowed to a short petiole; upper sessile, base amplexicaul, all undulate: infl. sessile, 1 ft. long, $3\frac{1}{2}$ in. diam., with innumerable short appressed branches: fls. golden yellow, about 1 in. across; calyx stellate-tomentose, segms. lanceolate. S. Eu. B.M. 7707. Var. *pannòsum*, Hort. (*V. pannòsum*, Vis. and Panc.), is more densely tomentose, the infl. is laxer and more branched and the fls. often larger. G. 31:105. Gn. 62, p. 165. Not a good variety botanically.

5. *crassifolium*, Hoffm. & Link. Biennial, about 3-4 ft. high, densely yellowish tomentose: lvs. obovate-spatulate, 6-8 in. long, crenulate; cauline long-decurrent: fls. fascicled in a spicate raceme, yellow; corolla flattened; filaments glabrous. Portugal.—Closely allied

to and possibly only a variety of *V. thapsifforme*. One of the few species said to thrive well in a light sandy soil.

Subsection 2. SPECTABILES.

6. *ovalifolium*, Don (*V. formòsum*, Fisch.). Biennial, about 2-3 ft. high, gray-tomentose: lvs. large, ovate, petioled, coarsely and rather double-crenate, cordate, petioled, hoary beneath; upper lvs. cordate-clasping: fls. sessile or nearly so, solitary, large, $1\frac{1}{2}$ in. across, bright yellow, in a spike; calyx densely white-tomentose, segms. broad-lanceolate; filaments orange- or purple-woolly. S. Russia. B.M. 1037. B.R. 558.

7. *Wiedemanniànium*, Fisch. & Mey. Biennial, 1-3 ft. high, appressed, arachnoid woolly: st. stout, tall, leafy below: lvs. lanuginose; radical oblong or elliptic, 3-5 in. long, crenate or rather entire, attenuate to the petiole; cauline diminutive, oblong, sessile: fls. solitary, in a simple raceme or slightly branched panicle, large, $1\frac{1}{4}$ in. across, indigo-blue to purplish lilac; calyx densely glandular-hirsute, segms. lanceolate-linear; filaments purple-bearded. Caucasus. G.C. III. 14:785. Gt. 43, p. 76.

Subsection 3. BLATTARIA.

8. *virgatum*, With. (*V. Blattària*, Vell., not Linn. *V. blattarioides*, Lam. *V. glabrum*, Willd. *V. viscidulum*, Pers.). Biennial, $1\frac{1}{2}$ - $3\frac{1}{2}$ ft. high, whole plant green, somewhat viscid-hispid or nearly glabrous: lvs. glabrous or glandular-hispid, especially beneath, oblong; lower petioled, dentate or sinuate-pinnatifid; upper sessile, cordate-clasping or shortly decurrent: raceme glandular-hispid; pedicels in 2's or 3's, rarely solitary: fls. yellow, throat violet; filaments violet-woolly. Cosmopolitan.

9. *Blattària*, Linn. MOTH MULLEIN. Biennial, 8 in. to 4 ft., glabrous and green: sts. usually tall: lvs. oblong or oblong-lanceolate, dentate; lower attenuate to the petiole, undivided or sinuate-pinnatifid; upper sessile, cordate-amplexicaul, acute: raceme very long and lax: fls. rather large, yellow, rarely white, borne on solitary pedicels; calyx glandular, segms. linear-lanceolate; corolla-throat violet; caps. globose, longer than the calyx. Eu., N. Asia.—Distinguished from *V. virgatum*, which it resembles, by the solitary pedicels.

Section II. LYCHNITIS.

Subsection 1. THAPSOIDEA.

10. *niveum*, Ten. Biennial, about 2 ft. high, possibly more, white-tomentose: lvs. ovate-oblong, crenate, undulate; lowest petioled, the others sessile, acuminate, rather spoon-like, shortly half-decurrent, the wings cuneate: raceme simple and very dense: fls. yellow, rarely white, solitary, subsessile; calyx-segms. ovate, acute; filaments white-woolly. S. Italy.

11. *Boerhaavii*, Linn. Biennial, about 2 ft. high, snow-white, tomentose-floccose, finally deciduous: st. reddish, leafy: lvs. crenate-dentate; lower ovate, obtuse, petioled; upper cordate-clasping, acute or acuminate: fls. in a long rigid spike-like raceme, yellow, in subsessile fascicles; calyx tomentose and glandular-viscid; segms. lanceolate; corolla violet-spotted at the throat; filaments violet-bearded. Medit. region.

12. *glomeratum*, Boiss. Biennial, 4-6 ft. high, densely grayish yellow, ragged, tall and stout: lower lvs. 1 ft. or more long, 3-4 in. broad, subentire, subsessile, oblong-lanceolate, base attenuate; upper lvs. ovate, acuminate from a cordate-subauriculate base: infl. thyrsoid-paniculate: fls. subsessile in 3-4-fl. glomerules, yellow; calyx-segms. lanceolate; corolla strongly tomentose outside; filaments yellowish bearded. Asia Minor.

13. *simplex*, Labill. Perennial, about 2 ft. high, many-stemmed, base shrubby, densely white or yellowish, ragged: st. leafy below then prolonged into a long (6-12 in.) simple, strongly interrupted, rarely

slightly branched raceme: radical lvs. 1-2 in. long, crenulate, ovate- or oblong-spatulate, very obtuse, long-petioled; cauline lvs. sessile or nearly so, arranged in remote glomerules of 2-5: fls. yellow; calyx white-tomentose, segms. oblong, mucronate; filaments white-bearded. Syria. G.C. III. 36:2.

Subsection 2. GLOMERATA.

14. *mucronatum*, Lam. Biennial, several feet high, densely white, ragged-tomentose: st. erect, crowded, leafy, large-panicled: lvs. thick; radical oblong, crenate, sometimes somewhat lobed and somewhat petioled; cauline lvs. oblong, rather long-decurrent; uppermost suborbiculate, mucronate: glomerules of fls. globose, forming a long virgate, interrupted raceme: fls. subsessile, white; calyx silky-lanate, segms. broad-lanceolate; filaments white-woolly. Asia Minor and Crete.

15. *sinuatum*, Linn. Biennial, 2-3 ft. high, more or less densely yellowish or gray-tomentose: radical lvs. oblong-spatulate, subsessile, sinuate-pinnatifid, usually undulate; upper cauline lvs. oblong, acute, entire and short-decurrent: panicle pyramidal; branches elongated, twig-like: fls. yellow, rarely white, in remote glomerules; calyx tomentellous, segms. short-lanceolate; corolla small; filaments purple-woolly. Medit. region and Canary Isls.

Subsection 3. PYRAMIDATA.

16. *pyramidatum*, Bieb. Biennial, 2-4 ft. high, tomentose: st. stout: lvs. green above, canescent beneath; radical lvs. large, oblong, base long-narrowed, doubly and obtusely lobed or crenate; upper lvs. sessile, ovate, auriculate-cordate, long-acuminate: panicle pyramidal, sometimes 2 ft. long, canescent; branches finally rather lax: fls. yellow, solitary or in pairs; calyx tomentose, segms. oblong or ovate; corolla large; filaments purple-woolly. Caucasus.

Subsection 4. LYCHNITIDEA.

17. *nigrum*, Linn. (*V. Hinkei*, Friv.). Biennial, 2-3 ft. high: st. tall, angled above: lvs. green above, more or less tomentose beneath; lower long-petioled, ovate or oblong, base cordate; uppermost sessile, base rotundate: infl. a simple or slightly branched elongated raceme: fls. small, yellow, in many-fld., lax fascicles; calyx auriculate, segms. lanceolate-subulate; corolla-throat purple; filaments violet-bearded. Eu. and Asia. Gn. 27, p. 173. Var. *album*, Hort., has white fls. G. 15:159. Gn. 41, p. 551.

18. *Chaixii*, Vill. Biennial, usually about 3 ft. high, whitish tomentose: st. somewhat angled above: lvs. ovate to oblong, green or tomentose below, crenate; lower 3-6 in. long, petioled, base cuneate, more or less crenate or rather incised; upper lvs. sessile, base rotundate: racemes paniculate, fascicled and laxly several-fld.: fls. yellow; calyx-segms. lanceolate-subulate; corolla-lobes nearly rotund, filaments purple-woolly. S. Eu. Gn. 27, p. 172; 78, p. 435. Var. *album*, Hort., is white-fld. form.—This species is said to reach a height of 10 ft. and to act like a true perennial in warm soils. 19. *orientale*, Bieb., is considered the same by some authorities; apparently not in cult. The vars. *semi-natum*, Hort., and *Freyianum*, Hort., are really hybrids.

19. *pyramidale*, Host. (*V. speciosum* × *V. orientale*). Biennial, 3-4 ft. high, white-pilose: lvs. rugose, crenate, acuminate, radical and lower cauline lvs. oblong, broad, upper smaller, strongly canescent: fls. small, collected in glomerules, yellow; calyx densely tomentose; corolla-lobes obovate, red-brown-maculate at base; filaments white or purplish hairy. Austria.—Neither of the parents are in cult. and it is questionable what the material in the trade under this name really is; possibly it is *V. pyramidatum*.

20. *Lychnitis*, Linn. Biennial, tomentose: lvs. crenate, green above, slightly hoary or canescent beneath; radical oblong-elliptic, narrowed to the petiole; upper lvs. sessile, lanceolate: infl. paniculate; branches erect-spreading, angled: fls. small, yellow or white; calyx tomentose, segms. lanceolate, acute, tips glabrous; filaments white-woolly. Eu. and Caucasus.

21. *pulverulentum*, Vill. Biennial, 3-9 ft. high, densely white-floccose-tomentose: lvs. entire or obsoletely crenate; radical lvs. oblong or elliptic, attenuate to a short petiole; upper lvs. ovate or rotundate, clasping: infl. a pyramidal panicle: fls. yellow, in slightly remote fascicles; calyx densely floccose, segms. linear-lanceolate; corolla small; filaments white-woolly. Eu. Gn. 73, p. 422.

22. *songaricum*, Schrenk. Biennial, several feet high, white-tomentose: lower lvs. lanceolate, acute, narrowed to the petiole; cauline sessile, oblong, cordate-auriculate; uppermost subrotund, cuspidate: racemes panicled: fls. in fascicles, yellow; calyx-segms. lanceolate; filaments white-bearded. Soongaria.

23. *olympicum*, Boiss. Biennial, 3-5 ft. or more high, densely white-tomentose: lower lvs. usually 6 in. long, oblong-lanceolate or lanceolate, entire, base attenuate; upper lvs. short-lanceolate, acute: panicles pyramidal, the racemes very long, lax; glomerules many-fld.: fls. rather large, about 1 in. across, bright yellow; calyx very tomentose, segms. long and narrowly linear-lanceolate; filaments white-bearded. Greece. G. 13: 669. Gn. 30, p. 213; 31, p. 125; 38, pp. 55, 66; 41, p. 555; 47, p. 147; 70, p. 91; 78, p. 436. Gag. 1:273. J.H. III. 52:119. Gt. 31:1078.

Subsection 5. LEIANTHA.

24. *leianthum*, Benth. Biennial, up to 14 ft. high, covered with a dense white felt: basal lvs. very large, sometimes 4 x 2 ft.; cauline lvs. oblong, crenate, rugose, base decurrent, lax, whitish tomentose on both surfaces: infl. much branched up to 7 x 3½ ft., laxly many-fld.: fls. bright yellow, ¾ in. across; calyx-segms. small, oblong-lanceolate, rather obtuse. Asia Minor. G.C. III. 44:171. Gn. 72, p. 509.

Subsection 6. BLATTARIOIDEA.

25. *rubiginosum*, Waldst. & Kit. Biennial, about 2-3 ft. high: st. glabrous or pubescent above: lvs. green, pubescent beneath, crenate; lower petioled; upper sessile or cordate-clasping: racemes laxly branched, somewhat paniculate; pedicels in 2's or 3's, rarely solitary, twice or many times as long as the calyx: fls. reddish purple; calyx-segms. linear-lanceolate; filaments purple-woolly. S. E. Eu. and Caucasus.—Boissier Flora Orientalis suggest that this is a hybrid between *V. phoeniceum* and *V. nigrum*. Var. *ferrugineum*, Benth. (*V. ferrugineum*, Mill.), has a long simple raceme and slightly larger and longer-pedicelled fls. than the type. Horticultural form, possibly a hybrid.

26. *phoeniceum*, Linn. (*V. ferrugineum*, And.). PURPLE MULLEIN. Biennial, about 5 ft. high: lvs. glabrous above, short-puberulent beneath; radical rosulate, ovate or oblong-rhomboid, attenuate to the short petiole, obtuse, obtusely crenate or repand; cauline lvs. few, sessile, oblong or lanceolate, acute: fls. purple or red, in a simple slender raceme; calyx glandular, obtuse segms. elliptical; corolla glabrous; filaments purple-woolly. S. E. Eu., Caucasus, and Persia. G. 15:158. Gn. 22, p. 377; 27, p. 173; 41, p. 566. A.G. 13:630. L.B.C. 7:637.—The name *phoeniceum* was undoubtedly suggested by the Phœnician purple and not by the habitat. One of the parents of nearly all the hybrids having fls. of purple, violet, rose, pink, and lilac shades. The fls. open poorly in sunshine, preferring damp weather, consequently the locality should be one where only the morning and evening sun strike the

fls. Var. *album*, Hort., is a white-fl. form. Gn. 46, p. 519.

V. Caledonia, Hort. (*V. hybridum caledonia*, Hort.), is a hybrid by some said to have buff fls., by others sulfur-yellow shaded bronze, and by still others rosy drab with a darker center, and by all to be strong-growing and branched.—*V. cupreum*, Sims (*V. phoeniceum* var. *cupreum*, Benth ex W. Mill. *V. ovalifolium* × *V. phoeniceum*). Biennial: st. simple: lvs. cordate-ovate, rugose, crenate, lanate beneath: raceme elongated; pedicels rather long, 1-bracted: fls. copper-colored. Garden hybrid. B.M. 1226.—It differs from *V. ovalifolium* not only in the color of the fls., but also in having pedicelled instead of sessile fls., and 1 subtending bract instead of 3.—*V. Libani*, Hort., is offered in the trade.—*V. newyense*, Hort. (*V. Chaixii* × *V. phlomoides*), is offered in the trade as having erect spikes of large yellow fls. with dark centers.

F. TRACY HUBBARD.

VERBENA (ancient Latin name of the common European vervain, *V. officinalis*). *Verbenaceæ*. Annual or perennial herbs or subshrubs, which are diffuse or sometimes creeping, some of them common flower-garden plants and sometimes grown in the greenhouse.

Leaves opposite or rarely ternately whorled or alternate, dentate or usually incised or dissected, rarely entire: spikes terminal, sometimes densely imbricated, sometimes elongated, slender and remotely flid., sometimes broadly corymbose or paniculate on an erect st., rarely axillary: fls. small or medium-sized, sessile; calyx tubular, 5-ribbed, 5-toothed; corolla-tube straight or incurved, limb spreading, somewhat 2-lipped, lobes 5, oblong or broad, obtuse or retuse; stamens 4, in pairs; ovary entire or very shortly 4-lobed at apex, 4-celled, cells 1-ovuled: fr. separating into 4 narrow pyrenes or nutlets.—About 80-100 species, chiefly natives in Trop. and extra-Trop. Amer. Some of them are unshowy weedy plants in fields and waste grounds in the U. S. and Canada. For the lemon verbenas (*V. citriodora*), see *Lippia citriodora*.

Verbenas rank high among plants grown as garden annuals. Their clusters of showy and often fragrant flowers are borne in constant succession from June till frost. They vary from white through lilac and rose to purple and dark purplish blue, with shades of pink and pale yellow. The clusters are about 2 inches across and contain a dozen or more flowers each $\frac{1}{8}$ to $\frac{1}{2}$ inch across. The plants are grown with ease in any usual garden soil and condition. For general purposes, the plants should be grown from seeds. The plants are set about 1 foot apart each way, although a strong plant in good soil may spread 3 feet or so in the course of the season. Usually the seeds are started indoors, but if sown in the open as soon as the season is settled and warm, flowering plants should be secured in July or early in August. The verbenas of gardens is a semi-trailer, the flower-stems not rising more than about a foot or so. It is sometimes used as a ground-cover under gladioli, lilies, and other tall plants, and in the margins of shrubby plantations. It also makes an excellent window-box subject.

When special colors or named varieties are desired it is necessary to propagate verbenas by cuttings. To propagate a particularly choice variety by cuttings, shorten back the plants about September 1, keep them well watered, and by the end of the month there will be plenty of quick tender growth suitable for cutting. Put the cuttings in the propagating-house or even in flats with soil in bottom and sand on surface. Place the flats in a coldframe, and keep them moist and shaded until the cuttings are rooted. When rooted, transfer to flats in a cool light house until after New Year's. Then pot them, using $2\frac{1}{2}$ -inch pots, and allow a temperature of 50° F., which will soon give plenty of material for additional cuttings. Verbenas increased from cuttings tend to flower early, and those propagated in February or March will require at least one pinching. When planting-out in beds for summer bloom, bend the plant over nearly to the horizontal, so that the new growth will spread along the surface of the soil. These shoots will take root quickly, thereby covering the ground. The old method was to peg the plants down.

In propagating general stock, sow the seed in February and pot into 2-inch pots as soon as the seedlings are up an inch. A temperature of 45° to 50° will answer, but they should have full light. There is no place equal to a mild hotbed for young verbenas. About April 15 plunge the pots in a few inches of soil in a mild hotbed. Lift them now and then and rub off the roots which go through the bottom of the pot, in order to check growth and hasten flowering. Customers want to see them in flower before buying, and most of them wait till the end of May. However, verbenas may be planted out early in May, as a slight frost will not injure them.

The evolution of the garden verbenas has taken place in about seventy-five years. Although the history can be made out with considerable clearness, yet the botanical origin of the present florist's race, as to the species involved and the extent to which they have contributed, is not satisfactorily recorded. It is probable that four species have been more or less fused in the race or group known as *Verbena hybrida*.—*V. chamædryfolia*, *V. phlogiflora*, *V. incisa*, and *V. teucrioides*. These species are shown in Fig. 3910. For an historical account of the development of the garden verbenas, see Cowen, "Cyclopedia of American Horticulture," Vol. IV.

It is impossible satisfactorily to classify the hybrid garden verbenas according to their botanical derivation. They are conveniently classed according to color of flowers into: (1) Selfs, or one-colored varieties; (2) Oculatas, or eyed varieties; and (3) Italians, or striped varieties. As to habit they may be divided into: (1) Standards, those of the ordinary loose, spreading growth; and (2) Compactas, which are much reduced in stature and of more condensed form. Verbenas now in cultivation are shown in Figs. 3910, 3911.

Latin trade names probably mostly or entirely belong with the garden or hybrid race of verbenas, such as *compacta*, *coccinea*, *grandiflora*, *monstrosa*, *cærulea*, *candidissima*, *italica*, *auriculæflora*, *striata*.

A. Connective of the upper anthers not appendaged.

B. Clusters not panicled. Prototypes of the garden verbenas (*V. hybrida*, Hort. Fig. 3911).

C. Fls. scarlet.

1. *chamædryfolia*, Juss. Fig. 3910. Characterized by red fls. in flattish clusters, oblong, coarsely scalloped, nearly sessile lvs. and rather stiff pubescence: sts. slender, forking, creeping at base, hirsute: branches somewhat ascending: lvs. oblong or ovate, base broadly cuneate, contracted into the short petiole, crenate or subincisely serrate, serrations often unequal, strigose above, below hairy, especially on nerves: peduncles elongated, ascending: spikes solitary, capitate: bracts lanceolate-subulate, ciliate: calyx hirsute-canescens, sparingly glandular, more than twice as long as the bracts; corolla crimson, limb irregular.—Occurs in two rather distinct forms: var. *Melindres*, Hort., has oblong to oblong-lanceolate lvs., which are unequally incised-serrate. This form is less hirsute and is more graceful and vigorous. It was the form first intro. to cult. Var. *melindroides*, Hort., has shorter, broader lvs. and is more hairy. Different forms occur over S. Brazil, Uruguay, Paraguay, and the whole of the Pampas. B.R. 1184. L.B.C. 16:1514. B.M. 3333. P.M. 1:173. B. 3:129.

CC. Fls. rose or purple.

D. Fl.-clusters oval to oblong: lvs. saw-toothed.

2. *phlogiflora*, Cham. (*V. Tweediana*, Niven). Fig. 3910. Characterized by rosy or purple fls. in oblong or

oval clusters; resembles No. 1, but has more upright habit, softer pubescence and larger, longer-pointed, distinctly petioled lvs.: sts. ascending; branches rather erect, much subdivided, angled, retrorsely hirsute: lvs. oblong or lanceolate-triangular, acute, base entire, cuneately long-attenuate into the evident petiole, unequally subincised serrate, somewhat venosely rugose, strigose above, below hairy or strigillose pubescent: spikes terminal, pedunculate, many-fl., oval to oblong: bracts short-ovate to subulate-lanceolate: calyx twice as long as bracts, covered with short pubescence interspersed with short capitate glandular hairs. S. Brazil and Uruguay. B.M. 3541. P.M. 4:5. B. 2:60.

DD. *Fl.-clusters flat or convex: lvs. more deeply and sharply cut.*

3. *incisa*, Hook. Fig. 3910. Rosy or purple-fl. species with lvs. more deeply cut than in the two preceding: whole plant hairy-pubescent; sts. ascending;

pinkish, long exserted, twisting in age, fragrant. S. Brazil, Uruguay, Argentina, Chile, and Peru. P.M. 5:243. B.M. 3694.

BB. *Clusters paniced.*

5. *venōsa*, Gill. & Hook. Differs from all other cult. kinds by paniced infl. and tuberous roots: herbaceous perennial, 1 ft. high: sts. simple, rhizomatic, creeping at base, ascending, 4-angled, hairy: lvs. rigid, oblong to oblong-lanceolate, the subcuneate base entire and half-clasping, acute at apex, unequally subincisely dentate, the teeth openly acuminate, nerves prominent, hirsute below: spikes in a close terminal panicle, subternate, lateral ones pedunculate, fastigiate and finally cylindrical: bracts subulate, ciliate, often purplish, exceeding the hairy calyx: corolla lilac or bluish purple to nearly sky-blue, very thinly villous without; tubes slender, thrice as long as calyx: fr. 1 line long, copiously fuscous outside, dorsal ridges 5. S. Brazil and Argentina.

3910. Four prototypes of the garden verbenas, drawn from early colored plates. From left to right: *V. chamædryfolia*, supposed chief parent of the reds; *V. phlogiflora* and *V. incisa*, the originals of the rosy and purple colors; and (right) *V. teucrioides*, a white flower which is probably chiefly, if not wholly, responsible for the fragrance of the hybrid verbenas.

branches erect: lvs. oblong-triangular, base cuneately truncate or subcordately attenuate into the evident petiole, pinnatifid lobed or deeply serrated and incised, upper lvs. sublanceolate, sessile, incisely pinnatifid: spikes terminal, pedunculate, subternate, flat or convex: bracts ovate: calyx 4 times as long as bracts, short-hairy, sprinkled with glandular hairs; corolla-tube glandular-pubescent, thrice as long as calyx; limb large, rose-purple, paler beneath, obovate lobes deeply marginate. S. Brazil, Paraguay, and N. Argentina. B.M. 3628.

ccc. *Fls. white.*

4. *teucrioides*, Gill. & Hook. Fig. 3910. Characterized by fragrant white fls. in very long clusters: sts. caespitose, rooting at base, ascending, terete, openly and copiously hirsute: lvs. ovate to oblong-triangular, base entire, sessile or nearly so, obtusely serrate, margins revolute, veiny-rugose, glandular-pubescent above, subtomentosely hispidulous on veins below: spikes terminal, solitary, glandular, hairy, lax, 5-9 in. long: bracts subulate-lanceolate, ciliate: calyx nerved, twice as long as bracts; corolla yellowish white or

B.M. 3127.—Tubers may be kept indoors over winter, or species prop. by seeds sown in greenhouse in Jan.

AA. *Connective of the upper anthers furnished with a glandular appendage.*

B. *Fls. violet or rosy purple.*

c. *Bracts half as long as calyx: plant a subshrub.*

6. *ténēra*, Spreng. (*V. pulchella*, Sw., not Hort.). Herbaceous perennial: sts. caespitose, decumbent, rooting; branches slender, 4-angled, ascending, sparsely hairy: lvs. decurrent into the short petiole, 3-parted and again pinnatifid into acute, linear, entire, subrevolute divisions, sprinkled with short hairs: spikes terminal pedunculate: calyx elongated, strigose pubescent or hairy, sprinkled at angles with short stipitate patella-form glands, twice as long as bracts; corolla rose-violet; anther appendages barely exserted, claviculate, subrevolute. S. Brazil and LaPlata region. Var. *Maonétti*, Hort., by some supposed to be a hybrid between *V. tenera* and *V. incisa* and by others to be a form of *V. tenera*, has rosy pink or carmine fls. rayed with white-margined corolla-lobes. Intro. from Italy and some-

times called Italian verbena. The name is variously spelled. Gn. 73, p. 31.

cc. Bracts about as long as calyx or a little shorter: plant annual.

7. *erinoides*, Lam. (*V. multifida*, Ruiz & Pav. *V. pulchella*, Hort., in part). MOSS VERBENA. Annual or perennial: st. strigose hairy or somewhat hirsute, branching, decumbent, rooting; branches ascending: lvs. ovate in outline, cuneate base decurrent into the petiole, deeply 3-parted and the divisions pinnatifid into narrow linear acute lobes, subrevolute on margins,

3911. The common garden verbena.—Sometimes known as *V. hybrida*. (×1)

strigose especially on nerves: spikes terminal, solitary, pedunculate, soon elongating and relaxing, canescent hairy: bracts lanceolate, acuminate, spreading, one-half as long to as long or longer than the calyx: corolla rather small, shortly exserted, lilac, bearded within; anther appendages exserted, rather short.—Said by Dr. Gillies to be “one of the commonest plants on the Alps of Chile and Mendoza . . . varying extremely in color of flowers, in stature and in degree in which the leaves are cut.” In some individuals the fls. are said to be scarlet, in others blue or purple. Forms assignable to this species occur also in the southern states of Brazil. The species is probably a composite one as now recognized. B.R. 1766 (as *V. multifida* var. *contracta*).—

Variable species characterized by distinct finely cut foliage and rosy lilac to deep purple fls., but the clusters and individual fls. are too small to make it popular.

BB. Fls. lilac: plants annual.

c. Lvs. twice pinnatifid.

8. *bipinnatifida*, Nutt. (*V. pulchella* of some seedsmen. *V. montana*, Hort., in part). Perennial, prostrate and rooting at base; sts. stout, upright, branched, 6–18 in. high: lvs. rather thick, petioled, 1–2½ in. long, scabrous above, ovate in outline, bipinnately parted or 3-parted into numerous oblong, rather acute lobes 1–3 lines broad: spikes solitary, dense to rather lax, at first capitate, becoming 2–4 in. long in fr.: corolla 5–8 lines long, purple or lilac, limb 4–5 lines broad, lobes emarginate to obovate; throat of corolla provided with a palisade of short hairs; upper stamens bearing each a small oval to oblong purplish gland. S. D. to Mex., east of the Rockies.—Fls. become bluish purple in drying.

cc. Lvs. once pinnatifid.

9. *canadensis*, Brit. (*Buchnera canadensis*, Linn. *V. Aubletia*, Jacq. *V. Aubletia* var. *Drummondii*, Lindl. *V. Drummondii*, Hort. *V. Lambertii*, Sims. *V. montana*, Hort., in part). Fig. 3912. Perennial, pubescent, with rather stiff hairs or glabrate: branches slender and ascending from a sometimes creeping rooting base, 6–18 in. high: lvs. ovate or ovate-oblong in outline, 1–3 in. long, truncate, broadly cuneate or subcordate at base and the petiole more or less margined, incisely lobed and toothed, often deeply 3-cleft: spikes peduncled, dense, short and capitate in early fl., becoming 2–4 in. long in fr.: bracts subulate, mostly shorter than the calyx—these and the calyx densely glandular-pubescent: calyx-teeth unequal, filiform-subulate; corolla 6–10 lines long, from bluish purple or lilac to rosy purple or white, frequently approaching blue in dried specimens; limb ½–¾ in. broad, lobes oblong or obovate, emarginate and more or less revolute near the sinuses, throat provided with palisade of short white hairs; upper anthers bearing each a light brown, oblong gland which is barely exserted. Colo. and Mex. eastward across the continent. B.M. 308; 2200. B.R. 294; 1925.—Reported as producing many garden and spontaneous hybrids. Garden forms are of stouter habit, less inclined to root at base: lvs. larger, dark shiny green above, more conspicuously veiny, clusters and individual fls. larger, and the color variation more striking. Many forms have a rich spicy fragrance quite different from that of the hybrid verbenas. On account of the robust healthy nature of *V. canadensis*, it has been frequently recommended in horticultural literature as desirable for hybridizing with the hybrid verbenas to improve their constitution. The cross would probably be too radical for best results. It is to be regretted that this charming species which is thought well of in Eu. should be neglected in its native country.

V. radicans is listed as an alpine species of trailing habit and with crimson fls., suitable for rock-gardens. The *V. radicans* of botanists (Gill & Hook.) is an Andean species with procumbent rooting sts., glabrous divided lvs. with ultimate segms. very narrow, and lilac-colored fragrant fls. in short head-like spikes.

J. H. COWEN.

L. H. B.†

VERBENA, LEMON: *Lippia*. V., Sand: *Abronia*.

VERBESINA (probably a meaningless alteration of *Verbena*). *Compositæ*. CROWNBEARD. Annual or perennial herbs, or some tropical species shrubby.

Leaves alternate or opposite, often decurrent: heads corymbose or solitary, of yellow or white fls.; rays sometimes wanting, pistillate or neutral: achenes flattened or those of the rays 3-sided, their margins winged or not;

pappus of 2 (1-3) awns, sometimes with 2 or 3 intermediate scales.—About 50 species, American. About a half dozen hardy perennial verbescinas have slight rank as garden plants, but the competition among yellow-fid. autumn-blooming composites is so great that verbescinas have little chance. They make acceptable wild-garden and back-border subjects.

occidentalis, Walt. (*V. Siegesbékia*, Michx. *Phæthusa occidentalis*, Brit.). Hardy perennial herb, 4-8 ft. high: lvs. ovate (uppermost oblong-lanceolate), acuminate,

species are native of the U. S., and are hardy perennial herbs of attractive appearance, with rather large heads of purple fls. in terminal clusters in late summer or early fall. Vernonias are of easy cult. in any good, rich border, being easily prop. by division. Very satisfactory groupings can be made with vernonias and native asters and goldenrods.

A. Heads 50-70-fld.

crinita, Raf. (*V. arkansana*, DC.). St. 8-10 ft. high: lvs. linear-lanceolate, 4-12 in. long, alternate-acuminate, glabrous or somewhat pubescent: peduncles not branched: involucre green, the filiform tips often reddish and the pappus often purplish. Plains, Mo., Kans. to Texas. July-Sept. Var. *alba*, Hort., has white fls.

AA. Heads 15-40-fld.

B. Lvs. narrowly linear.

c. Plant about 1 ft. high.

Lindheimeri, Gray & Engelm. St. excessively leafy up to the infl.: lvs. $1\frac{1}{2}$ -3 in. long by 1-2 lines wide, white-tomentose, with revolute margins: fls. in a corymbiform cyme. July-Sept. Rocky hills, W. Texas.

cc. Plant 2-4 ft. high.

Léttermannii, Engelm. St. fastigiate and cymosely much branched at the summit: lvs. 2-4 in. long, only 1 line wide, much crowded and very numerous; margins not revolute: fl.-heads numerous, $\frac{1}{2}$ in. long, 10-14-fld. July-Sept. Sandy soil, Ark.

BB. Lvs. not narrowly linear.

c. Bracts of involucre tipped with slender awns.

noveboracensis, Willd. Fig. 3913. St. 3-6 ft.: lvs. oblong to oblong-lanceolate, 3-9 in. long: heads in an open cyme: involucre commonly brownish or dark purplish: fls. deep purple, rarely white. Usually in moist soil. July-Sept.—The only common species of the E. U. S. and often used in the wild-garden.

cc. Bracts not awned.

d. Plant tomentose.

Baldwinii, Torr. St. 3-7 ft. high: lvs. oblong to ovate-lanceolate, 4-8 in. long, rather numerous: bracts greenish, acute or acuminate, tips spreading or reflexed: fls. purplish, blooming earlier than most species, in July and Aug. Prairies, eastern Mo. to Texas.

dd. Plant glabrous.

E. Lvs. thin.

altissima, Nutt. (*V. maxima*, Small). St. 5-10 ft. high: lvs. veiny, lanceolate or lanceolate-oblong, 4-12 in. long, usually long-acuminate and finely serrate: infl. loosely branched and open, the fls. purple: bracts obtuse or merely mucronate-tipped, closely appressed. July-Sept. W. Pa. to Ill., La., and Fla.

EE. Lvs. thickish.

fasciculata, Michx. St. 2-5 ft. high: lvs. somewhat obscurely veined, linear to oblong-lanceolate, 3-6 in. long: heads numerous and crowded on the branches of the cyme, 20-30-fld.: bracts obtuse or some of the upper mucronate-acute, closely appressed. July-Sept. Ohio and Ky. to the Dakotas and south to Texas. Grows on prairies and in moist soil; variable southward.

3913. Isolated specimen clump of ironweed. — *Vernonia noveboracensis*.

3912. *Verbena canadensis*; formerly known as *V. Aubletia*. ($\times\frac{1}{2}$)

serrate, the larger ones 8 in. long, contrasted into a marginal petiole: rays styliferous and usually fertile: awns of pappus not hooked. Dry hillsides, E. U. S.—A robust and rather coarse plant, growing 4-8 ft. high, and suitable only for the wild-gardens and the back row of the hardy border. It is doubtless of the easiest cult. It blooms from Aug. to Oct., and has numerous yellow fls. $\frac{1}{2}$ -1 in. across in flattish clusters.

crocata, Less. A much-branched, hairy perennial with a fleshy 4-winged st.: lvs. opposite, decurrent, irregularly pinnately lobed, the lobes usually ovate and much toothed: fls. in solitary, peduncled heads, not very showy: achenes quite glabrous. Mex.—Offered by Montaroso Nursery at Santa Barbara, otherwise little known. Perhaps not hardy north of Washington.

V. Purpusii, T. S. Brandeg. Dwarf: lvs. in a rosette, elliptic, 4-5 in. long: scapes 8-12 in. long, each bearing a solitary fl.-head $1\frac{1}{4}$ -2 in. across; ray-florets deep golden. Mex.—*V. virginica*, Linn. (*Phæthusa virginica*, Brit.). VIRGINIA CROWNBEARD. A hairy-stemmed perennial with winged branches and white corymbose-paniculate heads has been offered. It is a wild-garden subject that would be good to naturalize. E. N. Amer. Gt.. 47, p. 132.

N. TAYLOR.†

VERNONIA (after Wm. Vernon, an English botanist who traveled in North America). *Compósita*. *IRON-WEED*. Perennial herbs or in the tropics shrubs and trees.

Leaves alternate, pinnately veined: fls. usually purple or rose, borne in the following species in terminal cymes: heads not glomerate, several to many exclusively tubular-fid.: involucre of dry or partly herbaceous, much-imbriicated bracts: corolla regularly 5-cleft into narrow lobes: achenes 8-10-ribbed, with a blunt apex and a cartilaginous, callous base; pappus double (at least in American species).—About 560 species widely scattered about the world, but is possibly most plentiful in S. Amer. The latest monograph is that by H. A. Gleason in Bull. N. Y. Bot. Gard. 4:144-243, 1906. The following

V. Arechavalète, André. Glabrous shrub, 3-6 ft. high: lvs. sessile, leathery, linear-lanceolate: fl.-heads reddish violet. Uruguay.
—*V. gigantea*, Hort. Robust: fl.-heads in panicles, carmine or violet-rose.

F. W. BARCLAY.
N. TAYLOR.†

VERÓNICA (named in honor of St. Veronica). *Scrophulariaceae*. SPEEDWELL. Annual and perennial herbs, shrubs, or rarely trees, one group of which, mainly European and American species, are hardy in the North, the other group, New Zealand species, are hardy in California and similar climates and are also somewhat used as greenhouse plants.

Leaves opposite, rarely whorled or rather few; cauline lvs. very rarely alternate; floral lvs. always alternate: fls. disposed in terminal or axillary bracteate racemes, or rarely solitary in the axils of alternate lvs., blue, purple, flesh-colored, or white, never yellow; calyx 4-5-parted, very rarely 3-parted; corolla-tube short, usually very short, limb spreading, 4-5-cleft; stamens 2: caps. compressed or turgid, 2-grooved, loculicidally dehiscent, usually obtuse or emarginate.—About 300 species, mostly natives of the temperate and colder regions, a few in the tropics. Veronica was monographed by Bentham in DC. Prod. 10:458-491 (1846), 158 species being then known. About 200 species are now known, very widely distributed.

All are showy free-flowering plants, used, except the shrubs, as garden perennials or annuals, and are propagated by seeds, the perennials also by division, the shrubs by cuttings in spring or summer. They succeed in any good garden soil in a sunny situation. The lower-growing forms are good rock-plants; the taller are adapted to the herbaceous border. The shrubby forms are greenhouse plants or grown only in warmer parts of the country, particularly California, where they are everblooming, and where they do well along the coast even in exposed places by the sea. The shrubby species are mostly natives of New Zealand. They are well reviewed in *The Garden* 45, page 506, and 28, page 292. Some of them have enjoyed a considerable popularity in England, where they are generally seen in cool conservatories, but they survive the winters outdoors in the most favored parts of the British Isles. The first hybrid was raised in 1848 by Isaac Anderson-Henry (then Isaac Anderson), a noted hybridizer. This gentleman continued his experiments for several years, using *V. speciosa*, *V. salicifolia*, and *V. elliptica*. His work was continued by others, and most of the hybrid veronicas of today have the parentage above indicated, with the blood of *V. speciosa* generally much in evidence. If a collective name for veronica hybrids is desired, *V. speciosa* var. *hybrida* is the best name for the whole group. Unfortunately all these hybrids are unfit for general cultivation out-of-doors in northern climes, but a harder race will probably be secured by using *V. Traversii* and its allies, which have been introduced more recently. Some of these are *V. Colensoi*, *V. anomala*, *V. monticola*, and *V. pimeleoides*,—all unknown to the American trade. A third and still harder group of the New Zealand speedwells is the truly alpine group known as whipcord veronicas. These should be hardy in many northern rockeries. They are unknown in America now. The best of the group is said to be a form of *V. cupressoides*, known to English trade as *V. salicornioides*. Others in cultivation are *V. Hectorsii*, *V. Armstrongii*, and *V. lycopodioides*. (A. P. Wyman.)

The New Zealand veronicas (Cockayne).

In New Zealand the veronicas comprise a marked feature in the flora, being represented by many shrubby and semi-shrubby kinds. Several of these species are well-known evergreen garden plants in California and parts of Europe. The following comment on the New Zealand veronicas is by L. D. Cockayne, Wellington; and the systematic treatment of these species is also founded on manuscript contributed by him.

Excepting the Tasmanian *V. formosa*, the shrubby species are natives of New Zealand where they occur in all kinds of stations and at all altitudes. In their native land, and in Great Britain and Ireland, they are now widely cultivated, but, unfortunately, none can be considered perfectly hardy in the northern states, though, where the cold of winter does not sink much below 12° F., many of the species should thrive admirably. All can be readily propagated from seeds or cuttings. If the latter are taken from adult plants in the autumn, they will bloom during the succeeding summer, and if bedded out on the rockery are most effective.

The genus in New Zealand contains more than 100 species, while nearly all of these can be subdivided into several distinct varieties. There are also astonishing differences in their growth-forms. Some are trees and others shrubs, which latter are erect or prostrate, compact and ball-like or wide-spreading, densely leafy or

3914. *Veronica longifolia* var. *subsessilis* (×¼). No. 6.

the leaves reduced to adpressed scales so that the plant resembles a cypress (the whipcord veronicas). The flowers also differ considerably and may be in small heads, racemes of different length, corymbs, or long branched panicles. The usual color is white, but crimson, lilac, violet, and blue are met with. Usually the leaves are bright green and perhaps glossy, but in some species, and this is a sign of hardiness, they are of a pleasing pale glaucous hue.

The compact shrubby species lend an admirable effect to the garden landscape when massed together on banks, many looking as if trimmed into a ball-like form by the gardener's hand. Most forms tolerate clipping to any extent. Some, especially *V. elliptica*, *V. angustifolia*, and *V. leiophylla*, make excellent evergreen hedges. A small form of the polymorphic *V. buxifolia* can be used as an edging after the manner of the box.

The species are exceedingly difficult to determine and errors abound in garden nomenclature, while unpublished names are frequent. Natural hybrids also occur and this brings in further confusion. Also, there are a number of garden hybrids in cultivation, mostly between *V. speciosa* and its nearer relatives. Much more important for colder countries are the

hybrids due to crossing the more hardy alpine species. So far as American gardens are concerned the following, not yet introduced or rare in cultivation (some of them not here described), would be desirable novelties: *V. Dieffenbachii*, *V. gigantea*, *V. Barkeri*, *V. Lewisii*, *V. leiophylla*, *V. Bollonsii*, *V. anomala*, *V. vernicosa*, *V. monicola*, *V. Menziesii*, *V. decumbens*, *V. tetragona*, *V. Armstrongii*, *V. propinqua*, *V. loganioides*, *V. Lavaudiana*, and *V. Raoulia*. Those desiring more information about the shrubby veronics should consult Cheeseman's "Manual of the New Zealand Flora," Wellington, 1906, and the subsequent volumes of the "Transactions of the New Zealand Institute."

KEY TO THE SECTIONS.

- A. Infl. terminal. (See also No. 32.)
 B. Lvs. bearing fl.-shoots alternate (annuals).
 Section IV. OMPHALOSPORA. Species 19, 20.
 BB. Lvs. all opposite.
 C. Corolla-tube lacking or very short.
 Section III. VERONICASTRUM. Species 9-18.
 CC. Corolla-tube long.
 D. Caps. ovate or oblong.
 Section I. PÆDEROTA. Species 1, 2.
 DD. Caps. suborbicular.
 Section II. PSEUDOLYSIMACHIA. Species 3-8.
 AA. Infl. axillary.
 B. Plants shrubs, or trees, rarely herbs: caps. turgid.
 Section VII. HEBE. Species 41-60.
 BB. Plants herbaceous (base decumbent and often becoming woody): caps. laterally compressed.
 C. Caps. only slightly compressed.
 Section V. BECCABUNGA. Species 21.
 CC. Caps. strongly compressed and transversely broader.
 Section VI. CHAMÆDRYS. Species 22-40.
 Section I. PÆDEROTÆ.
 A. Lower lvs. orbicular. 1. Bonarota
 AA. Lower lvs. lanceolate. 2. virginica

1. *Bonarota*, Linn. (*V. chamædryfolia*, Wettst. *Pæderota Bonarota*, Linn. *P. chamædryfolia*, Brign.). Perennial, pilose: sts. 4-6 in. high: lower lvs. orbiculate, scarcely 1 in. long; upper lvs. ovate or lanceolate, serrate or incised: spike globose or oblong, compact, 1-1½ in. long: fls. blue, about ½ in. across; calyx-segms. linear-subulate. Italian Alps and Tyrol.

2. *virginica*, Linn. (*Leptandra virginica*, Nutt. *V. verticillata*, Hort.). CULVER'S ROOT. Erect, simple, somewhat pubescent herb 2-6 ft. tall: lvs. in whorls of 4-6, lanceolate, 2-4 in. long, smooth above, pubescent below, acutely serrate, short-petioled: racemes terminal, erect, long, dense: fls. many, white or pale blue, short-pedicelled: caps. longer than broad, pointed, twice exceeding the calyx. Aug.-Sept. Eastern states. Gn. 79, p. 259.—Free-growing herb. Likes rich soil and much sun. While stiff and coarse, it is bold and stately. Var. *alba*, Hort. (*V. verticillata* var. *virginica alba*, Hort.), is offered in the trade as a form growing 4 ft. high, with erect spikes of white fls. Var. *japonica*, Makino (*V. japonica*, Steud. *V. verticillata* var. *japonica*, Hort.), has pedicelled blue or white fls., the pedicel equaling or exceeding the calyx. Var. *sibirica*, Makino (*V. sibirica*, Linn. *V. verticillata* var. *sibirica*, Hort.), has sessile or subsessile blue or white fls.; pedicels always shorter than the calyx.

Section II. PSEUDOLYSIMACHIA.

- A. Foliage and st. white-pubescent or white-woolly.
 B. Base of lvs. cordate. 4. Bachofenii
 BB. Base of lvs. attenuate. 8. incana
 AA. Foliage and st. nearly glabrous.
 B. Lower lvs. pinnatisect. 3. pinnata
 BB. Lower lvs. merely serrate or crenate.
 C. Racemes panicle. 5. spuria
 CC. Racemes solitary or few.
 D. Lvs. lanceolate. 6. longifolia
 DD. Lvs. ovate-oblong. 7. spicata

3. *pinnata*, Linn. Strong, upright plant 2-3 ft. high, glabrous or pubescent: lvs. sparse or somewhat clustered, finely cut, the lower pinnate with spreading segms., the upper pinnatifid, thickish, shining, smooth: racemes slender, many-fld., elongated: fls. blue. June, July. Open mountain lands, Russia.

4. *Bachofenii*, Heuff. Perennial, white-pubescent: sts. several, ascending or erect, 1-2 ft. high: lvs. opposite, petioled, 1-2 x 1 in., cordate-oblong, acute, coarsely serrate: racemes terminal, 1-12, opposite, elongate: fls. blue; calyx-lobes 4, linear, subequal; corolla-tube inflated, lobes broad-lanceolate: caps. small, obcordate, slightly compressed, about equaling the calyx. Hungary.

5. *spuria*, Linn. (*V. paniculata*, Linn. *V. angustifolia*, Fisch., not Bernh. *V. incisa*, Soland. *V. amethystina*, Willd.). BASTARD SPEEDWELL. Upright, slender, densely pubescent species 2 ft. high: lvs. mostly opposite or ternate, 1 in. long, linear, acute, serrate-crenate toward the apex, entire below, smooth, narrowed at the base, thickish: racemes numerous, panicle, long, densely many-fld.: fls. blue, pedicelled: caps. nearly round, thick, exceeding the sepals. May, June. G.W. 7, p. 437. Woods, S. E. Eu. and S. Russian Asia.—Becomes weedy late in the season. Var. *elegans*, Voss ex Wyman (*V. elegans*, DC. *V. paniculata* var. *elegans*, Benth.), has the lvs. pubescent on both surfaces and is more branched than the type. Belgium. Variants of this variety are known in horticulture as *V. elegans* var. *carnea*, Hort., a form growing 1 ft. high and having spikes of rich pink fls. and the variegated form as *V. elegans carnea variegata*.

6. *longifolia*, Linn. (*V. maritima*, Linn. *V. hybrida*, Georgi, not Linn. *V. persicifolia*, Schott. *V. bracteata*, Opiz, not Willd.). Strong, leafy, upright, densely growing species 2½ ft. high, with usually a smooth st.: lvs. lanceolate or oblong-acuminate, sharply serrate, lower

opposite, upper more or less verticillate, pubescent below, very acute, $2\frac{1}{2}$ –4 in. long: racemes long, erect, spiciform, dense: fls. lilac, numerous: caps. longer than broad, notched, a little exceeding the linear sepals or sometimes exceeded by them. Becomes black in drying. July–Sept. Wet fields, Cent. and E. Eu. and N. Asia.—Much cult. and hybridized. Has several varieties. A fine border plant and the most common species, growing and flowering freely in any good soil. Var. *alba*, Hort. (*V. maritima* var. *alba*, Hort.), grows 1–1½ ft. high: fls. white. Var. *glauca*, Hort., has glaucous blue foliage: fls. rich purple. Var. *rosea*, Hort. (*V. rosea*, Hort. *V. hybrida rosea*, Hort. *V. maritima* var. *rosea*, Hort.), a probable variety with pink fls., 2 ft. high and much branched. Hardy in Mass. Prop. by division and cuttings. Var. *subsessilis*, Miq. (*V. subsessilis*, Hort.). Fig. 3914. More erect, compact and robust than the type, 2–3 ft. high, growing in clumps with numerous side branches and of a good habit: lvs. 2–4 in. long, according to the richness of the soil: spikes longer and fls. larger than of the type and of an intense lustrous blue. Aug.–Oct. Japan. B.M. 6407. R.H. 1881:270. G.C. II. 16:789. J.H. III. 59:253. A good border plant and considered the best speedwell; thrives in deep rich soil in an open position. Var. *villòsa*, Hort. (*V. villòsa*, Schrad. *V. crenulata*, Hoffm.). A Siberian form with narrower lvs. than the type and large blue fls. Lvs. serrate or doubly notched or incised.

7. *spicata*, Linn. (*V. crassifolia*, Wierzb. *V. hybrida*, Linn.). Ascending or erect, slender sts. 2–4 ft. high, growing from a shortly creeping, almost woody rootstock: lvs. lanceolate, lance-oblong or the lower ovate, opposite or verticillate, crenate, downy, $1\frac{1}{2}$ –2 in. long, thick: racemes long, upright, densely many-fl.: fls. pedicelled, clear blue or sometimes pale pink; stamens very long, purple: caps. longer than broad, notched, thick, exceeding the broad hairy sepals. June–Aug. Hilly pastures, Eu. and N. Asia. Gn. 68, p. 55:78, p. 157. J.H. III. 47:15.—Thrives in an open soil away from shade. Regarded as one of the better border speedwells. Var. *alba*, Hort. (*V. crassifolia* var. *alba*, Hort.), is said to grow 6–18 in. high and have white fls. Var. *corymbòsa*, Hort., is offered in the trade as a form growing 1 ft. high: fls. pale blue. Var. *nana*, Hort., is offered as a form 6–9 in. high: fls. blue. Var. *rosea*, Hort., grows 15–18 in. high: fls. purplish pink, showy. July and early autumn. Var. *superba*, Hort., is offered in the trade as growing 2 ft. high and having long spikes of violet fls. Var. *variegata*, Hort., is offered as a form growing 1½ ft. high, with variegated foliage and blue fls.

8. *incana*, Linn. (*V. candida*, Hort. *V. neglecta*, Vahl). Strong, upright or ascending, white-woolly plant 12–18 in. high, with many sterile matted branches and fewer fertile erect branches: lvs. opposite, acute, lower oblong, upper lanceolate, 1–3 in. long, white-tomentose: racemes erect, solitary to several, 3–6 in. long: fls. many, blue, short-pedicelled: caps. longer than broad, thick, exceeding the woolly calyx. July–Sept. Fields and mountain regions. N. Asia, and S. W. Eu.—Resembles *V. spicata* in habit. Has a good appearance both in and out of bloom; useful in the rockery, border, or geometrical garden. Var. *candidissima*, Hort., has lvs. larger and not so hoary as the type: fls. pale blue. Var. *glauca*, Hort., is offered as a form with silvery foliage and deep blue fls.

Section III. VERONICASTRUM.

- A. Duration annual: floral lvs. usually about like the lower cauline lvs. (Subsection 4. *Annua*.)
 B. Cauline lvs. sessile. 17. *syriaca*
 BB. Cauline lvs. petioled. 18. *glauca*
 AA. Duration perennial, base usually somewhat woody: floral lvs. usually much smaller than the lower cauline lvs.

- B. *Habit erect or ascending: raceme usually somewhat elongated.* (Subsection 3. *Alpina*.)
 C. Plants 2–6 in. high.
 D. Fls. blue or violet. 14. *alpina*
 DD. Fls. rose or white. 16. *repens*
 CC. Plants ½–4 ft. high (seldom less than 9 or 10 in.).
 D. Lvs. 1–3 in. or more long. 13. *gentianoides*
 DD. Lvs. ¼–½ in. long. 15. *serpyllifolia*
 BB. *Habit diffuse, low and much branched: raceme usually much shortened.*
 C. Infl. capitate, several-fl. (Subsection 1. *Diffusæ*.)
 D. Blades linear-spatulate. 10. *cæspitosa*
 DD. Blades ovate, orbicular or oblong-spatulate.
 E. Surface of lvs. glabrous. 9. *Nummularia*
 EE. Surface of lvs. white-tomentose. 11. *bombycina*
 CC. Infl. a very short (in fr. elongated) raceme, few-fl. (Subsection 2. *Fruticulosæ*.) 12. *fruticulosa*

Subsection 1. DIFFUSÆ.

9. *Nummularia*, Gouan. Perennial: sts. slender, creeping, becoming somewhat woody, diffusely branched: lowest lvs. scale-like, the others clustered, ovate-orbicular, obtuse, entire, about 2 lines long, rather thick, glabrous: racemes somewhat capitate, pubescent: fls. blue or pink; corolla with the lowest segms. much larger than the others: caps. small, broad, rather glabrous. Pyrenees.

10. *cæspitòsa*, Boiss. Perennial, diffuse, cespitose: sts. 1–3 in. high, densely foliate: lvs. rather thick, about ½ in. long, clustered, linear-spatulate, obtuse, entire, margin revolute: raceme subsessile, 1–4 fl.: fls. large, rose; calyx lanate, segms. oblong-linear: caps. glabrous, obcordate, transversely broader. Greece, Asia Minor, and Syria.

11. *bombycina*, Boiss. & Kotschy. Perennial, low, cespitose, forming cushions, appressed white-silky: lvs. very small, about 2 lines long, sessile, ovate or oblong-spatulate: fls. 1–5, terminal, reddish; calyx-teeth oblong, obtuse; corolla more than twice as long as calyx: caps. small, orbicular, tomentose. July. Syria.—In the trade abroad this species is described as having pale lavender fls.

Subsection 2. FRUTICULOSÆ.

12. *fruticulòsa*, Linn. (*V. saxatilis*, Scop.). Perennial or shrubby: sts. diffusely branched, 2–6 in. high, woody at base: lvs. ¼–½ in. long, oblong or obovate, entire or subrenate: raceme lax, short, few-fl., pubescent: fls. blue or flesh-colored: caps. ovate. July. Mountains of Eu. and Greenland. There is a white-fl. form horticulturally known as *V. saxatilis alba* and also a form known in the trade as *V. saxatilis Grièvei*.—Possibly not all material known as *V. saxatilis* belongs here.

Subsection 3. ALPINÆ.

13. *gentianoides*, Vahl (*V. glàber*, Hort.). Erect, slender, tufted species 6–24 in. high, from creeping roots: lvs. obovate or oblong, some lanceolate or linear, thickish, entire or small crenate, smooth, 1–3 in. long; root-lvs. more or less in rosettes; upper lvs. bract-like, smaller and narrower: raceme elongated, leafy, many-fl., hairy: fls. pale blue, with darker streaks, on long pedicels: caps. nearly round, slightly notched, exceeding the calyx. Wet alpine fields, S. E. Eu. B.M. 1002.—A hardy species in any soil or location, shade-enduring though not necessarily shade-loving, blooming early. Prop. by division. Forms a mat and makes a good ground-cover for bare spots in midsummer; also a valuable border plant. One of the earliest. Var. *alba*, Hort., is a white-fl. form. Var. *foliis variegatis*, Hort.,

see var. *variegata*. Var. *pállida*, Hort., is offered in the trade as a variety with pale porcelain-blue fls. Var. *pallidiflora*, Hort., is a trade name, perhaps the same as var. *pállida*. Var. *stenophylla*, Hort., is a narrow-ld. form. Var. *variegata*, Hort., is offered in the trade as having lvs. variegated with creamy white. G.M. 54:575.

14. *alpina*, Linn. A slender delicate plant growing from a creeping stock, branching at the base, becoming ascending or upright, the fl.-st. often solitary, 2-6 in. high: lvs. opposite, occasionally alternate, subsessile, elliptic or oblong, entire or dentate, about $\frac{1}{2}$ -1 in. long, of varying size, the lowest small, orbicular: raceme short, spiciform, dense: fls. small, blue or violet: caps. $\frac{1}{4}$ in. long, oblong, longer than broad, hairy, exceeding the calyx. Mountains of Eu., Cent. and N. Asia, and alpine and arctic regions in Amer. B.M. 2975.—Adapted to the rock-garden. It blackens when dried.

15. *serpyllifolia*, Linn. (*V. alpestris*, Hort.). St. PAUL'S SPEEDWELL. Slender, ascending, nearly smooth plant, growing irregularly in clumps 2-4 ft. high, the base prostrate and rooting: lvs. ovate or oblong, crenate, $\frac{1}{4}$ - $\frac{1}{2}$ in. long, smooth, variable: racemes loose, with conspicuous bracts: fls. pedicelled, whitish or pale blue with deeper stripes: caps. wider than long, obtusely notched, exceeding or equal to the sepals. May-July. Roadsides and fields, Asia, Eu., N. Afr., N. and S. Amer.

16. *rèpens*, DC. Prostrate, slender, compact plant growing in dense masses: lvs. $\frac{1}{4}$ - $\frac{1}{2}$ in. long, ovate, slightly crenate, shining green and moss-like: racemes slender, few-fl.: fls. rose or nearly white, with a trace of blue: caps. broader than long, deeply notched, exceeding the sepals. May. Corsica.—Hardy in Mass. and intro. in Calif. Allied to *V. serpyllifolia* but dwarfer and more prostrate. Grows in the sun. Will cover the ground where grass does not grow, forming a sod in a short time; prefers moist corners but thrives on a moderately dry soil. Var. *álba*, Hort., is a white-fl. form.

Subsection 4. ANNUE.

17. *syriaca*, Roem. & Schult. (*V. pedunculata*, Labill., not Vahl). Ascending, diffusely branched pubescent annual, 6-12 in. high: lvs. ovate or ovate-lanceolate, incised or dentate, smooth; lower petiolate, upper subsessile, $\frac{1}{2}$ in. long: raceme terminal, slender, 4-6 in. long: fls. blue, with thread-like pedicels $\frac{1}{2}$ in. long: caps. broader than long, notched two-thirds of its length, exceeding the sepals. June. S. W. Asia. R.H. 1897, p. 311. F.S. 12:1259. Var. *flöre-álbo*, Hort., is a white-fl. form.

18. *glauca*, Sibth. & Smith. Annual, suberect, branched; branches opposite, pubescent: lvs. $\frac{1}{2}$ - $\frac{3}{4}$ in. long, short-petioled, broadly ovate, obtuse, crenate-dentate; floral lvs. bract-like, 2-3-lobed: fls. $\frac{3}{4}$ in. across, bright blue, throat white; calyx pubescent, segms. unequal, in pairs, elliptical: caps. suborbicular, retusely truncate. Greece. B.M. 7759.

Section IV. OMPHALOSPORA.

- A. Calyx-segms. ovate-lanceolate.....19. *Tournefortii*
AA. Calyx-segms. oblong-elliptic.....20. *filiformis*

Subsection AGRESTES.

19. *Tournefortii*, C. C. Gmel. (*V. Buxbaumii*, Tenore). Prostrate annual, with elongated slender pubescent sts., the lower branching and often rooting: lvs. ovate, subcordate, coarsely crenate-serrate, pubescent, shortly petioled, $\frac{3}{4}$ in. long, the lower opposite, the upper alternate and similar: racemes axillary: fls. small, blue, scattering, on long pedicels, of long duration: caps. broader than long, very widely notched, exceeded by the sepals. April-Sept. Fields, Cent. and S. Eu., Asia and naturalized in N. Amer. F. 1846, p. 112.

20. *filiformis*, Smith. Annual or perennial, caespitose, dwarf, slightly papillose-pubescent: branches numerous,

filiform, elongated, prostrate and rooting: lvs. small, ovate or orbiculate, obtuse, subcrenate, subcordate, somewhat petioled: fls. on filiform axillary pedicels, blue; calyx-segms. elliptic: caps. ciliate, orbicular-obcordate, acute angled, 2-lobed to the middle. Asia Minor. G. 37:99.

Section V. BECCABUNGA.

21. *Michauxii*, Lam. Perennial, 4-5 ft. tall, everywhere pubescent: sts. erect, or ascending from rooting bases: lvs. ovate, crenate-dentate, lower and those of the sterile branches petioled, the others clasping: racemes few, rather dense, from the upper axils: fls. pale blue (drying reddish); calyx-segms. oblong, acute: caps. ovate-orbicular, turgid and glandular. Persia.

Section VI. CHAMÆDRYS.

- A. Calyx 5-parted. (See also No. 40.)
The species of this group are closely allied and often hard to distinguish.
(Subsection 1. *Pentasepalæ*.)
B. Lvs. bipinnatifid.
C. Base of caps. rotundate.....27. *filifolia*
CC. Base of caps. cuneate.....26. *multifida*
BB. Lvs. at most lobed, pinnatisect or even pinnatifid.
C. Caps. cuneate at base.
D. Blade pinnatifid.....26. *multifida*
DD. Blade at most incised-dentate...22. *orientalis*
CC. Caps. rotundate at base.
D. The lvs. often pinnatifid, when not so narrowly elongate-lanceolate.....25. *austriaca*
DD. The lvs. not lobed or pinnatifid, ovate to broadly lanceolate.
E. Margin of blade sharply serrate.....23. *latifolia*
EE. Margin of blade crenate or bluntly dentate.....24. *Teucrium*
AA. Calyx 4-parted (occasionally 5-parted in No. 40).
B. Racemes few-fl.: pedicels twice to many times longer than the calyx. (Subsection 5. *Petrææ*.)
C. Fls. solitary.....40. *canescens*
CC. Fls. racemose.
D. Color of fls. white.
E. Lvs. $\frac{1}{4}$ - $\frac{1}{2}$ in. long, serrate...38. *Lyallii*
EE. Lvs. $\frac{1}{6}$ - $\frac{1}{4}$ in. long, 1-2 teeth on each side.....39. *Bidwillii*
DD. Color of fls. blue.
E. Sts. crisply pubescent: caps. glandular-hirsute.....36. *petræa*
EE. Sts. glabrous or minutely white-puberulent: caps. glabrous.
F. Calyx-segms. broadly lanceolate.....35. *Baumgartenii*
FF. Calyx-segms. elliptic oblong.....37. *telephiifolia*
BB. Racemes many-fl.: pedicels shorter or only slightly longer than the calyx.
C. Infl. strict, almost spike-like. (Subsection 2. *Strictifloræ*.)
D. The racemes alternate.....30. *Allionii*
DD. The racemes opposite.
E. Cauline lvs. obovate-spatulate, rather narrow, often pinnatifid, $\frac{1}{2}$ - $\frac{3}{4}$ in. long.....28. *pectinata*
EE. Cauline lvs. elliptic-oblong, rather broad, never pinnatifid, usually about 1 in. or more long.....29. *officinalis*
CC. Infl. lax and spreading.
D. Caps. longer than broad. (Subsection 3. *Multifloræ*.).....31. *Chamædryis*
DD. Caps. broader than long. (Subsection 4. *Scutellatæ*.)
E. Raceme solitary (said to be terminal).....32. *pirolæformis*
EE. Racemes several.
F. Lvs. broadly ovate.....33. *montana*
FF. Lvs. linear-lanceolate....34. *scutellata*

Subsection 1. PENTASEPALÆ.

22. *orientalis*, Mill. Perennial, shortly and crisply pubescent, rarely glabrate: sts. from woody rhizomes, decumbent or prostrate: lvs. sessile, short, lower cuneate-oblong or lanceolate, dentate-incised, rarely entire; upper usually narrower, lanceolate: racemes 2-4, from the upper axils, secund: fls. flesh-colored or pale blue; calyx-segms. 4 or 5, linear-lanceolate, very unequal: caps. glandular-pubescent, obcordate or truncate. July. Asia Minor and Persia. L.B.C. 5:419. Var. *tenuifolia*, Boiss. (*V. taurica*, Willd.), has narrowly linear lvs., with the margins sometimes somewhat revolute, entire, rarely acutely few-toothed. S. Armenia and Persia. L.B.C. 10:911.

23. *latifolia*, Linn. (*V. urticæfolia*, Linn.). Perennial, sparsely and crisply hirsute: sts. erect: lvs. sessile, ovate, sharply serrate, base often cordate; upper long-acuminate: racemes opposite, laxly paniculate: fls. light blue or reddish; calyx-segms. minute, lanceolate, rather acute: caps. orbicular, base rotundate. Eu.—Horticultural material under this name is apt to be a broad-ld. form of *V. Teucrium*.

24. *Teucrium*, Linn. (*V. dentata*, F. W. Schmidt. *V. nitida*, Hort., ex Poir., not Ehrh.). Perennial, pubescent: sts. numerous, ascending, up to 20 in. high: lvs. ovate to linear-lanceolate, nearly entire, crenate to even bluntly dentate-incised, mostly sessile: racemes opposite, elongated: fls. large, blue, rarely rose or white; calyx-segms. oblong-linear to lanceolate: caps. obovate, base rotundate. Cent. and S. Eu. and Cent. Asia.—Variable. Var. *latifolia*, Hort. (*V. latifolia*, Hort., not Linn.), has broader lvs. Range of the type. Var. *prostrata*, Hort. (var. *dubia*, Hort. *V. prostrata*, Linn.), has a more prostrate habit, only the tips of the sts. upright. Minor forms of this variety are known in the trade as *V. prostrata* var. *alba*, Hort., with white fls.; *V. prostrata* var. *pygmaea*, Hort., is a small form. G.W. 8, p. 2. *V. prostrata* var. *satureiæfolia*, Hort. (*V. satireiæfolia*, Poit. & Turp.), has light blue fls. B.M. 3683. *V. rupëstris*, Hort., is quite possibly referable to var. *prostrata*.

25. *austriaca*, Linn. (*V. multifida*, Jacq., not Linn. *V. orientalis*, Willd., not Mill. *V. prænja*, G. Beck). Perennial, 1-2 ft. high, pubescent: sts. erect, rarely ascending: lvs. sessile, ovate in outline, pinnatisect, segms. oblong with their base narrowed or linear, entire or incised: racemes 2-4, from the upper axils, elongated, many-fld.: fls. large, blue; calyx-teeth 5, rarely 4, linear, strongly unequal: caps. hirsute, obovate-obcordate. S. E. Eu. and Asia Minor. Var. *angustifolia*, Benth. (*V. angustifolia*, Bernh.), is a form with linear-subulate lf.-segms. Caucasus region.—Material offered in the trade as *V. angustifolia* should also be compared with *V. spuria* and *V. scutellata*.

26. *multifida*, Linn. Perennial, shortly and crisply pubescent: sts. decumbent and indurated at base or diffuse: lvs. sessile, pinnatisect in linear, entire or dentate segms.: racemes 2-4, axillary: fls. flesh-colored or pale blue; calyx-segms. strongly unequal: caps. glabrous or short-glandular, transversely broader. June, July. Asia and Asia Minor. B.M. 1679.—Probably not common in cult. and some at least of the material so named is probably *V. austriaca*.

27. *filifolia*, Lipsky. Sts. several, ascending or erect, 6-12 in. high, crisply pubescent: lvs. sessile, bipinnatifid, divisions long, slender almost filiform: racemes 4-8, opposite, lax-fld.: fls. white, blue-veined, large; calyxlobes 4, almost equal, nearly linear, acute: caps. shorter than the calyx, strongly flattened, obcordate, transversely broader. Caucasus.—Near *V. multifida*.

Subsection 2. STRICTIFLORE.

28. *pectinâta*, Linn. Prostrate, white-pubescent, hairy, spreading plant rooting at the nodes, the ascend-

ing branches producing single elongated racemes: lvs. obovate or spatulate, sometimes pinnatifid, crenate, narrow at the base, sessile, pubescent, $\frac{1}{2}$ in. long: racemes elongated, many-fld.: lower bracts like lvs.: fls. deep blue with a white center: caps. large, longer than broad, notched, pubescent, thick, exceeding the sepals. May, June. Dry, shady hills. Asia Minor.—Suitable to dry spots in a rock-garden. Grows in almost any soil and position. Var. *rosea*, Hort., has numerous small spikes of rose fls.

29. *officinalis*, Linn. (*V. Allionii*, F. W. Schmidt, not Vill.). COMMON SPEEDWELL. FLUELLEN. GROUND-HELE. Prostrate, leafy native with a pubescent st. rooting at the nodes, slender, 6-18 in. long: lvs. elliptic, oblong or broadly oblong, $\frac{1}{2}$ -1 in. and more long, hairy, serrate at base, evergreen, retaining color where most exposed: racemes slender, densely many-fld.: fls. pale blue, rarely pink, sessile: caps. broader than long, wedge-shaped, broadly notched, hairy, exceeding the hairy sepals. May-July. Forests and mountains of Eu. and N. Amer.—Grows under trees and in shade where no grass will grow, covering the ground with a permanent sod. Spreads rapidly and is easily grown. Prop. by cuttings.

30. *Allionii*, Vill. Perennial, glabrous or slightly minutely puberulent: st. prostrate, rooting at the base: lvs. very short-petioled, obovate-elliptic or oblong, obtusely serrulate, base usually cuneate: raceme densely spicate; pedicels very short: fls. violet; calyx-segms. 4, lanceolate-linear, rather acute; corolla-lobes lanceolate: caps. obcordate, acute, puberulent. S. Eu.

Subsection 3. MULTIFLORE.

31. *Chamædrys*, Linn. (*V. pedunculata*, Vahl. *V. pulchella*, Salisb.). GERMANDER SPEEDWELL. ANGEL'S EYES. BRD'S EYES. Slender, compact, pubescent species 12-18 in. high, densely ascending from a creeping base: lvs. broadly ovate, sometimes narrower, subsessile, crenate or incised, rounded or cordate at base, hairy, thick, $1\frac{1}{2}$ in. long: racemes 3-6 in. long: fls. large, blue, long-pedicelled: caps. longer than broad, widely notched, exceeded by the sepals. May, June. Woods and roadsides, N. and Cent. Eu., Caucasus, Syria, and Canaries. Adventive in this country.—A good border plant.

Subsection 4. SCUTELLATÆ.

32. *pirolæformis*, Franch. Perennial: sts. short, pilose below: lvs. nearly all clustered, petiolate, very broadly ovate, obovate or spatulate, crenate: raceme terminal, solitary, laxly many-fld.: fls. rose or pale violet; calyxlobes glandular, ovate-oblong, obtuse: caps. rhomboid, broader than long. China.

33. *montana*, Linn. MOUNTAIN SPEEDWELL. Slender, trailing, hairy plant, 12-18 in. long, rooting from the st.: lvs. ovate, petioled, coarsely crenate, hairy, sparse: racemes slender, few-fld.: fls. whitish, striped with purple-blue, on long pedicels: caps. large, broader than long, slightly notched, exceeding the hairy sepals. May, June. Moist woods, Temp. Eu.

34. *scutellata*, Linn. (*V. angustifolia*, S. F. Gray, not Bernh.). Perennial, 6-18 in. high, weak, glabrous or rarely puberulent: sts. slender: lvs. sessile, linear-lanceolate, acute, remotely and minutely denticulate: racemes filiform, flexuous, few-fld.: fls. whitish, bluish or flesh-color; calyx-segms. oblong: caps. much wider than long, plano-compressed, 2-lobed. N. temperate regions.—Material offered in the trade as *V. angustifolia* should also be compared with *V. austriaca* and *V. spuria*.

Subsection 5. PETRÆÆ.

35. *Baumgartenii*, Roem. & Schult. (*V. petræa*, Baumg., not Stev.). Perennial, 3-5 in. high, possibly more, glabrous or minutely white-puberulent: sts.

slender, ascending: lowest lvs. minute; middle 6 lines long, ovate or oblong, somewhat dentate; upper lanceolate, narrowed at base: fls. blue; calyx-segms. broadly lanceolate: caps. emarginate, glabrous. S. Hungary.—The material offered in the trade as *V. petræa* may belong here.

36. *petræa*, Stev. Perennial, caespitose, 4-5 in. high, minutely and crisply pubescent: sts. dwarf, diffuse and ascending: lvs. 6-10 lines long, oblong or elliptic from a cuneate, subsessile base, few-toothed; upper lvs. sometimes entire: racemes axillary, solitary; peduncles rather long: fls. large and blue; calyx-segms. broad-oblong: caps. glandular-hirsute, 2-lobed, transversely broader, base rotund, apex retuse. Caucasus.—The material offered in the trade under this name may be *V. Baumgartenii*.

37. *telephifolia*, Vahl. Perennial, creeping or tufted, glabrous, glaucous: branches diffuse, filiform but rather hard and fragile, rooting: lvs. fleshy, bluish green, small, 2-3 lines long, obovate-spatulate or oblong, short-petioled: peduncles axillary, solitary, ending in a short

3915. *Veronica Andersonii* ($\times \frac{1}{2}$). No. 41.

raceme: fls. blue; calyx-segms. elliptic-oblong: caps. glabrous, 2-lobed, transversely broader, base rotundate. Armenia.

38. *Ljallii*, Hook. f. Perennial: sts. slender, prostrate and rooting, 3-18 in. long, diffusely branched; branches terete, usually pubescent: lvs. short-petioled, $\frac{1}{4}$ - $\frac{1}{2}$ in. long, broadly ovate, almost orbicular or oblong-ovate, obtuse or subacute, with 2-3 coarse blunt serratures to a side, thick and coriaceous: racemes several, few or many-fld., near the ends of the branches, sometimes lateral: fls. white with pink veins, $\frac{1}{2}$ in. across; calyx deeply 4-parted, segms. ovate-oblong, ciliate: caps. broadly obovate-oblong, turgid, 2-lobed. New Zeal.

39. *Bidwillii*, Hook. Perennial, about 3 in. high: sts. slender, prostrate and rooting, much branched, woody at base, 3-12 in. long; branches creeping, often matted, glabrous or pubescent: lvs. short-petioled or almost sessile, minute not more than $\frac{1}{4}$ in. long, broadly oblong or ovate with 1 or 2 deep notches on each side or entire, coriaceous: peduncles axillary, slender, erect, 3-9 in. high, few- or many-fld.: fls. white, calyx-segms. 4, ovate or oblong, obtuse: caps. broadly oblong. June. New Zeal.

40. *canescens*, T. Kirk. Perennial, small creeping and rooting herb with intricately branched sts. 1-4 in. long, often forming broad matted patches, hispid with grayish white hairs: lvs. minute, short-petioled or nearly

sessile, obtuse, entire, both surfaces hispid: fls. solitary and axillary, pale blue (rich blue according to the trade); calyx 4-5-parted, segms. linear-oblong; corolla 4-lobed, lobes oblong: caps. small, broadly oblong, slightly compressed. Late-flowering. New Zeal.

Section VII. HEBE.

- A. Lvs. strictly scale-like, connate and appressed. (See also No. 54 which has somewhat scale-like but recurved spreading lvs.)
- B. The lvs. densely imbricated 59. *Hectori*
- BB. The lvs. in distant pairs 60. *cupressoides*
- AA. Lvs. not strictly scale-like and appressed. (No. 54 has somewhat scale-like but recurved spreading lvs.)
- B. Margin of lvs. coarsely serrate. 58. *Hulkeana*
- BB. Margin of lvs. entire or minutely incised.
- C. Blades more than 2 in. long (occasionally less in No. 42).
- D. Apex of lvs. obtuse. 41. *speciosa*
- DD. Apex of lvs. acute or acutish.
- E. Caps. thrice length of calyx. 44. *macrocarpa*
- EE. Caps. twice or less length of calyx.
- F. Fls. $\frac{1}{2}$ in. across. 45. *amabilis*
- FF. Fls. $\frac{1}{8}$ - $\frac{1}{2}$ in. across.
- G. Calyx-segms. narrow-oblong: fls. $\frac{1}{8}$ - $\frac{1}{2}$ in. diam. 42. *macroura*
- GG. Calyx-segms. lanceolate or ovate-lanceolate to ovate-oblong: fls. $\frac{1}{2}$ in. diam. 43. *salicifolia*
- CC. Blades rarely more than 1 in. long.
- D. Shrubs erect, more than 2 ft. high.
- E. Racemes corymbosely branched.
- F. Calyx 3- rarely 4-parted. 46. *diosmifolia*
- FF. Calyx 5-parted. 47. *formosa*
- EE. Racemes simple or even spike.
- F. Lvs. glaucous. 52. *glaucophylla*
- FF. Lvs. green.
- G. The lvs. glossy: fls. in a spike. 51. *buxifolia*
- GG. The lvs. not glossy.
- H. Apex of lvs. obtuse, red-margined. 49. *Balfouriana*
- HH. Apex of lvs. acute.
- I. Fls. $\frac{1}{2}$ in. diam. 48. *elliptica*
- II. Fls. $\frac{1}{4}$ in. diam. 50. *Traversii*
- DD. Shrubs decumbent, less than 1 ft. high.
- E. Lvs. glaucous.
- F. Color of fls. white. 56. *pinguifolia*
- FF. Color of fls. blue. 57. *glaucocærulea*
- EE. Lvs. green.
- F. The blades flat. 53. *chathamica*
- FF. The blades recurved.
- G. Blades broadly obovate oblong. 54. *epacridea*
- GG. Blades ovate-lanceolate. 55. *loganioides*

41. *speciosa*, R. Cunn. Stout half-hardy shrub, 2-5 ft. high, with stout, spreading leafy branches and crimson-purple fls.: lvs. 2-4 in. long, obovate or oblong-oblong, subsessile, dark green, thick, smooth, glossy, entire, rounded at apex: racemes axillary and opposite near tips of branches, stout, dense-fld.: fls. large, $\frac{1}{2}$ in. diam., purple-crimson: caps. more than twice as long as the calyx. Summer. New Zeal. B.M. 4057. F.S. 1:19. R.H. 1844:60. H.U. 6, p. 349. Var. *corymbifera*, Hort., is offered in the trade as growing 2 ft. high with rosy fls. Var. *rubra*, Hort., is offered in the trade. Var. *variegata*, Hort., is offered as a form growing 6 ft. high with large lvs. variegated with creamy white: fls. light blue. Probably really the variegated form of *V. Andersonii*. Intro. into S. Calif.—*V. imperialis*, Hort. (*V. speciosa* var. *imperialis*, Boncharlat), seems to be merely a garden name for the true species. F.S. 22:

2317. *V. speciosa* hybridizes freely and there are several garden hybrids of which the best known is *V. Andersonii*, Lindl. & Paxt. (*V. salicifolia* × *V. speciosa*. *V. speciosa* var. *Andersonii*, Hort. *V. Hendersonii*, Hort.), Fig. 3915, is grown in the greenhouse and is also used as a bedding plant. It grows 18 in. high: lvs. oblong, sessile, entire, thickish: racemes axillary: fls. bluish violet. F.S. 7:658. J.F. 1:103. G.W. 5, p. 20. Var. *variegata*, Hort., has the foliage variegated with creamy white. G.L. 18:77. Gn. W. 23:829.

42. *macrodora*, Hook. f. Shrub, 1-5 ft. high, much branched, glabrous: lvs. sessile or nearly so, 1-3 in., usually more than 2 in. long, obovate-oblong to obovate-lanceolate or linear-oblong, acute, hardly coriaceous, glabrous or nearly so: racemes 2-4 in. long, longer than the lvs., very densely many-fl'd.: fls. small, white or pale bluish white; calyx deeply 4-parted, segms. narrow-oblong, finely pubescent, ciliate: caps. densely crowded, usually pendulous, small, ovate, compressed. New Zeal. G. 37:307.

43. *salicifolia*, Forst. f. A collective species containing many distinct varieties. The most common form is a moderately hardy much-branched shrub attaining at times a height of 10 ft.: lvs. lanceolate, 2-6 in. long, acute, entire or slightly toothed near apex, rather thin, pale green, glabrous: racemes slender, many-fl'd., 3-10 in. long: fls. small, numerous, frequently tinged lilac, sweet-scented: caps. almost twice as long as calyx. Midsummer. New Zeal. B.R. 32:2. Gn. 26, p. 107; 28, p. 293; 34, p. 349. G. 37:308. G.M. 52:258. Gt. 57, p. 189. Var. *Kirkii*, Cheesem. (*V. Kirkii*, J. B. Armstg.). Shrub, 6-12 ft. high; branches stout, dark brown: lvs. smaller, $\frac{3}{4}$ -1 $\frac{1}{2}$ in. long, oblong or oblong lanceolate, leathery: racemes 4-8 in. long: fls. white, $\frac{1}{4}$ in. across: caps. broadly ovate, acute, hoary-pubescent. New Zeal. *V. gigantea*, Cockayne, confined to the Chatham Isls., a tree 40 ft. high, is closely related to *V. salicifolia* but is less hardy. *V. rotundata*, T. Kirk, another allied species, has much broader lvs. and handsome violet-purple fls. There is a fine variegated form of *V. salicifolia* only recently brought into cult. in New Zeal. *V. salicifolia* readily hybridizes with its allies and various hybrids exist but there is no uniformity in their names. *V. carnea*, J. B. Armstg., with rose-colored fls. has probably the above species as a parent.

44. *macrocarpa*, Vahl. A half-hardy species with many forms allied closely to *V. salicifolia* but readily distinguished by the generally narrower, thicker, smoother, darker green lvs., the larger white fls. and the much larger caps., thrice as long as the calyx. Late spring. Frequently in poor clay soil. New Zeal. Gn. 73, p. 7.—*V. latispala*, T. Kirk, is a handsome plant differing from the above in its deep violet fls., broad calyx-lobes and second caps.

45. *amabilis*, Cheesem. Tall shrub related to *V. macrocarpa* but differing in its broader, shorter lvs., laxer racemes and acute calyx-segms. Summer. Near seashore mixed with other shrubs. New Zeal. Var. *blanda*, Cheesem., has shorter lvs. and denser, shorter racemes than the type.

46. *diosmifolia*, R. Cunn. Shrub, usually 2-5 ft. high, but reaching a height of 15 ft.; branches glabrous or puberulous: lvs. short-petioled, $\frac{1}{2}$ -1 in. long, linear-oblong or oblong-lanceolate to elliptic-oblong, acute, entire or minutely incised, coriaceous, dark green above, paler beneath: racemes about 1 in. long, corymbosely

branched: fls. white or pale lavender-blue, about $\frac{1}{4}$ in. across; calyx usually 3-parted, rarely 4-parted; corolla 4-lobed: caps. ovoid, turgid. New Zeal. B.M. 7539. Gn. 43, p. 519.

47. *formosa*, R. Br. Evergreen corymbosely branched shrub, 2-4 ft. high, practically glabrous: lvs. rather crowded, oval-oblong or lanceolate, entire or very rarely obscurely toothed, thick: fls. pale lilac, in short racemes in the upper axils; calyx deeply 5-parted: caps. oblong, acute or obtuse, turgid. July. Tasmania. B.M. 4512. J.F. 1:3.

48. *elliptica*, Forst. f. (*V. decussata*, Ait.). Half-hardy, much-branched shrub, or even small tree, 5-20 ft. high. There are several distinct varieties; the most common in cult. is about 8 ft. high: lvs. petiolate, elliptic-oblong, $\frac{1}{2}$ -1 in. long, apiculate, truncate at base, pale green, rather thick, margins edged with white pubescence, midrib prominent beneath: racemes near tips of branches, short, 1-1 $\frac{1}{2}$ in. long, laxly 4-12-fl'd.: fls. large, blue for a brief period, then white, sweet-scented: caps. twice as long as calyx. Late summer. Seacoast on rock or on ground mixed with other shrubs. Subantarctic S. Amer., Lord Auckland and Campbell Isls. and New Zeal. B.M. 242. J.H. III. 52:38.—*V. Lewisii*, J. B. Armstg., a desirable half-hardy, late-blooming species is related to the above and may be a hybrid. It has larger lvs., dense-fl'd. racemes 2-2 $\frac{1}{2}$ in. long and very large white fls.

49. *Balfouriana*, Hook. f. Erect, glabrous shrub, 3 ft. high: lvs. subsessile, $\frac{1}{8}$ - $\frac{3}{4}$ in. long, elliptic-ovate, subacute or obtuse, margins red-brown: racemes 2-3 in. long, many-fl'd.: fls. pale violet-blue, calyx-segms. acute: caps. one-third longer than calyx-segms. or less. B.M. 7556.—Raised in the Royal Botanic Garden, Edinburgh, from seed sent from New Zeal. but it has not been found growing wild as yet, nor is it cult. in New Zeal.

50. *Traversii*, Hook. f. Fig. 3916. Shrub of dense habit forming a globose mass of leafy, slender sts. 3-4 ft. diam.: lvs. $\frac{1}{2}$ -1 in. long, elliptic-oblong to linear-oblong, green, leathery, acute: racemes near tips of branches, 1-3 in. long, generally tapering: fls. white, calyx-segms. broadly ovate or oblong: caps. twice length of calyx. Midsummer. New Zeal. B.M. 6390. Gn. 32, p. 217; 66, p. 391. G.C. III. 53:172. G. 10:375. G.L. 25:139. G.M. 45:84; 53:630. G.W. 12, p. 161.—*V. monticola*, J. F. Armstg., includes a number of distinct plants much resembling forms of the above, but their lvs. are frequently obtuse and racemes much shorter. Gn. 43, p. 522. *V. laevis*, Benth., is similar to *V. monticola* but it differs in its corymbosely-branched infl. *V. subalpina*, Cockayne, has softer, brighter green lvs., shorter racemes and corolla-tube. It also blooms earlier than *V. Traversii*.

51. *buxifolia*, Benth. Under this name are included many most distinct plants, but all possess green, glossy, acute, thick, petiolate lvs., truncate at the base and keeled beneath, which in one form are golden variegated when young, sessile fls. in spikes $\frac{1}{4}$ -1 in. long and lf.-like bracts as long as or longer than the calyx. Var. *odora*, T. Kirk (var. *patens*, Cheesem.), is perfectly globular in form. Var. *prostrata*, Cockayne, is quite prostrate with rooting branches.—Another form, not yet named, is erect, 2-3 ft. high, and sparingly branched. Late summer. New Zeal. *V. anomala*, J. B. Armstg., distinguished from *V. buxifolia* var. *odora* by its sometimes 3-lobed corolla and its narrower lvs. with purplish tips is nevertheless a most distinct and handsome plant. B.M. 7360.

52. *glaucophylla*, Cockayne (*V. Colensoi* var. *glauca*, Hort.). Closely related to *V. Traversii* but at once distinguished by the small, narrow, not keeled, glaucous lvs., slender tapering racemes of white fls., short corolla-tube hairy within and pubescent ovary. Summer. Dry montane and subalpine stations, New Zeal.

3916. *Veronica Traversii*.
($\times \frac{1}{6}$)

—There are several forms of this striking fairly hardy shrub quite distinct for garden purposes, one of which is known as *V. Colensoi* var. *glauca nana*, Hort. The species is unrelated to *V. Colensoi*, Hook. f., a plant not yet in cult., which has the fls. in corymbs (B.M. 7296).

53. *chathamica*, Buch. A rather tender polymorphic species, the forms of which are distinguished by the trailing habit, flexible branches, elliptic or elliptic-oblong, rather fleshy, pale green, often more or less pubescent lvs. and short, dense, obtuse racemes of violet fls. Late summer. Chatham Isls. G.C. III. 26:354.

54. *epacridea*, Hook. f. Prostrate, almost hardy shrub of straggling habit: lvs. closely quadrifuriously imbricated, opposite pairs united at base, spreading, recurved, $\frac{1}{8}$ – $\frac{1}{4}$ in. long, broadly obovate-oblong, leathery, concave, glabrous, keeled, rounded or subacute at apex: fls. small, white, in dense terminal ovoid heads. Early summer. Mountains, New Zeal. *V. Haastii*, Hook. f., is closely related to the above but is a larger plant with the lvs. more fleshy and not recurved or keeled. Both are admirable rock-garden plants of a most distinct appearance.

55. *loganoides*, J. B. Armstg. Dwarf shrub, 6–14 in. high: sts. woody, decumbent at base, erect above; branches grayish white-pubescent or almost villous: lvs. decussate, sessile, $\frac{1}{8}$ – $\frac{1}{2}$ in. long, ovate-lanceolate, acute, entire or with 1 or 2 small teeth, dull green, keeled, leathery: racemes forming a small corymb-like head: fls. $\frac{1}{4}$ in. across, white or white with pink veins; calyx deeply 4-parted, segms. ovate-oblong, ciliate: caps. elliptical-oblong, didymous, turgid. New Zeal. B.M. 7404.—A species of doubtful systematic position, by some placed in section *Hebe*, by others in what corresponds to section *Chamaedrys*.

56. *pinguifolia*, Hook. f. (*V. carnosula*, Hort., not Hook. f.). Branches stout, more or less decumbent, ringed with lf.-scars: lvs. imbricating to erect-patent, sessile, narrow-oblong to almost orbicular, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, glabrous, usually thick, glaucous, generally margined red: spikes crowded near tips of branches, short, stout, dense-fld.: fls. white, ovary pubescent. Summer. Mountains, to 7,000 ft., New Zeal. B.M. 6587.—A fairly hardy polymorphic species containing many most distinct plants admirably suited for rockeries. The forms with larger almost orbicular lvs. are generally termed *V. carnosula* in gardens, but this species, distinguished by its glabrous ovary and acute caps, is probably not in cult. *V. amplexicaulis*, J. F. Armstg., is an extremely striking allied plant readily distinguished by its far-spreading branches and cordate, semi-amplexicaul lvs. nearly 1 in. long. B.M. 7370. *V. decumbens*, J. B. Armstg., is of similar habit to *V. pinguifolia* but the lvs. are green, though similarly margined red.

57. *glauco-carulea*, J. C. Armstg. Suberect, fairly hardy shrub, about 1 ft. high: lvs. elliptic, acute, $\frac{1}{2}$ in. long, rather thick, intensely glaucous both surfaces, not keeled, margined red: spikes few-fld., rachis strongly pubescent: fls. $\frac{1}{4}$ in. diam., bluish lilac. Midsummer. Dry ground, New Zeal. *V. pimeleoides*, Hook. f., is somewhat similar to the above but is more slender, the lvs. narrower and paler, the spikes longer, the rachis much less hairy and the fls. pale lilac. Var. *minor*, Hook. f., is only 1–4 in. high and its fls. are darker and bluer.

58. *Hulkeana*, F. v. M. Extremely showy, moderately hardy, lilac-fld. species readily distinguished by its shining, coarsely serrate, ovate lvs., 1–2 in. long, and terminal panicles slender, erect, laxly branched, 1–3 ft. high: lvs. in distant pairs, 1–2 in. long, ovate to oblong, obtuse or acute, coarsely serrate, dark green, glossy, rather fleshy: panicle 6–12 in. long by 2–6 in. broad: fls. very numerous, small, sessile, pale soft lilac: caps. small, oblong, twice length of calyx. Rock-faces from the coast-line to 3,000 ft., New Zeal. B.M. 5484. G.C. III. 38:242; 48:444. Gn. 64, p. 115; 77, p. 134. G.M. 47:389; 55:195. R.H. 1906:40. *V. Fairfieldii*,

Hook. f., is said to be a hybrid between the above and *V. Laxaudiana*. It is a smaller, stouter plant with smaller lvs., 1 in. long, the margins crenate-dentate and reddish, and the panicle is shorter and broader. B.M. 7323. Gn.W. 5:709 (as *V. fairfieldensis*). *V. Laxaudiana*, Raoul, is a handsome shrub 6–9 in. high with broadly obovate or obovate-spatulate lvs., their margins crenate-serrate and margined with red and short spikes arranged in a many-fld. corymb 2 in. diam.: fls. pink in the bud but finally white. B.M. 7210. G.C. III. 9:784.

59. *Hectori*, Hook. f. Stout fairly hardy shrub 6–30 in. high: st. terete, closely marked by old lf.-scars: lvs. densely imbricating, opposite pairs united to middle forming a ring surrounding the branch, broadly orbicular-oblong, $\frac{1}{10}$ – $\frac{1}{8}$ in. long, obtuse, smooth, shining, puberulous on margin: fls. crowded at tips of branches, forming small, ovate, terminal heads, small, white. Mountains 3,000–6,000 ft., New Zeal., chiefly in the southwest.—Other allied whipcord veronics are: *V. tetragona*, Hook., branches obtusely 4-angled, lvs. obtuse, keeled; *V. lycopodioides*, Hook. f., branches acutely 4-angled, lvs. narrowed into a blunt point; *V. Armstrongii*, Kirk, branches flabellate, terete, lvs. subacute, fls. pale lilac; *V. salicornioides*, Hook. f., branches terete, lvs. united to much above middle, subtruncate, fls. white. *V. propinqua*, Cheesem. (*V. cupressoides* var. *variabilis*, N. E. Br.), was for many years cult. in gardens under the name of *V. salicornioides* but it is semi-decumbent with slender branches about $\frac{1}{2}$ in. diam. and minute lvs.

60. *cupressoides*, Hook. f. Quite distinct from any other of the whipcord species: a shrub of globose form, 4–6 ft. high: branches numerous, very slender, $\frac{1}{16}$ in. diam., green, clothed with decussate cypress-like scale-like lvs. in distant pairs, much shorter than the internodes and about $\frac{1}{16}$ in. long: fls. in small terminal heads, small, lilac: caps. obovoid. Summer. Mountains, 2,000–3,500 ft., New Zeal. B.M. 7348. G.C. III. 3:20, 21; 9:38.

V. amena, Hort., not Bieb., is described as growing 1 ft. high, flowering early: fls. rosy, in neat spikes. The true *V. amena* is apparently not in cult.—*V. angustifolia* var. *rosea*, Hort., is offered in the trade as shrubby with fls. bright rose in spikes; not determinable botanically as the specific name *angustifolia* has been used for several different forms.—*V. bachofensis*, Hort., is offered in the trade as growing 4 ft. high: fls. dark blue in long slender spikes; possibly the same as *V. Bachofenii*.—*V. Bachoferi*, Hort., is offered as growing 1 ft. high, of close habit with lavender-blue fls.; possibly the same as *V. Bachofenii*.—*V. circæoides*, Don, is offered in the trade, but is not now included in any of the Swiss botanies. The material passing under this name in the trade may be described as follows: Low, trailing perennial, growing in a dense mass: lvs. lanceolate, crenate toward the apex, small, dark green, numerous: racemes many, 6 in. high: fls. small, dark blue. May, June. Considered one of the best. Valuable as a ground-cover, as a rock-plant, or at the front of an herbaceous border.—*V. caelestinum*, Hort., is offered in the trade as very dwarf and spreading, with pale blue fls. Var. *corymbosa*, Hort. ex Don, is a nomen nudum, but material growing less than 9 in. high, with dense glomerate heads of dark blue fls. is offered in the trade under this name.—*V. edinensis*=*V. Hectori*×*V. pimeleoides*.—*V. elegantissima*, Hort., is a trade name.—*V. Forrestii*, Diels. Perennial, 6–15 in. high: sts. decumbent, creeping, branched and stoloniferous at base: lvs. petioled, narrowly ovate or oblong, $\frac{1}{2}$ – $\frac{1}{4}$ in. long, glabrous, paler and often purplish beneath: racemes terminal or axillary: fls. reddish; sepals oblong or lanceolate-oblong, glandular-puberulent; corolla pilose at throat: caps. obliquely rhomboid. Mountains of Yunnan, China.—*V. Girardinoides*, Hort., is a trade name.—*V. Guthrieana*, Hort., is a garden hybrid, said to grow 9 in. high: fls. blue.—*V. herbacea*, Hort., is offered in the trade as having narrow foliage and starry blue fls.—*V. Koentzeri*, Hort., is a trade name.—*V. Lindsayi*, Hort., is offered in the trade as having large trusses of pink fls.—*V. meldensis*, Hort., is a trade name.—*V. myrtifolia*=*V. Balfouriana*×*V. salicifolia*.—*V. Pringlei*, Hort., is offered in the trade as having loose tufts of pale blue fls.—*V. rupestris*, Hort., is probably *V. Teucrium* var. *prostrata*. The name *rupestris* has been used for various forms; that of Salisbury applies to *V. fruticulosa*, that of Tardent to a plant from S. Russia, the description of which is not available.—*V. rupestris* of the trade has axillary, many-fld. racemes. It is a low plant with woody horizontal st. and erect flowering branches 4 or 5 in. high with strict racemes of purplish fls. borne in June and a 4-parted calyx. The caps. is obovate. This plant has been offered by Rochester nurserymen ever since 1894 and was cult. at Harvard Botanic Garden as far back as 1883. Lvs. narrowly oblong, entire or serrate, $\frac{1}{2}$ –1 in. long: calyx-segms. strongly unequal: pedicels longer than calyx: st. pubescent: fls. sparsely ciliate, short-petioled. Gn. 78, p. 161. Var. *alba*, Hort., has white fls. Var. *pallida*,

Hort., is offered as a pretty trailing species with masses of lilac-blue fls.—*V. umbilicata spinosa*, Hort., is a trade name.—*V. utriculata*, Hort., is a trade name.—*V. Veitchii*, Hort., is a horticultural name. G.M. 54:801.—*V. verbenacea*, Hort., is unknown botanically, but has been offered by Rochester nurserymen since 1894 as a form with lvs. short-petioled, narrowly elliptic, serrate in the upper half; racemes lateral: fls. blue.—*V. verbenifolia foliis variegatis*, Hort., is a trade name.—*V. Waldsteinii*, Hort., is offered in the trade as having spikes of blue fls. appearing in very late summer.—*V. Whitallii*, Hort., is offered in the trade as having dense hillocks of dark green foliage and spikes of pale blue fls. F. TRACY HUBBARD.†

VERSCHAFFÉLTIA (Ambroise Verschaffelt, 1825–1886, distinguished Belgian horticulturist; founded L'illustration Horticole at Ghent in 1854 and introduced many choice plants, particularly palms and other foliage plants). *Palmaceæ*, tribe *Arécææ*. A tall palm, spines throughout or at length spineless.

Trunks slender, ringed, arising from above-ground roots: lvs. terminal, recurved; blade oblong or cuneate-obovate, bifid, plicate-nerved, usually lacinate nearly to the rachis; segms. incised; midrib and nerves strong, scaly; petiole half-cylindrical; sheath long, scaly, deeply split: spadix 3–6 ft. long, paniculately branched, long-peduncled, recurved, scaly, its rachis long, and branches and branchlets spreading, slender: spathes 2 or 3, long, sheathing, the lower persistent, the upper deciduous: fls. very small: fr. globose, smooth, 1 in. long.—A genus of only 1 species from the Seychelles. Cult. as in *Latania*.

spléndida, H. Wendl. Caudex 80 ft. high, 6–12 in. diam., very spiny when young, with many aerial roots: lvs. 5–8 ft. long; petiole 6–12 in. long, pale green; sheath $2\frac{1}{2}$ – $3\frac{1}{2}$ ft. long, white-granular; blade cuneate-obovate, bright green, 4–7 ft. long, 3–5 ft. wide, bifid, deeply incised on the edges. I.H. 12:430; 43, p. 31. F.R. 2:483. R.H. 1869, p. 148. A.G. 22:649.

V. melanochaetes, H. Wendl.—*Roscheria*.

WILHELM MILLER.

VERVAIN: *Verbena*.

VESICÀRIA (Latin, bladder, referring to the shape of the pods). *Cruciferae*. Branched annual or perennial herbs, treated as annuals in the garden: lvs. entire, sinuate or pinnatifid: racemes without bracts: fls. large, rarely small, yellow or purple, variable in form; sepals similar at base or the lateral somewhat saccate: silique globose or inflated, 1–2-celled, many-seeded, valves swollen.—About 20 species, widely distributed. The annual species are prop. by seeds, the perennial by division.

sinuata, Poir. Lvs. softly tomentose, oblong-lanceolate, narrowed toward the base, sinuate-dentate or subentire. Spain.—According to DeCandolle the petals finally become whitish. Both seeds and plants of *V. sinuata* are offered by American dealers, but the plant is not generally known. DeCandolle says it is an annual or biennial, while Koch says it is perennial or subshrubby. In the American trade it is considered an early-flowering yellow annual, about 1 ft. high, blooming in May and June.

F. TRACY HUBBARD.†

VETCH: *Vicia*. **V.**, Crown: *Coronilla*. **V.**, Milk: *Astragalus*.

VETIVERIA (*Vetiver*, the Tamil vernacular name). *Gramineæ*. Aromatic perennials with long panicles of numerous slender racemes: spikelets awless, in pairs, one sessile and perfect, the other pedicelled and staminate, the sessile spikelet bearing minute spines.—Species 1, with 1 or 2 varieties. *V. zizanioides*, Nash (*Andropogon squarrosus*, of authors, not Linn. *A. muricatus*, Retz. *V. arundinacea*, Griseb.). Fig. 3917. E. Indies, escaped from cult. in the American tropics and in the S. U. S. The rhizome is very aromatic. This is the Khas Khas or Khus Khus grass of India, the vitivert used in perfumery and the *Radix Anatheri* or *R. Vetiveræ* of the apothecaries. It has been used in medicines and perfumes from prehistoric times. In India the plant is used to make screens, called "Ves-

saries," which, when kept wet and placed in a current of air, cools and perfumes the atmosphere. The rhizome when laid away among them is said to keep clothing free from moths. For history of this grass, see Kew Bull. Misc. Inform. No. 8, 1906. A. S. HITCHCOCK.

VIBURNUM (the ancient Latin name). *Caprifoliaceæ*. Ornamental woody plants grown for their attractive flowers, fruits, and foliage.

Deciduous or sometimes evergreen shrubs, rarely small trees, with opposite stipulate or exstipulate lvs.:

fls. small, in terminal panicate or mostly umbel-like cymes; calyx with 5 minute teeth; corolla rotate or campanulate, rarely tubular; stamens 5; ovary usually 1-loculed: fr. a drupe with a 1-seeded, usually compressed stone. In several species the marginal fls. of the cymes are sterile and radiate; such are *V. macrocephalum*, *V. tomentosum*, *V. Opulus*, *V. americanum*, *V. Sargentii*, and *V. alnifolium*, and of the 3 first-named garden forms are known with all fls. sterile and enlarged.—About 120 species in N. and Cent. Amer. and in the Old World from Eu. and N. Afr. to E. Asia, distributed as far south as Java. For a key to the 65 species known from E. Asia, see Rehder, The Viburnums of Eastern Asia, in Sargent, Trees and Shrubs, 2:105–116.

The viburnums are upright mostly rather large shrubs or sometimes small trees with usually medium-sized deciduous or evergreen foliage and white or sometimes pinkish flowers in showy flat clusters or sometimes in panicles, followed by berry-like subglobose to oblong, red, dark blue, or black fruits. The viburnums rank among the most valuable ornamental shrubs. Besides showy flowers and decorative fruits they possess handsome foliage which mostly assumes a bright fall coloring. The plants are of good compact habit. Most of the deciduous species are hardy North, but *V. macrocephalum* var. *sterile* and *V. obovatum* are tender;

3917. *Vetiveria zizanioides*. ($\times\frac{1}{2}$)

also *V. tomentosum*, *V. Wrightii*, *V. theiferum*, *V. cotinifolium*, *V. nudum*, and *V. dilatatum* are not quite hardy farther north than New England. Of the evergreen species, *V. rhytidophyllum* is the hardiest and at the same time one of the most distinct and handsomest species of the genus, with its bold foliage and the large clusters of flowers and fruits; it is hardy as far north as Massachusetts in favorable positions; also *V. japonicum* stands several degrees of frost, but cannot be relied on north of Philadelphia; *V. odoratissimum* and *V. suspensum* are still tenderer. The viburnums are well suited for borders of shrubberies or planting along roads, and the more showy ones are handsome as single specimens on the lawn. They are mostly medium-sized shrubs, 5–10 feet high, but *V. Lentago*, *V. prunifolium*, and *V. rufidulum* sometimes grow into small trees, 30 feet high, while *V. acerifolium* hardly reaches 5 feet. The most decorative in fruit are *V. Opulus*, *V. dilatatum*, and *V. Wrightii*, with scarlet or red berries which remain a long time on the branches. Besides the snowball forms, *V. dilatatum*, *V. tomentosum*, *V. Sieboldii*, *V. prunifolium*, *V. rufidulum*, *V. venosum*, and *V. denta-*

are very handsome in bloom. Varieties with all the flowers of the cymes sterile and enlarged are known in the case of *V. Opulus*, *V. tomentosum*, and *V. macrocephalum*, the common, the Japanese and the Chinese snowballs; all these are very showy. One of the most charming in bloom is *V. Carlesii* on account of its rather large pink-and-white and deliciously fragrant flowers which appear in dense clusters early in spring before or with the leaves; almost all other species bloom after the leaves. The foliage of most species turns purple or red in fall, that of *V. Opulus*, *V. americanum*, and *V. acerifolium* being especially brilliant. *V. dilatatum* assumes a dull yellow color. *V. macrocephalum* and *V. Sieboldii* keep the bright green of their foliage until late in autumn. The viburnums are not very particular as to soil and position, but most of them prefer a rather moist and sunny situation. Some, as *V. acerifolium*, *V. Lantana*, *V. dilatatum*, *V. Tinus*, *V. pubescens*, and *V. prunifolium*, grow well in drier places, while *V. alnifolium* and *V. pauciflorum* require shade and a porous soil of constant moisture. *V. acerifolium* does well under the shade of trees in rocky and rather dry soil. *V. Tinus* is often grown in pots and thrives in any good loamy and sandy soil. With a little heat it may be forced into bloom at any time in the winter; if not intended for forcing, it requires during the winter a temperature only a little above the freezing-point and even an occasional slight frost will not hurt it. The common and the Japanese snowball are also sometimes forced and require the same treatment in forcing as other hardy shrubs.

Propagation is by seeds sown in fall or stratified; also by greenwood cuttings under glass, especially *V. tomentosum*, *V. macrocephalum*, *V. venosum*, *V. cassinoides*, and the evergreen species; *V. dentatum* and *V. Opulus* and its allies grow readily from hardwood cuttings and all species can be increased by layers; grafting is also sometimes practised, and *V. Opulus*, *V. dentatum*, and *V. Lantana* are used as stock.

3918. *Viburnum Sieboldii*. ($\times \frac{1}{2}$)

The familiar snowball is seriously attacked by aphids. Fortunately its place can be taken by a Japanese species that is even more satisfactory. (Fig. 3923.) The berries of its fertile type, *V. tomentosum*, are a brilliant scarlet, changing to black. The foliage of this snowball is also remarkably beautiful. The leaves are olive-green with brownish purple or bronzy margins, and their plicate character makes them very distinct and attractive. The bush is entirely free from insect

pests. The single and double forms of the Japanese species differ as shown in Figs. 3922 and 3923. Unfortunately these "single" and "double" forms have been confused in many nurseries, and only the trained eye can tell them apart in the nursery row. The double or snowball type is, of course, the one destined to the greater popularity, though the single form is a shrub of great value, especially for large estates and parks. The double form is known to nurseries as *V. plicatum*, but its proper name is *V. tomentosum* var. *plenum*. While it is hardy in New England, it is not a shrub that can be transplanted as easily as many other species. Hence it should be transplanted every second year in the nursery until it is sold. The double form may be propagated by cuttings of half-ripened wood in close frames, or by layers, which in some soils would better remain two years. French nurserymen propagate it by layering. The layers seem to suffer from winter and, to be on the safe side, it is best to cover them well with moss or leaves when the ground is somewhat frozen, so that the frost may be kept in until spring. The clusters are about as big as oranges and pure white. They are in great demand for Decoration Day in New York. The single form, unlike the double, is easily transplanted. It is also readily propagated by layers or cuttings. Both kinds are hardy in the North and make compact bushes 6 to 8 feet high.

KEY TO THE SPECIES.

- A. *Lvs. penninerved, not lobed.*
- B. *Cymes paniculate, broadly pyramidal or semi-globose.*
- C. *Foliage deciduous.* 1. *Sieboldii*
- CC. *Foliage evergreen.*
- D. *Corolla with cylindrical tube.* 2. *suspensum*
- DD. *Corolla rotate-campanulate.* 3. *odoratissimum*
- BB. *Cymes umbel-like, flat (except in the snowball forms. See Nos. 12, 16, 28.)*
- C. *Secondary veins curving and anastomosing before reaching the margin: margin entire or finely serrate.*
- D. *Branches and lvs. glabrous, hirsute, or scurfy.*
- E. *Foliage persistent, entire.*
- F. *Branches and lvs. glabrous or slightly pubescent.* 4. *Tinus*
- FF. *Branches and lvs. hirsute.* 5. *rigidum*
- EE. *Foliage deciduous or half-evergreen.*
- F. *Lvs. entire or slightly undulate-dentate.*
- G. *Cymes sessile: lvs. small.* 6. *obovatum*
- GG. *Cymes peduncled.*

- H. Peduncle as long or longer than cyme: lvs. usually entire. . . 7. nudum
- HH. Peduncle shorter than the cyme: lvs. remotely denticulate. . . 8. cassinoides
- FF. Lvs. finely and sharply serrate: cymes sessile, subtended by the upper lvs.
- G. Petioles mostly with wavy, rather broad margin. 9. Lentago
- GG. Petioles without or with narrow, not wavy margin.
- H. Winter buds and petioles rusty-pubescent. 10. rufidulum
- HH. Winter buds and petioles not rusty-pubescent. 11. prunifolium
- DD. Branches and lvs. stellate-pubescent: winter buds naked.
- E. Lvs. deciduous, dull green above: marginal or all fls. sterile. 12. macrocephalum
- EE. Lvs. persistent, lustrous and wrinkled above, 3-7 in. long: fls. all fertile. . . . 13. rhytidophyllum
- CC. Secondary veins prominent, ending in the points of the teeth.
- D. Winter buds naked: lvs. with usually numerous small teeth.
- E. Corolla with cylindric tube, fragrant. 14. Carlesii
- EE. Corolla rotate campanulate.
- F. Cymes with all the fls. fertile.
- G. Rays of cymes usually 7: cymes flat. 15. Lantana
- GG. Rays of cymes usually 5: cymes somewhat convex. 16. cotinifolium
- FF. Cymes with the marginal fls. sterile and enlarged. . 17. alnifolium
- DD. Winter buds protected by scales: teeth rather coarse, usually less than 25 on each side.
- E. Petioles without stipules.
- F. Cymes with the marginal fls. sterile and enlarged. . 18. tomentosum
- FF. Cymes with all fls. fertile and alike.
- G. Fr. red: lvs. rounded or broadly cuneate at the base.
- H. Foliage evergreen, glabrous. 19. japonicum
- HH. Foliage deciduous.
- I. Lvs. 3-nerved at the base, with 3-4 pairs of veins. . . . 20. foetidum
- II. Lvs. penninerved with 5 or more pairs of veins.
- J. Both surfaces of lvs. pubescent. . . 21. dilatatum
- JJ. Both surfaces of lvs. glabrous or nearly so.
- K. Lvs. broadly obovate or broadly ovate: stamens usually longer than the corolla. . . . 22. Wrightii
- KK. Lvs. oblong-ovate: stamens usually shorter than corolla. . . . 23. theiferum
- GG. Fr. bluish black: lvs. cordate or rounded at the base.
- H. Branches and lvs. glabrous. 24. dentatum

- HH. Branches and lvs. beneath pubescent.
- I. Infl. slightly pubescent: lvs. with 6-8 pairs of prominent veins. . . . 25. venosum
- II. Infl. densely pubescent: lvs. with 4-6 pairs of veins. . . . 26. scabrellum
- EE. Petioles with stipules.
- F. Bark exfoliating: lvs. broadly ovate, 3-5 in. long, long-petioled. . . . 27. molle
- FF. Bark close: lvs. ovate, 1½-3 in. long, usually short-petioled. 28. pubescens
- AA. Lvs. palmately 3-5-nerved, usually 3-lobed, slender-petioled.
- B. Fls. all perfect.
- C. Habit strictly upright: fr. purplish black. 29. acerifolium
- CC. Habit straggling: fr. scarlet. . . . 30. pauciflorum
- BB. Fls. marginal, sterile, radiant.
- C. Anthers yellow: bark of sts. thin.
- D. Petiole with a narrow groove and large disk-like glands: lvs. pubescent beneath. . . . 31. Opulus
- DD. Petiole with a broad shallow groove and small glands: lvs. glabrous beneath. . . . 32. americanum
- CC. Anthers purple, rarely yellow: bark of sts. thick, corky: the upper lvs. with elongated and usually entire middle lobe. . . 33. Sargentii

1. *Siëboldii*, Miq. Fig. 3918. Deciduous shrub, attaining 10 ft., with stout branches, pubescent when young: lvs. oval to oblong-obovate, coarsely crenate-serrate except toward the base, acute, dark green and shining above, paler and stellate-pubescent beneath, 3-6 in. long: fls. white, rotate-campanulate, in panicles 2½-4 in. broad: fr. oblong, changing from pink to bluish black. May, June. Japan. G.F. 2:559 (adapted in Fig. 3918). S.I.F. 1:86. F.E. 23:345.—Hardy shrub of vigorous growth with handsome dark green foliage, large for the genus, exhaling a disagreeable odor when bruised. The frs. drop soon after ripening. It is known in some nurseries as *V. japonicum*, *V. latifolium*, or *V. japonicum latifolium*. Var. *reticulatum*, Rehd. (*V. reticulatum*, Hort.). Smaller in every part: lvs. of lighter green, less pubescent: half-hardy. Var. *variegatum*, Hort. Lvs. variegated with white.

2. *suspensum*, Lindl. (*V. Sandánkwa*, Hassk.). Evergreen shrub, attaining 6 ft., with slender warty branches: lvs. oval to oval-oblong, acute or obtusish, usually remotely crenate-serrate toward the apex, shining and dark green above, paler beneath, glabrous, 2-4 in. long: fls. white, tinged pink, in dense semi-globose panicles becoming 1½ in. high; corolla ½ in. long, with cylindric tube twice as long as limb: fr. red, subglobose. June, July. Liu-kiu Isl. B.M. 6172.—Tender.

3. *odoratissimum*, Ker (*V. Awabücki* and *V. Awafüki*, Hort.). Evergreen upright shrub, attaining 10 ft., with stout warty branches, glabrous: lvs. elliptic to elliptic-oblong, acute, remotely serrate toward the apex or entire, shining and bright green above, paler beneath, glabrous, 3-6 in. long: fls. pure white, fragrant, in broadly pyramidal panicles 4 in. high; corolla rotate-campanulate: fr. red, changing to black. May, June. India to S. China and Japan. B.R. 456. S.I.F. 1:88.—Tender.

4. *Tinus*, Linn. (*V. Laurustinus*, Hort. *Tinus laurifolius*, Borkh.). *LAURUSTINUS* (or *LAURESTINUS*). Bushy, 10 ft., with glabrous or somewhat hairy branches: lvs. ovate-oblong or oblong, acute, dark green, shining and glabrous above, pubescent beneath usually only on the veins, 2-3 in. long: fls. white or pinkish white, slightly fragrant: cymes somewhat convex, 2-3 in. broad: fr. ovoid, black, rather dry. May—

CXVI. *Viburnum tomentosum*.

Aug., or in the greenhouse in early spring and winter. Medit. region. B.M. 38. Gn. 70, p. 113; 77, p. 601. Gn. W. 18:297.—Handsome free-flowering shrub, often cult. as a pot-plant N. Var. *Froëbelii*, Nichols. Compact form with light green lvs. and pure white fls. Var. *hirtum*, Ait. Lvs. pubescent beneath and ciliate. Var. *lucidum*, Ait. (*V. lucidum*, Mill. *V. grandiflorum*, Hort.). Lvs. and cymes larger, more tender and not adapted for forcing. Gn. 15, p. 196. Gt. 5:192. Var. *purpureum*, Hort. Lvs. suffused with a dull purple tinge. Var. *strictum*, Loud., not Ait. Of erect and fastigiate habit. Var. *virgatum*, Ait. Lvs. oblong-lanceolate, pubescent on the margin and on the veins beneath. Var. *variegatum*, Hort. Lvs. variegated.

5. *rigidum*, Vent. (*V. rugosum*, Pers. *V. latifolium*, Hort. *V. Tinus* var. *strictum*, Ait.). Shrub, attaining 6 ft., with spreading hirsute branches: lvs. broadly ovate to ovate-oblong, acute or obtusish, pubescent on both sides when young, almost glabrous above at length and wrinkled, 3-6 in. long; fls. pure white: cymes large, 3-4 in. broad: fr. oval, bluish black. May-July. Canary Is. B.R. 376. L.B.C. 9:859. B.M. 2082. A.G. 14:456.—Less handsome and less free-flowering than the preceding species.

6. *obovatum*, Walt. (*V. laevigatum*, Ait.). Shrub, attaining 8 ft., with spreading branches: lvs. almost sessile, obovate to oblanceolate, obtuse or retuse, coriaceous, glossy, entire or obscurely crenate toward the apex, $\frac{1}{2}$ -1 $\frac{1}{2}$ in. long: fls. white, in sessile cymes 1-2 in. broad: fr. oval, black. April-June. Va. to Fla. L.B.C. 15:1496.—Tender.

7. *nudum*, Linn. (*V. nudum* var. *Claytonii*, Torr. & Gray). Upright shrub, sometimes attaining 15 ft.: lvs. oval to obovate or oval-lanceolate, acute or obtuse, usually entire and somewhat revolute or obscurely crenulate, thickish, scurfy on both sides when young, gla-

Hort.). Lvs. smaller and narrower, more shining above and firmer.

8. *cassinoides*, Linn. (*V. nudum* var. *cassinoides*, Torr. & Gray. *V. squamatum*, Willd.). WITHE-ROD. APPALACHIAN TEA. Fig. 3919. Upright shrub, 2-6, occasionally 12 ft. high: lvs. oval to ovate to oblong, acute or bluntly acuminate, usually obscurely dentate, almost glabrous, rather thick, dull green above, 1-3 in. long: fls. and fr. almost like those of the preceding species, but peduncle shorter, usually shorter than cyme; blooming a little earlier. June, July. Newfoundland to Man. and Minn., south to N. C. G.F. 9:305 (adapted in Fig. 3919). M. D. G. 1904:85, 86. Em. 2:411 (as *V. nudum*).—A good shrub for borders of shrubberies; hardy.

3920. *Viburnum Lentago*. ($\times \frac{1}{2}$)

9. *Lentago*, Linn. SHEEP-BERRY. NANNY-BERRY. Fig. 3920. Shrub or small tree, attaining 30 ft., with slender branches: winter buds long-pointed: petioles mostly with wavy margin: lvs. ovate, acuminate, glabrous or scurfy at the veins beneath, 2-4 in. long: fls. white: cymes sessile, 2-5 in. broad: fr. oval, bluish black, with bloom. May, June. Hudson Bay to Man., south to Ga. and Miss. S.S. 5:223, 224.—Hardy, large, often arborescent shrub, keeping its lvs. until spring. Sometimes as *V. prunifolium* and *V. pyriforme* in gardens. A garden hybrid, originated in Germany, is *V. Vetteri*, Zabel (*V. Lentago* $\times$ *V. nudum*), similar in habit to this species but the cymes on short peduncles over $\frac{1}{2}$ in. long.

10. *rufidulum*, Raf. (*V. prunifolium* var. *ferrugineum*, Torr. & Gray. *V. ferrugineum* and *V. rufotomentosum*, Small). Large shrub or small tree, attaining 25 ft. or more, with rather stout branches: winter buds scarcely pointed, obtuse, rusty-pubescent: petioles often with narrow margin, rusty-tomentose: lvs. elliptic to obovate, usually obtuse, glabrous and shining above, rusty-pubescent on the veins beneath, 2-4 in. long: fls. pure white: cymes 3-5 in. broad: fr. oval, dark blue, glaucous, $\frac{1}{2}$ in. long. April-June, later than the following species. Va. to Fla., west to Ill. and Texas. S.S. 5:225 (as *V. prunifolium*, partly).—Handsome arborescent shrub with dark green shining foliage, showy fls. and decorative fr.; has proved hardy at the Arnold Arboretum, Boston.

11. *prunifolium*, Linn. (*V. pyriforme*, Poir.). BLACK HAW. STAG-BUSH. Shrub or small tree, attaining 15 ft., with spreading, rather stout branches: winter buds short-pointed, glabrous or reddish, pubescent: lvs. broadly oval to ovate, acute, or obtuse, glabrous or nearly so, 1-3 in. long; petioles often with narrow margin, glabrous: fls. pure white: cymes sessile, 2-4 in. broad: fr. oval to subglobose, bluish black and glaucous, little over $\frac{1}{2}$ in. long. April-June. Conn. to Fla., west to Mich. and Texas. A.F. 12:1100. Gng. 5:310. M.D.G. 1901:628. F.E. 17:701.

12. *macrocephalum*, Fortune. Shrub, attaining 12 ft. and occasionally more, with spreading branches: lvs. short-petioled, oval to ovate-oblong, rounded at base, acute, denticulate, almost glabrous and dark green above, stellate-pubescent beneath, 2-4 in. long: fls. yellowish white, in peduncled cymes, 3-5 in. across, with the mar-

3919. *Viburnum cassinoides*. ($\times \frac{1}{2}$)

brous above at length: fls. white or yellowish white: cymes rather long-peduncled, 3-5 in. broad: fr. globose, pink at first, changing to dark blue. June, July. Long Island to Fla., west to Ky. and La. B.M. 2281.—Not quite hardy N. Var. *nitidum*, Zabel (var. *angustifolium*, Torr. & Gray. *V. nitidum*, Ait. *V. anglicum*,

ginal fls. sterile and radiant. May, June. China. Gn. 79, p. 336. Var. *Keteleëri*, Nichols. (*V. Keteleëri*, Carr.). The wild form with only the marginal fls. sterile and enlarged; has proved hardy at the Arnold Arboretum. R.H. 1863, p. 270. Gn. 45, p. 423. Var. *stérile*, Dipp. (*V. Fortunei*, Hort.). CHINESE SNOWBALL. All the fls. sterile, forming a subglobose ball, sometimes 7 or 8 in. across. B.R. 33:43. F.S. 3:263, 264. R.H. 1858, p. 350. Gn. 34, p. 348; 45, p. 422; 56, p. 82; 71, p. 142. G.C. III. 25: suppl. June 3; 30:332. F.S.R. 2, p. 205. A.F. 16:1547. G. 1:61; 35:381 (as *V. macrophyllum*). A very showy variety, but less hardy than the type.

13. *rhytidophyllum*, Hemsl. Evergreen shrub, to 10 ft., with stout upright branches; branchlets densely stellate-tomentose; lvs. thick, ovate-oblong to oblong-lanceolate, acute or obtuse, rounded or subcordate at the base, dark green, glabrous and lustrous and deeply wrinkled above, covered with a thick gray or yellowish tomentum beneath and reticulate, entire or indistinctly denticulate, 3-7½ in. long; fls. yellowish white, ¼ in. across, in terminal cymes 4-8 in. across formed in autumn and expanding the following spring: fr. ovoid, ½ in. long, first red, finally changing to shining black. May, June; fr. in Sept., Oct. Cent. and W. China. B.M. 8382. S.T.S. 2:118. G.C. III. 39:418; 42:220. Gn. 78, p. 283. J.H.S. 28:63; 33:187 (fig. 103). R.H. 1911, p. 229. M.D.G. 1912:29. M.D. 1912:201. G. 32:63, 645; 37:228.—One of the most striking viburnums on account of its large evergreen foliage; particularly handsome in autumn with its large clusters of fr. changing from red to shining black. It has proved fairly hardy at the Arnold Arboretum, and in W. N. Y., though the lvs. suffer more or less in exposed situations.

14. *Cárlesii*, Hemsl. Much-branched spreading shrub, to 4 ft.: young branchlets stellate-tomentose; lvs. broadly ovate or oval, acute, usually rounded at the base, irregularly toothed, dull green and pubescent above, pale and stellate-tomentose beneath, 1-3½ in. long; petiole ¼-½ in. long; fls. salver-shaped, about ½ in. long and the limb about as much across, changing from pinkish to white, fragrant, in dense terminal subglobose cymes 2-3 in. across, appearing with the lvs.; stamens included, inserted about the middle; filaments shorter than anthers. April, May. Korea. B.M. 8114. G.C. III. 32:261; 43:346; 45:340. Gn. 62, p. 168; 69, p. 279; 72, p. 242; 78, p. 413. G. 30:223. F.E. 31:332.

3921. *Viburnum alnifolium*. ($\times \frac{1}{2}$)

J.H. III. 64:126. R.B. 33, p. 356. M.D.G. 1902:271; 1907:380; 1912:493. M.D. 1912, p. 196.—One of the most charming viburnums, opening its deliciously fragrant pink-and-white fls. early in spring with the unfolding lvs.; it has proved hardy at the Arnold Arboretum. A closely related species which has been

3922. *Viburnum tomentosum*. ($\times \frac{1}{2}$)

confused with *V. Carlesii* is *V. bitchuiense*, Makino. A slenderer, more straggling shrub; lvs. smaller, usually obtuse and often subcordate; fls. in smaller cymes; anthers inserted near the base; filaments longer than anthers. Japan. Less handsome than *V. Carlesii*.

15. *Lantana*, Linn. WAYFARING TREE. Upright shrub or sometimes small tree, attaining 20 ft.: young branches scurfy-pubescent; lvs. ovate or oblong-ovate, usually cordate at base, acute or obtuse, sparingly stellate-pubescent and wrinkled above, tomentose beneath, denticulate, 2-4 in. long; fls. white; cymes dense, 2-3 in. broad, with usually 7 rays: fr. ovoid-oblong, bright red, changing to almost black. May, June. Eu., W. Asia. A.G. 18:453 and F.E. 9:593 (as *V. lantanoides*). H.W. 3, p. 131. Gn. 61, p. 324.—Hardy shrub, especially for drier situations and limestone soil. Var. *rugosum*, Hort. With larger and very wrinkled lvs. and larger cymes. There are a number of other varieties, including some with variegated lvs.

16. *cotinifolium*, D. Don (*V. multratum*, C. Koch). Shrub, attaining 6 ft., with spreading branches, tomentose when young; lvs. orbicular-ovate to ovate, cordate or rounded at the base, usually obtuse, crenulate-dentate or almost entire, wrinkled above and nearly glabrous at length, tomentose beneath, 2-5 in. long; fls. white, tinged with pink, in cymes 2-3 in. broad, with usually 5 rays; corolla rather larger, funnelform-campanulate, tube longer than limbs: fr. ovoid-oblong, red, changing to black. May, June. N. W. Himalayas. B.R. 1650. G.F. 5:245. G.W. 13, p. 141. G. 37:229.—Not quite hardy N., requiring protection near Boston.

17. *alnifolium*, Marsh. (*V. lantanoides*, Michx.). HOBBLE-BUSH. AMERICAN WAYFARING TREE. Fig. 3921. Low shrub, sometimes 10 ft. high, with wide-spreading, often procumbent branches, scurfy-pubescent when young; lvs. orbicular or broadly ovate, cordate at the base, short-acuminate or acute, irregularly serrulate, minutely pubescent or almost glabrous

above, scurfy pubescent beneath, 3-8 in. broad: fls. white: cymes sessile, 3-5 in. broad; marginal fls. enlarged and sterile, long-pedicelled: fr. ovoid-oblong, dark purple. May, June. New Bruns. and Mich. to N. C. G.F. 2:535 (adapted in Fig. 3921).—Handsomeness shrub, with very large foliage, assuming a deep claret-red in fall. Var. *præcox*, Hesse. Said to bloom about 3 weeks earlier than the type. M.D. 1912, p. 370. G.W. 16, p. 495.

18. *tomentosum*, Thunb. (*V. plicatum*, Miq.). Fig. 3922. Strong-growing shrub, attaining 8 ft., with spreading branches, tomentose when young: lvs. broadly ovate to oblong-ovate, sometimes obovate, acute or abruptly acuminate, dentate-serrate, dark green and almost glabrous above, stellate-pubescent beneath, sometimes only on the veins, $1\frac{1}{2}$ -4 in. long: cymes 2-3 in. broad, long-peduncled; sterile fls. long-pedicelled: fr. ovoid, red, changing to bluish black. June. China, Japan. S.Z. 1:38. S.I.F. 1:86. G.C. III. 36:234. G. 25:424; 26:265. R.H. 1910, pp. 382, 383. Gt. 54, p. 114. G.W. 3, p. 287. G.F. 4:594 (adapted in Fig. 3922), 595. A.F. 12:1101. F.E. 18:461. Gng. 5:311. M.D.G. 1898:400. S.H. 2:502.—A beautiful hardy shrub, with handsome foliage and showy fls.; the frs. too, are decorative, especially before they change to black. In some nurseries erroneously named *V. japonicum*. Var. *parvifolium*, Rehd. (*V. tomentosum* var. *cuspidatum*, Maxim. *V. plicatum* var. *parvifolium*, Miq.). Lvs. elliptic to oblong, abruptly long-acuminate, 1-2 in. long. Of slow growth and blooming sparingly. Var. *lanceatum*, Rehd. Similar to the preceding variety, but lvs. narrower, lanceolate on the shoots, and gradually acuminate, more pubescent beneath: infl. smaller with fewer sterile fls. Var. *Mariësi*, Veitch. Differs little or not at all from the type. J.H.S. 27, p. 863 (fig. 195). G. 33:493, 631; 37:227. R.B. 30, p. 186. Var. *plenum*, Rehd. (*V. plicatum* var. *plenum*, Miq. *V. tomentosum* var. *plenum*, Maxim. *V. plicatum*, Thunb.). JAPANESE SNOWBALL. Fig. 3923. All fls. sterile, forming large, globose balls $2\frac{1}{2}$ -3 in. across. G.C. III. 29:72; 30:321. Gn. 59, p. 113; 61, p. 261; 70, p. 27; 71, pp. 163, 319; 73, p. 7; 75, p. 347; 78, pp. 427, 472. G. 21:287. F.E. 18:677. F.S. 3:278. B.R. 33:51. A.G. 18:357. Gng. 1:263. V. 6:294. M.D.G. 1898:401. S.H. 2:503, 505. Var. *rotundifolium*, Hort. Much like the preceding variety, but lvs. broader and blooming about 2 weeks earlier. There is also a variegated form. F.E. 31:715.

19. *japonicum*, Spreng. (*V. macrophyllum*, Blume). Evergreen upright shrub, to 6 ft., with glabrous branches: lvs. broadly or rhombic-ovate to oblong-ovate, acute or shortly acuminate, remotely dentate except at the base, 3-6 in. long: fls. in short-peduncled, glabrous cymes 2-4 in. broad: fr. globose, red. June. Japan.—Handsomeness large-lyd. shrub, but not hardy N.

20. *fetidum*, Wall. (*V. ceanothoides*, C. W. Wright). Upright shrub with spreading branches, to 10 ft.: branchlets stellate-pubescent: lvs. obovate to rhombic- or obovate-oblong, acute or acutish, rarely short-acuminate, cuneate at the base, sinuately toothed above the middle, 3-nerved at the base and with 1 or 2 pairs more of lateral veins, glabrous above, pubescent on the veins beneath, 1-2½ in. long; petiole $\frac{1}{4}$ -½ in. long: fls. white, in cymes 2-4 in. across on lateral spreading branchlets: fr. scarlet, ovoid, ½ in. long. June. Himalayas, S. W. China. Var. *rectangulum*, Rehd. (*V. rectangulum*, Graebn.). Shrub, to 12 ft., with spreading, often pendulous branches: lvs. oblong-obovate to lanceolate, acuminate, remotely dentate or denticulate, usually nearly glabrous, 1½-3 in. long: cymes on slender, lateral branchlets often spreading at right angles. W. China.

21. *dilatatum*, Thunb. Fig. 3924. Upright bushy shrub, attaining 10 ft., with the branches hirsute when young: lvs. roundish or broadly ovate or obovate, usu-

ally abruptly short-pointed, coarsely toothed, pubescent on both sides, 2-5 in. long: fls. pure white, in short-stalked cymes, 3-6 in. broad; corolla pubescent outside: fr. ovate, scarlet, ½ in. long. May, June. China, Japan. B.M. 6215. S.I.F. 1:87. G.F. 4:150 (adapted in Fig. 3924). M.D.G. 1899:241, 242. A.F. 15:123.—Handsomeness hardy free-flowering shrub, especially decorative with its numerous scarlet frs. remaining a long time on the branches.

22. *Wrightii*, Miq. Upright shrub, to 10 ft. high, with the branches almost glabrous: lvs. almost orbicular or broadly obovate to ovate, abruptly acuminate, coarsely dentate, almost glabrous except on the veins beneath, 3-5 in. long: fls. rather large, white, in usually short-stalked, 2-4 in.-broad cymes; corolla glabrous outside; stamens longer than the corolla: fr. globose, red. May, June. Japan. S.T.S. 1:19.—Hardy shrub, similar to the preceding, but of less dense habit, with larger frs.

3923. *Viburnum tomentosum* var. *plenum*.—Japanese snowball. ($\times \frac{1}{2}$)

in nodding cymes. Var. *Hessei*, Rehd. (*V. Hessei*, Koehne). Of dwarfer dense habit: lvs. broadly ovate, with fewer shallower teeth: cymes, fls., and frs. smaller: stamens as long as corolla.

23. *theiferum*, Rehd. Upright shrub, to 12 ft.: branchlets glabrous: lvs. ovate-oblong, acuminate, rounded at the base, remotely denticulate, dark green and glabrous above, glabrous beneath except silky hairs on the veins, 3-5 in. long; petiole about ½ in. long: fls. in cymes, 1-1½ in. across; calyx purple; stamens shorter or as long as corolla: fr. red, ovoid, ½ in. long. May, June: fr. in Oct. Cent. and W. China. S.T.S. 2:121.—Strong-growing shrub with handsome large foliage and ornamental bright red frs. in autumn. It has proved fairly hardy at the Arnold Arboretum, only the tips of young branches being sometimes killed back.

24. *dentatum*, Linn. ARROW-WOOD. Upright bushy shrub, attaining 15 ft., with glabrous branches: lvs. rather long-petioled, orbicular to ovate, acute or shortly acuminate, coarsely dentate, glabrous or pubescent only in the axils of the veins beneath, 1½-3 in.

long: fls. in long-peduncled, glabrous cymes 2-3 in. broad: fr. subglobose, bluish black, glaucous. May, June; fr. in Oct. New Bruns. to Minn., south to Ga. G.F. 10:332. Em. 2:414.—Handsome native shrub, thriving best in moist soil.

3924. *Viburnum dilatatum*. ($\times \frac{1}{2}$)

25. *venosum*, Brit. (*V. mölle*, Auth., not Michx. *V. Hanceanum*, Dipp., not Maxim. *V. nepalense*, Hort.). Fig. 3925. Shrub, to 8 ft., with grayish brown branches; young branchlets stellate-pubescent: lvs. ovate to orbicular, coarsely and sharply dentate, glabrous or nearly so above, stellate-pubescent beneath, particularly on the veins, 2-5 in. long, with prominent veins beneath; petioles $\frac{1}{4}$ - $\frac{3}{4}$ in. long, pubescent: cyme long-stalked, slightly pubescent, $2\frac{1}{2}$ -4 in. across: fr. globose or globose-ovoid, $\frac{1}{4}$ in. long, bluish black. June, July; fr. in Sept. Mass. to Va. S.T.S. 1:43. G.F. 4:29 (adapted in Fig. 3925). M.D.G. 1891:267. Var. *Cánbyi*, Rehd. (*V. lævigatum*, Hort., not Ait.). Lvs. thinner, less pubescent beneath, larger and broader, the pair below the infl. often 2-3 in. broad: cymes larger. Del. to Pa. M.D.G. 1904:217 (habit). This is a very handsome variety on account of its larger bright green lvs. and larger cymes. Var. *longifolium*, Rehd. (*V. dentatum* var. *longifolium*, Dipp.). Lvs. narrower and longer, generally ovate-oblong, pubescent on both sides, more densely beneath: infl. glabrous or pubescent. Blooms several weeks before the type.

26. *scabréllum*, Chapm. (*V. dentatum* var. *semitomentosum*, Michx. *V. mölle*, American Auth., not Michx.). Shrub, to 6 ft.: branches reddish brown; branchlets rough with stellate pubescence: lvs. ovate, rarely broadly ovate, acute or acuminate, remotely dentate with broad shallow teeth, or crenately dentate, glabrous or slightly pubescent above, stellate-pubescent beneath, $1\frac{1}{2}$ -4 in. long: cymes rather densely stellate-pubescent: fr. globose-ovoid, $\frac{1}{2}$ in. long, bluish black. June; fr. in Sept., Oct. Pa. to Fla. and Texas. B.B. (ed. 2) 3:271.—Has proved not quite hardy at the Arnold Arboretum.

27. *mölle*, Michx. (*V. Demetriónis*, Deane & Rob.). Shrub, to 12 ft.: bark separating in thin flakes: lvs. orbicular or broadly ovate, cordate, shortly acuminate, coarsely dentate, pubescent beneath or almost glabrous, $2\frac{1}{2}$ -4 $\frac{1}{2}$ in. long: cymes long-peduncled, puberulous, about $2\frac{1}{2}$ in. broad: fr. oblong, almost $\frac{1}{2}$ in. long, bluish black. May; fr. in Aug. Ky., Mo., Iowa. B.B.

(ed. 2) 3:272.—Has proved hardy at the Arnold Arboretum.

28. *pubescens*, Pursh. Fig. 3926. Bushy shrub, 3-6 ft. high, with slender, upright branches: lvs. oval to ovate, rounded or cordate at base, acute or acuminate, coarsely dentate, almost glabrous above, pubescent beneath, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. long: cymes short-peduncled, dense, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. broad: stamens exceeding the corolla about one-half: fr. oval, almost black, slightly flattened. June, July. Que. to Ga., west to Man. and Ill. G.F. 3:125 (adapted in Fig. 3926). A.F. 12:1101. Gng. 5:311. M.D.G. 1903:404.—Handsome shrub of compact habit. Var. *affine*, Rehd. (*V. affine*, Bush). Lvs. nearly glabrous; petioles $\frac{1}{4}$ - $\frac{1}{2}$ in. long, sometimes shorter. Mo.

29. *acerifolium*, Linn. DOCKMACKIE. Shrub, attaining 5 ft., with slender, upright branches: lvs. orbicular or ovate, 3-lobed, with acute or acuminate lobes, coarsely dentate-serrate, pubescent or at length almost glabrous, 2-5 in. long: fls. yellowish white: cymes long-peduncled, terminal, $1\frac{1}{2}$ -3 in. broad: fr. almost black, ovoid. May, June. New Bruns. to Minn., south to N. C. Em. 2:414.—It grows fairly well in drier situations under trees. The foliage assumes a handsome dark purple fall color. Var. *glabrescens*, Rehd. Lvs. glabrous or nearly so beneath even while young. N. C.

30. *pauciflorum*, Raf. Straggling shrub, attaining 5 ft.: lvs. orbicular to oval, coarsely dentate, with 3 short lobes above the middle or often without, glabrous or slightly pubescent beneath when young, 2-3 $\frac{1}{2}$ in. long: cymes few-fl., small, on lateral, short usually 2-lvd. branchlets: fr. scarlet, subglobose. June. Lab. to Alaska, south to Vt. and Colo. in the mountains. G.F. 3:5.—It does not usually succeed well in cult.; requires shade and moist porous soil.

31. *Opulus*, Linn. EUROPEAN CRANBERRY-BUSH. Shrub, attaining 12 ft., with rather smooth light gray branches and sts.: lvs. broadly ovate, 3-lobed, with coarsely dentate-serrate, acuminate lobes, pubescent beneath, 2-4 in. long; petioles with narrow groove and large disk-like glands: fls. white, in peduncled cymes, 3-4 in. broad: fr. subglobose to oval, scarlet. May,

3925. *Viburnum venosum*. ($\times \frac{1}{2}$)

June; fr. in Aug. Eu., N. Afr., N. Asia. H.W. 3, p. 131. R.F.G. 17:1171. S.B.F. 4:639. Var. *nānum*, Jacq. A very dwarf, compact, small-lvd. form; flowers but very rarely. Var. *stérile*, DC. (*V. roseum* and *V. rosaceum*, Hort.). GUELDER ROSE. SNOWBALL. Fig. 3927. All fls. sterile, forming large, globose heads.

Gn. 1:9. Gn. 56, p. 83; 76, p. 35. F.E. 15:319; 20:313. G.W. 6, p. 159.—This is a very showy variety, but it lacks the decorative frs. Var. *xanthocarpum*, Spaeth. Fr. yellow. There are also variegated forms of the type and of the sterile variety.

32. *americanum*, Mill. (*V. Opulus* var. *americanum*, Ait. *V. trilobum*, Marsh. *V. opuloides*, Muhl. *V. edule*, Pursh. *V. Oxyccocus*, Pursh.). CRANBERRY BUSH. HIGH CRANBERRY. Fig. 3928. Closely allied to the preceding species, but habit more open and spreading: lvs. with coarsely toothed or nearly entire lobes, pilose on the veins beneath or nearly glabrous, 2-5 in. long; petiole with shallow groove and small, usually stalked glands: cymes with shorter peduncles; stamens somewhat shorter. May, June: fr. in Aug., Sept. B.B. (ed. 2) 3:270 (as *V. Opulus*). New Bruns. to Brit. Col., south to N. J. and Ore.—Handsome native shrub, very decorative in fr., which begins to color by the end of July, remains on the branches and keeps its bright scarlet color until the following spring. The berries are not eaten by birds.

33. *Sargentii*, Koehne. Similar to the preceding, of more upright, denser habit: bark of sts. darker, fissured and somewhat corky, young branchlets with prominent lenticels: lvs. of thicker texture, pubescent beneath, the upper lvs. with much elongated and usually entire middle lobe and small, short, spreading lateral lobes; petioles with large glands: sterile fls. larger, sometimes to $1\frac{1}{4}$ in. across; anthers purple, rarely yellow: fr. globose, in usually upright cymes. N. China, Japan. S.I.F. 2:73. S.T.S. 1:42. M.D.G. 1904:329.—Intro. under the name *V. Opulus* from Pekin. It does not seem to fruit as profusely as *V. Opulus*, but is handsomer in bloom and of more compact habit. Var. *calvescens*, Rehd. Lvs. glabrous or nearly so beneath.

V. betulifolium, Batal. Allied to *V. Wrightii*. Lvs. ovate to rhombic-ovate, coarsely serrate, glabrous except a few hairs on the veins beneath, $1\frac{1}{2}$ -3 in. long; petioles about $\frac{1}{2}$ in. with small stipules: infl. 2-4 in. across: stamens longer than corolla: fr. red. Cent. and W. China. S.T.S. 2:147.—*V. bracteatum*, Rehd. Allied to *V. pubescens*. Lvs. orbicular-ovate, obtusely sinuate-dentate, pubescent on the veins beneath, 2-5 in. long; petioles about $\frac{3}{4}$ in. long, stipulate: infl. $1\frac{1}{2}$ -3 in. across, with conspicuous bracts: fr. ovoid, bluish black. Ga. S.T.S. 1:68. Hardy at the Arnold Arboretum.—*V. buddleiifolium*, C. H. Wright. Allied to *V. Lantana*. Densely stellate-tomentose: lvs. oblong-lanceolate, pubescent above, grayish tomentose beneath, 3-6 in. long: infl. dense, about 3 in. across: fr. ovoid, black. Cent. China.—*V. burejaeticum*, Regel & Herder (*V. burejanum*, Herder). Allied to *V. Lantana*. Lvs. short-petioled, oval or ovate, acute or obtuse, denticulate, with anastomosing

veins, sparingly pubescent beneath, $1\frac{1}{2}$ -3 in. long: infl. dense, $1\frac{1}{2}$ -2 in. across: fr. ovoid, bluish black. N. China, Manchuria. Gt. 11:384.—*V. cinnamomifolium*, Rehd. Allied to *V. Tinus*. Evergreen: lvs. elliptic-oblong, 3-nerved, nearly entire, glabrous, 3-5 in. long: infl. loose, 5-7 in. across: fr. ovoid, $\frac{1}{2}$ in. long, shining bluish black. W. China. S.T.S. 2:114.—*V. cordifolium*, Wall. Closely related to *V. alnifolium*, but without radiant fls.: cymes loose, 2-6 in. across: fertile fls. larger: lvs. usually narrower. Himalayas, W. China. S.T.S. 2:138.—*V. coriaceum*, Blume= *V. cylindricum*.—*V. crassifolium*, Rehd. Hardy evergreen species: lvs. deep green,

3927. Snowball.—*Viburnum Opulus* var. sterile. All the fertile flowers are changed to sterile, showy ones. ($\times 1/4$)

slightly toothed around margins: fls. white, with 5 prominent anthers, chocolate-colored. China.—*V. cylindricum*, Hamilt. (*V. coriaceum*, Blume). Evergreen shrub or tree, to 50 ft., glabrous: lvs. oval to oblong, acuminate, usually remotely toothed above the middle, 3-8 in. long: infl. 2-4 in. across, rather dense: fls. white or pinkish, tubular, $\frac{1}{2}$ in. long; stamens exserted: fr. black, ovoid. Himalayas, W. China. G.C. III. 52:371. S.T.S. 2:143.—*V. dahuricum*, Pall.= *V. mongolicum*.—*V. dasyanthum*, Rehd. Allied to *V. Wrightii*. Lvs. ovate to oblong, acuminate, nearly glabrous, 2-5 in. long: infl. lax, 3-4 in. across: pedicels, ovary, and outside of corolla villous: fr. red. Cent. China. S.T.S. 2:149.—*V. Davidii*, Franch. Allied to *V. Tinus*. Evergreen, compact shrub, to 3 ft.: lvs. elliptic to elliptic-obovate, short-acuminate, 3-nerved, 2-6 in. long: infl. dense, 2-3 in. across: fr. blue, ovoid, $\frac{1}{4}$ in. long. W. China. R.H. 1913, p. 375. J.H.S. 38, p. 63 (fig. 44). G.M. 55:273.—*V. densiflorum*, Chapm. Closely allied to *V. acerifolium*. Lower: lvs. smaller, 1-2 in., with mostly shorter lobes or none: cymes denser. W. Fla.—*V. ellipticum*, Hook. Shrub, attaining 5 ft., allied to *V. acerifolium*, but lvs. not lobed, oval to elliptic-oblong: fr. oblong-oval, almost $\frac{1}{2}$ in. long. Wash. to Calif.—*V. erodum*, Thunb. Allied to *V. Wrightii*. Lvs. oblong-ovate or oblong-obovate, pubescent on the veins beneath, 2-3 $\frac{1}{2}$ in. long; petioles short, stipulate: cymes long-peduncled, loose, 2 $\frac{1}{2}$ -3 in. across: fr. red. Japan. G.F. 9:85.—*V. fragrans*, Bunge. Allied to *V. suspensum*. Lvs. deciduous, obovate-oblong, sharply dentate, glabrous beneath: panicles with or before the lvs., about $1\frac{1}{2}$ in. long: corolla salver-shaped, nearly $\frac{1}{2}$ in. long, fragrant, white, pinkish in bud. N. China. Recently intro. and hardness not yet tested, but probably fairly hardy as far north as Mass.; very floriferous and in bloom apparently one of the handsomest viburnums.—*V. furcatum*, Blume. Closely related to *V. alnifolium*, but of more upright habit and stamens shorter than corolla: seed with the ventral furrow more open and broader. Japan. S.I.F. 2:74. S.T.S. 2:119.—*V. Harryanum*, Rehd. Evergreen: lvs. orbicular to obovate or broadly oval, glabrous, $\frac{1}{2}$ -1 in. long: cymes 1-1 $\frac{1}{2}$ in. across: fr. black. W. China. Very distinct in its small privet-like foliage.—*V. Hénryi*, Hemsl. Allied to *V. Sieboldii*. Evergreen, to 10 ft.: lvs. elliptic-oblong to oblong-obovate, acuminate, glabrous or nearly so, shallowly serrulate, 2-5 in. long: panicles broadly pyramidal, 2-4 in. long: fr. ovoid, $\frac{1}{2}$ in. long, first red, then black. Cent. China. B.M. 8393. S.T.S. 2:116. G.C. III. 48:264, 265; 60:193. R.B. 35, p. 296. Tender.—*V. hupehense*, Rehd. Allied to *V. Wrightii*. Lvs. broadly ovate, acuminate, dentate, slightly pubescent above, more densely below, 2-3 in. long: petiole stipulate: cymes stellate-pubescent: fr. ovoid, dark red. Cent. China. Hardy at the Arnold Arboretum.—*V. ichangense*, Rehd. (*V. erosum* var. *ichangense*, Hemsl.). Allied to *V. Wrightii*. Lvs. short-petioled, ovate to ovate-lanceolate, acuminate, dentate, rough above, pubescent beneath, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. long: petiole $\frac{1}{2}$ in. long or less, stipulate: cymes slender-stalked, 1-2 in. across: fr. ovoid, red. Cent. and W. China. S.T.S. 2:150.—*V. kansuense*, Batal. Allied to *V. Opulus*. Lvs. slender-stalked, ovate in outline, deeply 3-5-lobed, with coarsely toothed acuminate lobes, hairy on the veins, 1-2 in. long: cymes 1-1 $\frac{1}{2}$ in. across without sterile fls.: fr. red. W. China. A graceful shrub very distinct in its small deeply lobed lvs.—*V.*

3926. *Viburnum pubescens*. ($\times 1/2$)

lobophyllum, Graebn. Allied to *V. Wrightii*. Lvs. orbicular-ovate to broadly obovate, abruptly acuminate, coarsely toothed, glabrous or hairy on the veins beneath, 2-4 in. long; cymes 2-4 in. across; stamens longer than the corolla: fr. red. W. China. G.C. III. 60:197. S.T.S. 2:147.—*V. mongolicum*, Rehd. (*V. dahuricum*, Pall.). Shrub, to 6 ft.: lvs. broadly ovate to oval, crenate-denticulate, stellate-pubescent beneath, $1\frac{1}{2}$ - $2\frac{1}{2}$ in. long; fls. salver-shaped, in short panicles: fr. finally black. Dahuria to N. W. China. Possibly not in cult.; the plant figured as *V. dahuricum* in horticultural literature is not this species.—*V. orientale*, Pall. Allied to *V. acerifolium*: shrub, attaining 4 ft.: lvs. with simple, not fasciated hairs on the veins beneath and not glandular dotted beneath: fr. red. June, July. W. Asia. Gt. 17:567.—*V. phlebótrichum*, Sieb. & Zucc. Allied to *V. Wrightii*. Lvs. short-petioled, ovate to elliptic-ovate, acuminate, glabrous, except hairy on the veins beneath, $1\frac{1}{2}$ - $2\frac{1}{2}$ in. long; cymes slender-stalked, nodding, loose, 1- $1\frac{1}{2}$ in. across: calyx and pedicels purple: fr. ovoid, red. Japan. S.T.S. 2:120. S.I.F. 2:73.—*V. propinquum*, Hemsl. Allied to *V. Tinus*. Evergreen: lvs. elliptic to elliptic-oblong or ovate-lanceolate, acuminate, 3-nerved, remotely denticulate, glabrous, $1\frac{1}{2}$ - $3\frac{1}{2}$ in. long; cymes

3928. *Viburnum americanum*. a, Single form of the common snowball as it grows in the wild; b, fruits. ($\times\frac{1}{4}$)

$1\frac{1}{2}$ - $2\frac{1}{2}$ in. across, glabrous; fr. globose-ovoid, bluish black. Cent. and W. China. S.T.S. 2:115.—*V. sympodiale*, Graebn. Closely related to *V. alnifolium*. Lvs. narrower, ovate to elliptic-ovate, more finely serrulate and usually rounded at the base, 3-5 in. long; cymes $2\frac{1}{2}$ - $3\frac{1}{2}$ in. across; fr. purple. Cent. and W. China. S.T.S. 2:139.—*V. urceolatum*, Sieb. & Zucc. Low straggling shrub: lvs. slender-petioled, ovate-lanceolate, crenate-serrulate, glabrous, $2\frac{1}{2}$ -5 in. long; fls. tubular, scarcely $\frac{1}{2}$ in. long, in slender-stalked cymes $1\frac{1}{2}$ - $2\frac{1}{2}$ in. across; fr. ovoid, black. Japan. S.T.S. 2:141. Recently intro.; one of the least ornamental in bloom.—*V. utile*, Hemsl. Evergreen shrub, to 6 ft.: lvs. elliptic-ovate to ovate-oblong, obtusish, entire, lustrous above, densely whitish tomentose beneath, 1-3 in. long; cymes stalked, dense, 2-3 in. across; fr. bluish black, ovoid, $\frac{1}{2}$ in. long. B.M. 8174. S.T.S. 2:142. G. 35:380. R.B. 35, p. 280.—*V. Vetchii*, C. H. Wright. Allied to *V. Lantana*. Shrub, to 5 ft.: young branchlets and petioles stellate-tomentose; lvs. ovate, acuminate, cordate at the base, remotely dentate, stellate-tomentose beneath, slightly stellate-pubescent above, 3-5 in. long; cymes 4-5 in. across, stellate-tomentose; fr. red, finally black. Cent. China.

ALFRED REHDER.

VÍCIA (classical Latin name). VETCH. TARE. *Leguminosæ*. Mostly weedy or insignificant-looking plants, but a few are grown for the bright flowers, others of late for green-manure crops (see *Cover-crops*), and one (*V. Faba*) is a garden bean.

Herbs, mostly climbing, with pinnate foliage, closely allied to *Lathyrus*, *Pisum*, and *Lens*, but differing in minute floral characters: wings adhering to the keel; style very slender, with beard or hairs all around the upper part or only at the apex: pod flat, 2- to many-seeded, 2-valved, and dehiscent, the seeds either globular or flattish; stamens diadelphous (9 and 1): fls. mostly blue or violet, sometimes yellowish or white.—About 150 species widely spread in the northern hemisphere and some in S. Amer. About two dozen species occur in N. Amer., some of the species intro. The species are mostly cool-season plants of easy cult. The interest in the vetches in this country is mostly for their value as soil-covers and for foliage. *V. sativa* and *V. villosa* are the important species at present for agricultural purposes, and *V. Cracca*, *V. Gerardii*, and *V. fulgens* are sometimes used as ornamentals. For literature, see Farmers' Bulls. Nos. 515 and 529, Bur. Pl. Ind. Circ. No. 15, and U. S. Dept. Agric. Circ. No. 45.

A. Pods 1- $1\frac{1}{2}$ in. broad with spongy septæ between the seeds; seeds oblong, funiculus attached at the end: st. thick, erect, 4-angled: lfts. without tendrils.

1. *Faba*, Linn. (*Faba vulgaris*, Moench. *F. sativa*, Bernh.). BROAD BEAN. WINDSOR BEAN. ENGLISH DWARF BEAN. HORSE BEAN. Figs. 478, 479, Vol. I. Strong erect annual, 2-4 ft., glabrous or nearly so, very leafy: lfts. 2-6, the lower ones not opposite on the rachis, the terminal one wanting or represented by a rudimentary tendril, oval to elliptic and obtuse or mucronate-pointed: fls. in the axils, dull white and with a large blue-black spot: pods large and thick, from 2 or 3 in. even to 18 in. long, the seeds large and often flat. Probably native to N. Afr. and S. W. Asia. R.F.G. 22:238.—Much grown in the Old World, but the hot dry summers prevent its cult. in most parts of the U. S. It is grown successfully in parts of Canada, particularly in the maritime provinces, and also in Calif. as a winter vegetable or green-manure crop. The plant is grown mostly for cattle-feeding in the U. S. but the beans are extensively used in Eu., both full grown and immature, for human food. This bean has been cult. from prehistoric times and its nativity is in doubt. The plant is hardy and seeds should be sown early, when the season is cool. The unripe seeds are reported to have caused cases of poisoning, but little is known as to the conditions of the poison production.

AA. Pods rarely over $\frac{2}{5}$ in. broad, without spongy septæ; seeds nearly spherical, funiculus attached at the side: st. slender.

B. Infl. very short-stalked or sessile: fls. medium to large, often 1-2 in the lf.-axis.

C. Stipules very large, mostly toothed; lvs. with 1-3 pairs of lfts.: plants annual.

2. *narbonensis*, Linn. FRENCH OR NARBONNE VETCH. Annual, pubescent, dark green: st. stout, erect or ascending, 4-angled, 2-4 ft. tall: lower lvs. with a single pair of lfts. without tendrils, upper with 2-3 pairs of lfts. and branching tendrils; lfts. $\frac{1}{2}$ -2 in. long, $\frac{3}{8}$ - $1\frac{1}{2}$ in. broad, somewhat fleshy, oval to elliptic or cuneate at base, entire or rarely few-toothed above: infl. 1-2 (rarely 5)-fid.: fls. stalked, $\frac{1}{2}$ - $\frac{3}{4}$ in. long; calyx-teeth unequal, banner lilac to purple or bluish, wings and keel bluish: pod broadly linear to rhombic-linear, 2- $2\frac{1}{2}$ in. long, $\frac{3}{8}$ in. broad, compressed; seeds brown, $\frac{1}{8}$ in. diam. S. Eu., cult. for forage. R.F.G. 22:241.—Not very hardy and turns black under severe summer heat. Best adapted to the N. W. Pacific coast. It has no advantage over common vetch and the seed cost is much greater.

CC. Stipules small; lvs. with numerous pairs of lfts. (*V. oroboides* has often only 2 hairs.)

D. Banner distinctly pubescent without: plants annual.

3. *pannonica*, Crantz. Annual, shortly soft to shaggy pubescent: sts. 2 to several, prostrate to ascending or climbing, rarely unbranched, 4-20 in. long: lvs. short-petioled to nearly sessile, the lower with 4, the upper with often 8 pairs of lfts. and mostly short tendrils; lfts. very short-petioled, linear to oblong: infl. very short-stalked, 2-4 (rarely 1)-fid.: fls. $\frac{1}{2}$ - $\frac{5}{8}$ in. long, pedicel much shorter than the calyx; corolla about 3 times longer than the calyx, yellowish to purple: pod about $1\frac{1}{4}$ in. long, $\frac{3}{8}$ in. broad, 2-8 (mostly 3-5)-seeded; seed $\frac{1}{8}$ in. diam., velvety black. S. and S. E. Eu. R.F.G. 22:243.

DD. Banner glabrous or with few scattered hairs.

E. Plants perennial: lvs. without tendrils; lfts. few.

F. Lvs., lower with 1-2, upper with 4-6 pairs of lfts.: fls. single, purple-violet.

4. *pyrenæica*, Pourr. Perennial, glabrous or nearly so: sts. 4-12 in. long, prostrate or ascending, angular: lower lvs. with only 1-2 pairs of lfts., the upper with

4-6 pairs of lfts. and unbranched or rarely 2-3-branched tendrils: fls. solitary, large; calyx sparingly pubescent; corolla purple-violet: pod broadly linear, glabrous; seed smooth, brown, mottled. S. W. France.

FF. Lvs. with only 1-3 pairs of lfts.: plant resembling a *Lathyrus*.

5. *oroboides*, Wulf. (*Orobis lathyroides*, Sibth. & Smith). Perennial, glabrous or sparingly pubescent: sts. mostly erect and unbranched, 2-3 ft.

tall: lvs. short-petioled, with 1-3 pairs of lfts., ending in a sharp point, without tendrils; lfts. ovate, elliptic to oblong: infl. sessile, mostly 3-7-fld.: fls. $\frac{1}{2}$ - $\frac{3}{4}$ in. long, short-pedicelled; calyx-teeth equaling or shorter than the tube; corolla yellowish white to golden: pod linear-oblong, 1-1 $\frac{1}{2}$ in. long; seed nearly spherical, brown, $\frac{1}{8}$ in. diam. S. E. Eu. R.F.G. 22:258. B.M. 2098.

EE. Plants annual or biennial: fls. violet to bluish: lvs. with tendrils; lfts. many, small.

F. Lfts. oblong, oval or obovate.

6. *sativa*, Linn. COMMON VETCH or TARE. Annual or biennial, not surviving the winter in the N., more or less pubescent, 2-3 ft. high: lfts. 7 pairs or less, elliptic, oblong or oblanceolate, mostly truncate and apiculate at the top, the tendril part of the lf. extended: fls. usually 2 in. each axil, about 1 in. long, purplish: pods 2-3 in. long when mature. Eu., and naturalized in some parts of the U. S. R.F.G. 22:248. B.B. 2:2621. —Much cult. abroad as a forage plant; in this country grown for similar purposes and also somewhat as a cover-crop for orchards. Best adapted to S. E. U. S. and the Pacific coast as a winter crop for green manure or sown with oats, wheat, rye, or barley for hay. As a spring crop it succeeds only where the summers are fairly cool. Not much injured by a temperature of 10° F. but zero weather results in much winter-killing. The name winter vetch is more commonly applied to winter strains of *V. sativa* in Eu. Seeds sometimes used for making flour. Var. *alba*, Beck (*V. alba*, Moench). Fls. white or whitish: seeds mostly whitish to gray. Var. *macrocarpa*, Moris. Fls. 1 $\frac{1}{8}$ -1 $\frac{1}{4}$ in. long: seed compressed, $\frac{1}{8}$ - $\frac{3}{16}$ in. diam.

FF. Lfts., except of the lower lvs., linear or linear-oblong.

7. *angustifolia*, Linn. Annual, glabrous or pubescent: sts. slender, 1-2 ft. long: lvs. short-petioled or nearly sessile with 4-8 pairs of lfts. and an unbranched or 2-3-branched tendril; lfts. linear, lanceolate or oblanceolate, up to 1 $\frac{1}{2}$ in. long and $\frac{1}{8}$ in. wide: fls. purple, $\frac{1}{2}$ - $\frac{3}{4}$ in. long: pod glabrous, 1-2 in. long. Eu. R.F.G. 22:250. B.B. 2:2622. —Naturalized and established from Nova Scotia to Fla. The seeds mature earlier than those of *V. sativa*. In some parts of the S. it often makes up a considerable portion of the hay.

BB. Infl. distinctly, mostly long-stalked, few- to many-fld.

C. Fls. $\frac{1}{2}$ in. long or longer: infl. mostly many-fld.

D. Lfts. ovate to oblong, never linear to lanceolate, few.

E. Pairs of lfts. 10-15.

8. *gigantæa*, Hook. Perennial, pubescent, high-climbing: lfts. 10-15 pairs, narrow-oblong, obtuse and mucronulate: fls. about $\frac{1}{2}$ in. long, pale purple, in 7-18-fld. racemes. Calif. and N. —Has been offered by dealers in native plants.

EE. Pairs of lfts. 4-9.

F. Color of fls. nearly white: infl. mostly 8-20-fld.

9. *caroliniana*, Walt. CAROLINA VETCH. Perennial, nearly or quite glabrous: lfts. oblong to linear-oblong, usually obtuse or emarginate: fls. nearly white, $\frac{1}{2}$ in. or less long, in several to many-fld. loose racemes. Minn. and Kans. eastward. B.B. 2:2616. —Has been offered.

FF. Color of fls. blue to purple: infl. mostly 6-14-fld.

G. Shape of lfts. elliptic-oblong, truncate or retuse at the apex.

10. *americana*, Muhl. AMERICAN VETCH. Fig. 3929. Perennial, trailing or climbing, 3 ft. long, nearly or quite glabrous: lfts. 8-14, elliptic to oblong, obtuse or sometimes emarginate at the apex: fls. purplish, about $\frac{3}{4}$ in. long, in few-fld. loose racemes: pods 1-1 $\frac{1}{4}$ in. long; seed brown, $\frac{1}{8}$ in. diam. Moist lands across the continent and as far south as Ky. B.B. 2:2614. —Has been offered by dealers in native plants.

GG. Shape of lfts. ovate, obtuse at the apex.

11. *dumetorum*, Linn. Annual, glabrous: st. 1 $\frac{1}{2}$ -8 ft. long, trailing or climbing: lfts. 8-10, ovate to oblong: infl. 2- or mostly 6-14-fld.: fls. $\frac{1}{2}$ - $\frac{3}{4}$ in. long; calyx with very unequal large triangular teeth; corolla purple becoming dirty reddish yellow to greenish: pod oblong to oblong-linear, 1 $\frac{1}{2}$ -2 in. long and about $\frac{3}{8}$ in. broad; seed spherical, about $\frac{1}{4}$ in. diam., dark brown. Eu. R.F.G. 22:253. —Cult. for forage in Germany.

DD. Lfts. linear to lanceolate, numerous.

E. Limb of the banner as long as or longer than its claw.

F. Color of fls. red or nearly scarlet and purple-striped.

12. *fulgens*, Batt. SCARLET VETCH. Annual, 3-5 ft., pubescent: lfts. 8-12 pairs, oblong or lance-linear,

3929. *Vicia americana*. (X $\frac{1}{2}$)

3930. *Vicia villosa*, the hairy vetch. (X $\frac{1}{2}$)

mucronate: fls. small, red or nearly scarlet and purple-striped, in a compact raceme or spike. Algeria.—Adapted only to the Pacific and Gulf states. Usually of poor seed habits, but quite drought-resistant from spring sowings.

FF. *Color of fls. purplish or violet.*

13. *Cracca*, Linn. Perennial, usually pubescent: lfts. 9–12 pairs, thin, linear to oblong, mucronate: fls. purplish, about $\frac{1}{2}$ in. long, in a rather dense raceme. Across the continent and south to Ky.; also in Eu. and Asia. R.F.G. 22:230. B.B. 2:2613. Var. *Gerárdii*, Gaud. (*V. Gerárdii*, All.). Described as a hardy annual: pubescent: lfts. numerous, narrow-oblong, very obtuse but with a short mucro.: fls. violet, small, in short racemes. S. Eu. R.F.G. 22:233.—Offered by seedsmen as a fl.-garden subject.

EE. *Limb of banner not over half as long as its claw.*

F. *Pod glabrous.*

G. *Plant with thick, shaggy pubescence: fls. up to 1 in. long.*

14. *villòsa*, Roth. HAIRY, SAND OR RUSSIAN VETCH. Fig. 3930. Annual or biennial (sometimes perennial?), enduring the winters in the N., villous-pubescent: lfts. 5–10 pairs, elliptic-oblong, rounded at the tip but usually ending in a very minute point: fls. violet-blue, in long 1-sided axillary about 30-fl'd. racemes. Eu., Asia. R.F.G. 22:234.—Now considerably used as a cover-crop. More hardy than *V. sativa* but the pods shatter more easily and the seeds are smaller. In N. Italy it can be cut early enough to produce a crop of millet the same season.

GG. *Plant with short appressed pubescence: fls. only up to $\frac{3}{8}$ in. long.*

15. *dasycarpa*, Ten. Annual or sometimes perennial, slightly pubescent: st. slender, angled, climbing to prostrate: lvs. nearly sessile; lfts. about 10 pairs, oblong-ovate to linear or lanceolate: infl. short-pedicelled: fls. few to many, whitish below, blue-violet above, becoming blue with age: pod $\frac{7}{8}$ – $1\frac{1}{4}$ in. long, $\frac{3}{8}$ in. broad; seeds rather large, purplish brown. Eu. R.F.G. 22:235.—As hardy as *V. villosa* and matures earlier than *V. sativa*. Produces good seed crops. Naturalized in W. Ore.

FF. *Pod pubescent: plant with thick shaggy pubescence: fls. whitish below, purplish above.*

16. *atropurpurea*, Desf. PURPLE VETCH. Annual, resembling *V. villosa* in habit, sometimes with soft whitish pubescence: st. 8–30 in. long, angular, prostrate or climbing: lvs. with 5–8 pairs of lfts. with branched tendrils; lfts. oblong-linear to almost linear, apex pointed: infl. 2–12-fl'd.: fls. about $\frac{5}{8}$ in. long; corolla whitish below, purplish above; pod broadly linear to rhombic-linear, $1\frac{1}{2}$ in. long, $\frac{1}{8}$ – $\frac{1}{2}$ in. broad, pubescent; seeds somewhat roundish, somewhat compressed, black. S. Eu. R.F.G. 22:239. B.R. 871.—Of good seed habits. Best adapted to the Pacific and Gulf coasts and produces excellent yields from spring plantings in semi-arid regions.

CC. *Fls. $\frac{3}{8}$ in. long or less: infl. 2–4-few-fl'd.: plants annual.*

17. *Ervilia*, Willd. (*Ervum Ervilia*, Linn.). BITTER VETCH. Annual, pubescent: st. erect, angular: lvs. with 8–12 pairs of lfts. without tendrils; lfts. oblong-linear to linear: infl. 2–4-fl'd.; corolla rose-colored, veined; pod broadly linear, smooth, yellowish; seed smooth, reddish brown. Eu. R.F.G. 22:261.—Extensively grown in Asiatic Turkey and seed shipped in large quantities to England and other countries for stock feed, especially sheep. Yields about 30 lbs. of seed to the acre. Plants not readily eaten by livestock but it has been found to be an excellent winter green-manure crop in Calif.

P. L. RICKER.

VICTÒRIA (in honor of Queen Victoria). *Nymphaeaceae*. ROYAL WATER-LILY. The great water-lily of the Amazon, sometimes grown in large aquaria.

This remarkable aquatic genus may be recognized by its huge round floating lvs. often 6 ft. or more in diam., with the margin turned up at right angles to the water surface to a height of 3–8 in., making a basin-like object. Fls. (12–18 in. across) nocturnal, opening on two successive days about 5 P.M. and remaining open until the middle of the following morning; the first evening the inner floral lvs. remain loosely closed over the stigma, the fl. is creamy white, and exhales a delicious fragrance somewhat like pineapple; the second evening the floral lvs. spread wide open, and the color changes to pink or red; ovary inferior, densely prickly, and surmounted by a short broad tube, on the sides and summit of which the floral lvs. are situated; sepals 4; petals 50–70, obtuse, oblong-ovate to sublinear, rather thin and delicate in texture; staminodia about 20; stamens 150–200, linear-lanceolate; paracarpels about 25, forming a ring of thick fleshy bodies between the stamens and the styles; carpels 30–40; stigma forming a broad basin-like depression, 2– $2\frac{1}{2}$ in. wide, in the midst of the fl., with a central conical continuation of the floral axis, the basin filled with fluid on the first evening of opening; carpellary styles broad and fleshy in the lower part, produced upward to a fleshy subulate incurved process about $\frac{1}{2}$ in. long: in fr. all of the floral lvs. have decayed away, leaving the basal tube of the torus at the top of a great prickly berry, half the size of one's head; seeds greenish or brownish black, about the size of a pea.—The genus is represented by 2 well-defined species, inhabiting still waters of S. Amer. from British Guiana to Argentina.

In its native haunts victoria grows in 4 to 6 feet of water, in great patches miles in extent, and is perennial. The tuberous rhizome stands erect in the mud, where it is anchored by innumerable spongy roots which spring from the bases of the leaves in groups of ten to thirty or forty. The tuber may be as much as 6 inches in diameter and 2 feet long. It decays below as it grows above. The leaves are arranged in 7 to 18 order, the flowers being extra-axillary. Each leaf after the first seedling leaf has a broadly ovate fused pair of stipules, these organs serving to protect the apex of the stem. The petioles and peduncles are terete, 1 to 2 inches in diameter, covered with stout fleshy prickles, and traversed internally by four large, and a number of smaller air-canals. The petioles attain to a length much greater than the depth of the water, so that the leaves can adjust themselves to changes of the water-level, though Banks states that they may be completely submerged in times of flood. The gigantic leaves are covered beneath with a close network of prickly veins, the larger of which project an inch or more from the leaf-surface, the tissues are full of air-spaces and -canals, thus buoying up the mass of cellular matter. Besides many stomata on the upper surface of the leaf, which open into the air-chambers of the mesophyll, there are countless tiny depressions, in each of which one can see with a hand-lens that the leaf is perforated with a fine hole; these holes were called by Planchon "stomatodes" (F.S. 6:249). He considered them to be useful as air-holes to let out gases which, rising from the water or mud, might be caught in the deep meshes of the netted veins on the under side of the leaf. It is also to be noted that, in spite of the cup-like form of the leaves, water from rain or other sources does not remain on the surface; it doubtless runs down at once through the tiny perforations. This would be an indispensable protection against fungi and algæ, and for the function of assimilation.

A single leaf, by its buoyancy, may sustain a weight of 150 or 200 pounds. Gurney at Tower Grove Park, St. Louis, covers the leaf with a large round quilted pad, then lays on an equally large frame of thin wooden

slats, and on this a person can readily stand, as if in a boat. Not the least remarkable feature of these leaves is their rate of growth. Caspary found the maximum growth in length to be about 1 inch an hour when the leaf is just expanding; the surface increases 4 or 5 square feet in twenty-four hours, and a plant will produce in twenty-one to twenty-five weeks 600 or 700 square feet of leaf-surface. A great development of heat has been observed in the opening flowers of victoria. About 8 P.M., when the anthers are shedding their pollen (in second-day flowers), the stamens may reach and maintain a temperature 10° F. above that of the surrounding air.

Though doubtless known to Spanish traders and missionaries, and certainly of use to savages as food in

germinated and grew vigorously as small seedlings until October, but died in December. In 1848 dry seeds were sent to England from the Essequibo River, along with rhizomes, the latter in Wardian cases; the rhizomes rotted, and the seeds refused to germinate. In 1849 an expedition from Georgetown succeeded in bringing back thirty-five living plants, but these all died. Finally some seeds were sent to Kew from the Demerara River in bottles of fresh water, by two English physicians, Rodie and Luckie. The first sending arrived February 28, 1849, and on November 8 a plant flowered at Chatsworth; the blossom was appropriately presented to Queen Victoria. From this stock *Victoria regia* was distributed to gardens in Europe, Asia, and America. Van Houtte of Ghent first flowered it on the continent,

3931. *Victoria regia*, the giant water-lily of the Amazon.

early times, victoria was first noticed botanically by Haenke in Bolivia about 1801; but he died in the Philippines without recording his discovery. Bonpland, the companion of Humboldt, also saw it near Corrientes, Argentina, in 1819, and in 1825 sent seeds and a full description to Mirbel at Paris. In 1832 Poeppig found it on the Amazon, and gave the first published account of it in Froriep's "Notizen" in November of that year, under the name of *Euryale amazonica*. D'Orbigny saw the plant in 1827 at Corrientes, collected specimens, and sent them with drawings to the Museum of Natural History at Paris. In 1833 he saw it again in Bolivia, and several years later published accounts of his find. Robert H. Schomburgk, finding it again in 1836 on the Berbice River in British Guiana, sent home specimens and figures from which Lindley in 1837 (published in 1838) established the genus *Victoria* and described the species *V. regia*. This name has settled on the northern species, while the one found at Corrientes was named in 1840, by d'Orbigny, *V. Cruziana* in honor of General Santa Cruz, of Bolivia.

The struggle to bring the "queen of water-lilies" into captivity began with Schomburgk. He removed living plants from inland lakes and bayous to Georgetown, British Guiana, but they soon died. In 1846 Bridges obtained seed in the Bolivia locality, province of Moscos, and sent them in a jar of wet clay to England. Out of twenty-five seeds obtained at Kew, three

and Caleb Cope, of Philadelphia, was the earliest successful cultivator in this country. His gardener was the late Thomas Meehan. The first flower opened August 21, 1851. In 1852 John F. Allen, of Salem, Massachusetts, had a plant from seed of Mr. Cope's growing. This plant lived through four summers and matured over 200 flowers.

The next notable importation of seed was sent by Edward S. Rand, Jr., from Para, Brazil, to Mr. Sturtevant, then at Bordentown, N. J. The resulting plants flowered in 1886 and, proving to be slightly different from the former type, were called *V. regia* var. *Randii*. It is doubtless the same form that was described by Planchon as *V. amazonica*, and retained with grave doubts by Caspary. In 1894 Mr. Tricker received from Europe seed of quite another species, which was provisionally named *V. regia* var. *Trickeri*. It is much more amenable to out-of-door culture than the older type, and has received a well-deserved popularity. Specimens grown at Kew from seeds sent by Tricker were regarded simply as garden forms of *V. regia*. Later investigation by Tricker and the writer brought out the fact that the stock came originally from Corrientes, Argentina, and that the plant is truly

the *V. Cruziana* of d'Orbigny. Its far southern habitat (27° south) explains its hardness. At Riverton, New Jersey, seeds that have wintered in an open pond produce plants which flower by the end of August. The large starchy seeds of this species are used as food in Paraguay under the name of *Mais del Agua*, "water-corn." The form of victoria originally introduced from British Guiana had leaves entirely flat until the plant attained considerable size; then a low rim appeared. The leaf was deeply purple-colored beneath. *V. Cruziana* differs markedly from this. *V. regia* var. *Randii* approaches the latter; and Malme's recently described *V. Cruziana* forma *mattogrossensis* approaches *V. regia* in several details. Apparently the two species grade into one another in Matto Grosso, where the tributaries of the Amazon and the Parana rivers inter-lace.

For much interesting information on Victoria, see Hooker, "Botanical Magazine" 4275-4278; Planchon, "Flore des Serres" 6:193-224; Caspary in "Flora Brasiliensis" 4, part 2, page 143 ff. In 1854 John Fisk Allen published in Boston a quarto work (pages 21 by 27 inches) with colored plates, entitled: "Victoria regia, or the great water-lily of America. With a brief account of its discovery and introduction into cultivation: with illustrations by William Sharp, from specimens grown at Salem, Massachusetts, U. S. A."

regia, Lindl. Fig. 3931. Lvs. sparingly pubescent beneath, margins of lvs. of diam. above 40 in., turned up 2-4 in. high: fls. becoming dull crimson the second evening; sepals prickly almost or quite to the tips: prickles of the ovary about $\frac{2}{5}$ in. (10-11 mm.) long: seed elliptic-globose, nearly $\frac{1}{2}$ in. long, less in diam. (7-8 mm. long, $5\frac{1}{2}$ -6 mm. diam.); raphe indistinct; operculum elliptic-orbicular, with the micropyle at its center and hilum at the margin. British Guiana. B.M. 4275 (poor); 4276-78 (incorrect in some details). F.S. 6:595-604. Kerner, Natural History of Plants, pl. xi. Tricker, Water Garden, pls. 1, 2; pp. 21, 35. Caspary, Fl. Brasil. 4, pt. 2, pl. 38, fig. 15 (seed). Var. *Randii*, Hort., has rim of lf. 5-6 in. high, and under side of lf. deeper red: fl. turning to deep crimson on second day. This is the form commonly cult. in American gardens now as *V. regia*. Amazon and its tributaries. A.G. 18:469. Intro. by Sturtevant in 1886.

Cruziãna, d'Orbigny (known in cult. as *V. regia* var. *Trickeri*, and *V. Trickeri*). Lvs. densely villous beneath, upturned margins green, 6-8 in. high: fls. becoming deep red-pink the second evening; sepals prickly only at base, smooth above: prickles of ovary over $\frac{1}{2}$ in. (15-16 mm.) long, crowded: seed subglobose, about $\frac{1}{2}$ in. ($7\frac{1}{2}$ -9 mm.) diam.; raphe stout; operculum elongate-ovate, with hilum and micropyle equidistant from the margin. Parana River and tributaries, Paraguay. Tricker, Water Garden, pl. 1; pp. 51, 55. Caspary, Fl. Brasil. 4, pt. 2, pl. 38, fig. 16 (seed). Gn.M. 1:267. A.G. 19:449. F.E. 10:suppl. Feb. 12 (1898).—Intro. by Wm. Tricker in 1894. Forma *mattogrossensis*, Malme, has low rim on lf. seed very large (8-10 mm. diam.) with broadly oval operculum: sepals either smooth or spiny. Corumba, state of Matto Grosso, Brazil. Acta Hort. Bot. Bergiani, 4:pls. 1-4 (1907).

HENRY S. CONARD.

Cultivation of victorias.

At first *V. regia* was cultivated at a great expense in conservatories and tanks built especially for the purpose. Then it was grown in artificially heated ponds in the open air. The victoria is largely grown in private and public gardens throughout the United States at the present time, together with tropical nymphaeas, and in some cases without artificial heat, but this method of culture is uncertain and often unsatisfactory. *V. Cruziana* is by far the best kind for out-of-door culture. Moreover, it can be grown where *V. regia* fails

to grow, as it revels in a temperature of only 75° to 80°. Its introduction has been of great interest. It has stimulated the culture of aquatic plants in the United States, also in Europe where it is now largely grown.

The *Victoria regia* is now considered of easy culture. Its requirements are heat, light, and a rich mellow loam in abundance. The seed should be sown in February and March. The temperature of the water should range between 85° to 90° F. The seed may be planted in pots or seed-pans and placed in shallow water. A tank 8 to 12 inches deep, having a metal lining, copper preferred, is very serviceable for seedlings and young plants. Where sufficient heat is not attained from the heating pipes, an addition can be made by the use of an oil-lamp. It is altogether unnecessary and unnatural to file or chip the seed to assist or hasten germination. The seedlings will appear in about twenty days, though occasionally a few may appear in ten days. These should be potted off singly into $2\frac{1}{2}$ -inch pots, using fine loamy soil. The water temperature for the young plants should be the same as directed for the seed-pots. As soon as the young plants acquire their first floating leaf they will doubtless be benefited by repotting. From the very beginning, as sprouted seeds, they should be kept steadily growing, repotting at intervals, until they are planted out in their summer quarters. As the young plants advance they will require more space, so that the leaves are not crowded and overlap each other.

To raise plants of *V. Cruziana* (*V. Trickeri*) is altogether a different matter. The seed will not germinate in a high temperature; 65° to 70° is sufficient. The seed may be sown in February, but there is great uncertainty as to how long one must wait for the seedlings to appear, and also as to what percentage of seeds will germinate. As soon as the seedlings appear they should be treated like seedlings of *V. regia*, except as to temperature, which should be kept as above stated for seedlings and small plants, and as the season advances may be raised to 75° to 80°. The rationality of the cool treatment here advocated is borne out by the fact that early in June quantities of seedlings appear in the pond in the open where a plant has grown the preceding season, the seed having remained in the pond during the winter. Planting in summer quarters may be done early in June or whenever it is safe to plant out tender nymphaeas, that is, when the pond is not artificially heated. When it is desired to plant out in unheated ponds it is not safe to plant before the middle or latter end of June. The conditions of the weather, earliness or lateness of the season, locality, and the like, must all be taken into account.

The best results are to be obtained from an artificially heated pond, or pits in the pond specially constructed to start the victorias, these pits to be heated by hot water or steam and covered with frames and sashes. By this method plants may be set in their summer quarters early in May and heat applied until the middle of June, or rather a temperature of 85° maintained until the advent of summer weather.

Very gratifying results are obtained when the victoria is grown under glass, as it is thus grown in several places in the United States, notably at Schenley Park, Pittsburgh, and Allegheny Park; also at "Grey-stone," the estate of Samuel Untermyer, Yonkers, New York, also at many notable gardens in Europe. Plants grown under glass usually attain to larger dimensions, as they are protected against climatic changes and the elements, besides enjoying more of a tropical atmosphere. There is more than one disadvantage, however. Setting aside the costly construction, labor, and so on, it is by no means inviting even on a warm day to spend many minutes in such a structure. Compare this with a natural pond and its surroundings and a cool shady seat where these gorgeous plants may be viewed at leisure.

Whether grown indoors or out, these plants are only

annuals, and seedlings are of necessity raised every spring. They form no tubers as do the tender nymphs, or rootstock as do the hardy nymphs.

Few, if any, insects are troublesome on these plants. The worst is the black-fly or aphid. The use of insecticides should not be resorted to, as they are most likely to damage the foliage. The safest remedy is to introduce a colony or two of the well-known "lady bug." They and their larvæ will soon clear off all the aphides without any injury to the plant. WM. TRICKER.

VÍGNA (Dominic Vigni, Paduan commentator on Theophrastus in the seventeenth century). *Legumindæ*. Herbs grown mostly for the seeds and fodder; the cowpea group.

The usual cultivated species of *Vigna* are annual bean-like rambling vines with 3 rhomboid-ovate stalked lfts., the lateral ones unequal-sided, the petioles long:

3932. *Vigna strobilophora*. ($\times \frac{1}{2}$)

fls. bean-like, white, pale to violet-purple and pale yellow, borne 2 or 3 together on the summit of a long axillary peduncle: pods slender, straight, or slightly curved, a few inches to $3\frac{1}{2}$ ft. long; seeds small, nearly round to kidney-shaped, bean-like, white or dark, self-colored or variously mottled, usually with a different color about the eye.—Species 60 or more, tropical. The species show great variation in stature and growth-habit, and particularly in the color of the seeds. The genus may be distinguished from *Phaseolus* by the fact that the keel is bent inward at right angles but is not coiled. *Vigna* resembles *Dolichos* in having a similar keel but differs from it in the form and position of the stigma. In the former species this is lateral, occupying a position just beneath the apex of the style and above the line of pubescence which extends up the inner face of this organ. Just opposite the stigma the apex of the style is bent backward and prolonged into a beak. The stigma in *Dolichos*, on the other hand, is terminal or merely oblique. The prolonged beak of the style is also absent. *Vigna* may be further distinguished

from *Dolichos* in the shorter petioles of the first pair of aerial lvs. In *Vigna* these are about $\frac{1}{4}$ in. long or shorter, whereas in *Dolichos* they are 1 in. long or longer.

Three species of *Vigna* are in common cultivation: the cowpea, *V. sinensis*; the catjang, *V. Catjang*; and the asparagus bean, *V. sesquipedalis*. The asparagus bean (*V. sesquipedalis*) can be used as a forage plant for stock, or the green pods may be cooked as a snap bean since they are more tender and brittle than those of the cowpea or catjang. This species is little grown, however, due to a lack of productivity, except as a curiosity or novelty. The nomenclature of the cultivated varieties of the cowpea and catjang is almost hopelessly confused. Piper enumerates 220 agricultural varieties of the former and 50 of the latter. Formerly the name cowpea was restricted to the buff-colored or clay-pea, but it is now commonly used generically; it is an Americanism. Common generic terms now in use in the South are "black-eyed pea" and "corn-field pea." While the cowpea and the catjang are now employed mostly for animal food and green-manuring, the pea itself is a good human food and has been so used for many years. For table use the peas are best gathered when the pods first begin to change color; however, they are most extensively used from the dry ripe pods. As long ago as 1855 an excellent essay on cowpeas was written by Edmund Ruffin ("Essays and Notes on Agriculture," Richmond, 1855). Piper (Bulletin No. 229, Bureau of Plant Industry, United States Department of Agriculture) describes these three species as follows:

sesquipedalis, W. F. Wight (*Dolichos sesquipedalis*, Linn.). Seeds elongated kidney-form, 8–12 mm. ($\frac{1}{8}$ – $\frac{1}{2}$ in.) long, their thickness much less than their breadth; pods pendent, much elongated, 1–3 ft. long, fleshy and brittle, becoming more or less inflated, flabby and pale in color before ripening, and shrinking about the widely separated seeds when dry. S. Asia.

Cátjang, Walp. Seeds small, usually oblong or cylindric and but slightly kidney-shaped, 5–6 mm. ($\frac{1}{8}$ – $\frac{1}{4}$ in.) long, nearly or quite as thick as broad; pods small, not at all flabby or inflated when green, mostly 3–5 in. long, erect or ascending when green, remaining so when dry or at length becoming spreading or even deflexed. Probably S. Asia.

sinensis, Endl. Seeds mostly 6–9 mm. ($\frac{1}{4}$ – $\frac{3}{8}$ in.) long, varying from subreniform to subglobose; pods 8–12 in. long, early becoming pendent, not at all flabby or inflated when green. Probably Cent. Afr.

Some species of *Vigna* are useful for ornament. *V. strobilophora*, Robs., from Mex. (Fig. 3932), is said by Pringle (G.F. 7:155, from which Fig. 3932 is reduced) to have abundant fls. that rival those of the wisteria in beauty. It is a twining woody vine climbing to tops of trees and shrubs: st. slender and flexuous, pubescent; lfts. 3, ovate, acuminate, entire, rounded at base, $2\frac{1}{2}$ in. long; fls. in dense axillary peduncled racemes, blue-purple, standard orbicular, slightly retuse, with 2 small appendages at base; bracts large, closely imbricated. *V. vexillata*, Benth. (*Phaseolus vexillatus*, Linn.), widely spread in the tropics and warm parts of Old World, is intro. in S. Calif.: woody perennial with pink fls., the rootstock tuberous, hairy; lfts. usually ovate-lanceolate to narrow-lanceolate, entire, 2–4 in. long; fls. 2–4 in a cluster on summit of peduncle; standard nearly 1 in. across, reflexed: pod 3–4 in. long, nearly cylindrical. GEO. F. FREEMAN.

VIGUIÈRA (Dr. A. Viguier, botanist of Montpellier, France). *Compósitæ*. About 60 or 70 species of herbaceous or somewhat shrubby plants, found in the warmer parts of the world, especially Amer. The following is a native of Low. Calif. and is offered in S. Calif., but is little known otherwise. It is a tall bushy

plant with silvery foliage and small yellow fls. like single sunflowers, but borne in ample corymbs. Rays fertile, or more often sterile, in wild plants sometimes wanting; pappus of 2 chaffy awns: achenes usually pubescent. The plant blooms both winter and summer.

tomentosa, Gray. Shrub or branching subshrubs: lvs. opposite, subcordate, serrate, tomentose on both sides, 3-5 in. long: heads corymbose: achenes villous, with 2 long awns and many small scales.

N. TAYLOR.†

VILLAGE IMPROVEMENT: *Planting*, Vol. V, p. 2658.

VILLARÈSIA (named for Matthias Villarez, a Spanish botanist). *Isacináceæ*. Evergreen tall climbing trees or shrubs, adapted to the warmhouse: lvs. alternate, oblong, entire or spinulose-dentate, thick, leathery, shiny: cymes small, head-like, arranged in axillary or terminal racemose panicles or racemes: fls. white, hermaphrodite or polygamous; calyx 5-parted; petals 5, ribbed inside; stamens 5, disk inconspicuous; ovary 1-celled: drupe ellipsoid.—About 13-15 species, distributed in the islands of the Pacific, Trop. Austral., Indian Archipelago, and Brazil and Chile.

grandiflora, Fisch. Tree, smooth with subangular branches: lvs. sparse, petioled, coriaceous, ovate-lanceolate, narrowed toward the base, apex acuminate, greenish above, paler beneath: panicles terminal, clustered: fls. sessile, small, white; calyx tubular-campanulate, lobes 5, ovate; petals 5, spreading, lanceolate. Brazil. Gt. 6:181.

mucronata, Ruiz & Pav. (*İlex gongónha*, Mart.). Tree, usually 40 ft. high, rarely 50-60 ft.: lvs. short-petioled, ovate or elliptic-oblong, apex spinulose, leath-

apex 4-valved.—About 10 species, S. Afr. and Austral. **V. reniformis**, R. Br. (*Menyanthes exaltata*, Sims. *M. sarmentosa*, Sims). From 6 in. to 3 ft. high: lvs. in a dense tuft on long petioles, ovate, orbicular or reniform, more or less cordate, entire or slightly sinuate-dentate, mostly 1-2 in. long: fls. yellow; corolla $\frac{3}{4}$ -1 in. across, lobes copiously fringed or bearded at the base inside. Austral. B.M. 1029; 1328. R.H. 1909, p. 125.

VIMINÀRIA (Latin, *vimen*, a slender twig or withe, alluding to the branches). *Leguminosæ*. Shrub, with rush-like branches, adapted to greenhouse cult.: lvs. alternate, reduced to long filiform petioles or rarely 1-3-foliate: fls. small, orange-yellow, arranged in terminal racemes; calyx-teeth short, equal; petals rather long-clawed, standard suborbicular, wings oblong, keel incurved, equaling the wings; stamens free; ovary subsessile, 2-ovuled: pod sessile, ovoid-oblong, rather indehiscent.—One species, Austral., little known to horticulturists.

denudata, Smith. The name LEAFLESS RUSH-BROOM has been proposed for this. Leafless yellow-fl. shrub, attaining 10-20 ft., formerly cult. in European greenhouses as a small tender shrub: lvs. 3-8 in. long: pod 2-3 lines long. Austral. B.M. 1190. P.M. 14:123.—Offered in S. Calif.

F. W. BARCLAY.

VÍNCA (*pervinca*, old Latin name of periwinkle, used by Pliny). *Apocynaceæ*. Erect or procumbent or trailing herbs or subshrubs, some used for bloom in the flower-garden, others for decorative foliage in the greenhouse and in window-boxes and others for permanent ground-cover out-of-doors.

Leaves opposite: fls. axillary, solitary, rather large; calyx 5-parted, not glandular, lobes narrow, acuminate; corolla salver-shaped, tube cylindrical, lobes 5, large,

3933. *Vinca minor*, the common periwinkle, or running myrtle. (Natural size)

ery, dark green, shining above, paler and dull beneath: fls. 5-merous, in solitary shortly pubescent thyrses, terminal or in the upper axils, yellowish white; sepals wide elliptic or nearly orbicular; petals elliptic-oblong; ovary by abortion 1-celled: drupe ovoid. Chile. B.M. 8376.—Prop. by cuttings. Rare in cult.

F. TRACY HUBBARD.

VILLÁRSIA (named for Dominique Villars, 1745-1814). *Gentianaceæ*. Marsh-loving herbs, suitable for greenhouse cult.: sts. simple and leafless or somewhat branched and few-lvd.: lvs. radical, long-petioled, entire or irregularly sinuate-dentate: cymes usually many-fl., sometimes laxly paniculate, sometimes corymbosely congested or capitate and involucrate: fls. yellow or white; calyx 5-parted or deeply 5-cleft, segms. lanceolate; corolla broadly campanulate or rather rotate; stamens 5: caps. 1-celled, subglobose,

twisted, overlapping to the left; stamens included, above the middle of the tube; disk none; ovary 2 distinct carpels, glabrous: follicles 2, erect or divergent, narrowly cylindrical.—About 12 species, Medit. region, Trop. Amer., India, and Madagascar.

One of the commonest and best plants for covering the ground in deep shade, especially under trees and in cemeteries, is *V. minor*. It is a hardy trailing plant with shining evergreen foliage and blue salver-shaped five-lobed flowers about an inch across, appearing in spring or early summer. It forms a dense carpet to the exclusion of other herbs. It thrives best in moist half-shaded positions, but will grow in the deepest shade even in poor soil, especially if it is stony. It is a capital plant for clothing steep banks, covering rocks, and carpeting groves. It can be planted successfully on a large scale any time from spring to fall during mild or

rainy weather. It is propagated by division or by cuttings, as seeds very rarely mature. The periwinkle will live in city yards under trees where grass will not thrive. *V. minor* is the commonest and perhaps most variable species. Varieties with white, purple, and double flowers are kept in most nurseries, as also a form with variegated foliage. *V. major* is larger in all its parts than the common periwinkle and not so hardy. It is well known to florists. A variegated form of it is seen in nearly every veranda-box in the country. *V. rosea* is a tender plant of erect habit which is used chiefly for summer bedding. It grows about a foot high and has rosy purple or white flowers with or without a reddish eye, and often 2 inches across. The plants bloom continuously from the time they are set out until frost. It can be grown in large masses for public parks with somewhat less expense than geraniums. Mr. Stromback, head gardener of Lincoln Park, Chicago, has recorded his experience with *V. rosea* in Florist's Review 1:141 as follows: "The seed is sown in January or February in flats of sandy soil in a temperature of 65° to 70°. When the seedlings show the second leaf, they are pricked out about an inch apart in trays of the same soil, and when the little plants have five or six leaves they are potted into 2-inch rose-pots, and later shifted to 3-inch pots. The majority are bedded out from the 3-inch pots. The soil of the bed should be a sandy loam if possible, and the plants will not do well in a very heavy soil. In bedding, set the plants about a foot apart. They require more water than a geranium, and when the bed is watered it should be given a good soaking and then let alone for a few days. The plants require no trimming." The amateur will find *V. rosea* a satisfactory window-plant that can be grown with little trouble from seeds started as late as April, but of course such plants will not bloom as early as the bedding stock propagated in January or February. *V. rosea* is the largest-flowered vinca, and it seeds freely. (Wilhelm Miller.)

A. Plants trailing, herbaceous, hardy or nearly so, only the short flowering sts. ascending: fls. mostly blue or white.

B. Foliage evergreen.

C. Lvs. ovate or oblong-ovate: corolla-lobes wedge-shaped; calyx glabrous.

minor, Linn. COMMON PERIWINKLE. BLUE, RUNNING, or TRAILING MYRTLE. Fig. 3933. Hardy evergreen, trailing herb: fl.-sts. erect, sometimes nearly a foot high: lvs. ovate, oblong-ovate, or elliptic-lanceolate, not more than 1½ in. long, glabrous, petiole very short with 2 glands at the top: fls. lilac-blue; calyx-lobes lanceolate, rather obtuse; corolla-lobes cuneate, obtuse and truncate. Eu. G. 2:64.—Common in all country gardens and running wild in cemeteries and shady places. Some of the horticultural varieties are: *Var. álba*, Hort., which has single white fls. *Var. álba pléna*, Hort., with double white fls. *Var. álba variegata*, Hort., is a form with variegated lvs. and single white fls. *Var. argétea variegata*, Hort., has the lvs. silvery variegated. *Var. atropurpúrea compácta*, Hort., has single dark purple fls. *Var. aúrea*, Hort., has been in the trade, a form with golden foliage. F.E. 33:479. *Var. aúrea variegata*, Hort., has golden variegated lvs. *Var. cærulea*, Hort. (*V. cærulea*, Hort. *V. cærulea minor*, Hort.), is a form with bright blue, single fls. There is also a form known as *V. cærulea argétea marginata*, Hort., which has the lvs. margined with silvery white. *Var. fióre-pléno*, Hort., probably the same as *var. pléna*. *Var. pléna*, Hort., has double fls., otherwise like the type. *Var. purpúrea pléna*, Hort., has double purple fls. Gn. 50:102. *Var. rôsea*, Hort., has single rosy fls. *Var. rôsea fl.-pl.* Hort., is like the last but double-fl'd. *Var. variegata*, Hort., is a variegated-lvd., blue-fl'd. form offered in the trade. *V. elegantissima álba*, Hort., and also "The Bride," a form with white fls. which are pink-centered belong to this species.

cc. Lvs. subcordate-ovate: corolla-lobes obovate.

diffórmis, Pourr. Subshrub, evergreen and dwarf: branches prostrate and leafy; flowering shoots ascending: lvs. ovate, base rounded or shortly cuneate, apex acutish or obtuse, 1¼–2¾ x 1–1¾ in., glabrous, petioled: fls. solitary in the uppermost axils, 1 in. or more across, pale lilac-blue; sepals linear; corolla-segms. obliquely obovate. S. Eu., N. Afr. B.M. 8506.—Rare in cult.

máior, Linn. Sterile sts. reclining; flowering sts. rather erect: lvs. subcordate-ovate, rather obtuse, ciliate, shining, 2–3 x 1–2 in.: fls. blue; calyx-lobes narrowly linear, ciliate; corolla-lobes obovate, very obtuse. Eu.—This species is larger throughout than *V. minor*. It is much used, especially the variegated forms, for veranda-boxes and hanging-baskets. *Var. elegantissima*, Hort., is a showy form with the lvs. margined and blotched with yellowish white. Common form among the florists and easily prop. by cuttings. *Var. reticulata*, Hort., is offered in the trade. *Var. variegata*, Hort., is offered in the trade. G. 27:330.

BB. Foliage deciduous or less evergreen.

herbácea, Waldst. & Kit. Hardy trailing glabrous herb, which usually loses its lvs. in winter: lvs. elliptical or lanceolate, rather obtuse, margins revolute; petiole very short: fls. more purple than the other species; calyx-lobes narrowly lanceolate, acuminate; corolla-lobes obovate, oblong-obtuse. E. Eu., Asia Minor. B.M. 2002. B.R. 301.

AA. Plants erect, subshrub, tender: fls. rosy or white.

rôsea, Linn. MADAGASCAR PERIWINKLE. Fig. 3934. Tender erect everblooming plant, somewhat shrubby at the base: lvs. oblong, narrowed at base, veiny; petiole glandular at the base: fls. with a very small orifice, rosy purple or white, the latter with or without a reddish eye; calyx-lobes linear, corolla-lobes dimidiate-obovate, mucronulate. Cosmopolitan in the tropics. Gn. 36, p. 455; 43, p. 389. V. 13:49; 16:49. B.M. 248. F.R. 1:141. G. 11:197; 14:333; 37:205.—This is commonly called the "Madagascar periwinkle," but *V. rosea* is probably not native to the Old World, while the only species of Vinca that is really native to Madagascar, viz., *V. lancea*, is not in cult. The plant is sometimes called "Cape periwinkle" and "old maid." The three main types should be known as *V. rosea*, *V. rosea* var. *alba*, *V. rosea* var. *oculata*, the latter being a white fl. with pink or red center. As a matter of fact, these appear in American catalogues as *V. alba*, *V. alba pura*, *V. alba nova*, *V. oculata*, and *V. varius*, the last being a trade name for seed of mixed varieties. *Var. delicata*, Hort., is a trade name.

V. acutiloba, Hort., is a trade name for a white-fl'd. form, closely related to *V. major*.

F. TRACY HUBBARD.†

VINCETÓXICUM (compound meaning to conquer or subdue poison, alluding to supposed virtues). *Asclepiadaceæ*. By some combined with *Cynanchum* (which see), but differing in anthers having only short scarious tips and bearing horizontal rather than suspended pollinia. There are about 75 species, all in Amer., mostly

3934. *Vinca rosea*.
(× nearly ½)

in warm or tropical parts: they are twining or trailing woody or perennial herbaceous vines, with opposite cordate simple lvs. and small greenish or purplish fls.: corolla campanulate or rotate, deeply 5-cleft and the parts sometimes reflexed; crown small, mostly ring-like or cup-like and thereby differing from the awned crown-lobes of *Gonolobus* (Definition of *Gonolobus*, p. 1356, to be amended): follicles thick, pointed, mucate or ribbed or both. Several species are native in the U. S. from Pa. and Va. southward, but apparently they are not in cult. The mosquito plant or cruel plant, sometimes named in this genus, is here treated as *Cynanchum acuminatifolium*.

VINES: *Planting*, Vol. V. (Index p. 2657.)

VIOLA (classical name). *Violææ*. **VIOLET**. **PANSY**. Usually perennial herbs with attractive spring or early summer bloom, and well adapted for colonizing in grounds and one species for forcing; in the pansy group, many species are handsome winter annuals or biennials; and in the Andes and the Sandwich Islands, and in southern Europe shrubby species occur, but they are scarcely cultivated. See *Violet*.

Either stemless, bearing lvs. and 1-fl. scapes from the crown of the rootstock, or stemmed with manifest internodes between the lvs., from the axils of which arise 1-fl. peduncles: fls. usually of two kinds, those of spring with showy petals (Fig. 3935) and those of summer with petals rudimentary or lacking—fls. never opening but self-pollinated within the closed calyx (cleistogamous). (Fig. 3936.) The showy fls. of spring are 5-merous as to sepals, petals, and stamens, irregular and novel in structure as though contrived to prevent self-pollination; sepals nearly similar, persistent on the fr.; the lower petal of the nodding fl. spurred, the other 4 in 2 unlike pairs, the petals in each pair symmetrically alike; stamens short and included, the anthers more or less coherent in a ring about the style, 2 of

3935. Structure of the flower of *Viola papilionacea*.

them with nectar-bearing appendages projecting backward into the spur: fr. a caps. with several (up to 60) obovate seeds; caps. when ripe splitting into 3 boat-shaped valves with thick rigid keels; as the thin sides of the valve dry and contract the seeds within are more and more pinched, until they fly out, one or two at a time, to a distance often of 9 ft.: later cleistogamous fls. in some of the stemless species not growing in wet ground are borne on short horizontal peduncles concealed under soil and leaf-mold until the seeds are ripe, when the peduncle lengthens and lifts the caps. into the air, where it scatters

its seeds as did the earlier caps. (Fig. 3936.) See *Rhodora*, vol. vi, plate 50, for cleistogamous fls. and frs. of 6 other species.—Probably 300 species widely distributed in the N. and S. Temp. zones of both the Old World and the New, of which about 80 species are native to N. Amer. north of Mex. The classification of the wild violets into species was for many years a perplexing task, because students of the genus failed to recognize the fact that all closely allied species freely hybridize in nature. But in 1900 the important discoveries of Mendel became generally known to biologists, and gave rise to the new science of genetics. With a better understanding of the laws of inheritance that determine the characters of offspring from unlike parents, it is practicable in a genus like *Viola* to discover what forms are proper species

and what are hybrids or the offspring of hybrids. Some of the tests employed by the specialist in *Viola* may be briefly indicated as follows: (1) The hybrid is notably intermediate in its characters between two well-known species found in the same vicinity. (2) The hybrid usually shows great impairment of fertility, 50 to 100 per cent of the ovules being aborted, but a marked increase in vegetative vigor. (3) The pollen-grains of

3936. The two kinds of violet flowers,—the common showy flowers at the right (natural size), and the cleistogamous flower at a, its immature pod at b ($\times \frac{1}{2}$).—*Viola papilionacea*.

most hybrids are seen under the microscope to be largely shriveled and functionally impotent. (4) The hybrid is found to be unstable in sexual reproduction; that is, the offspring of the self-fertilized hybrid are more or less unlike the parent and unlike each other; the offspring of pure species are not thus unlike.

By experimental cultures extending over twelve years, the writer has ascertained the existence of about eighty spontaneous hybrids among the violets of eastern North America—that is, more hybrids than there are pure species. In Wilhelm Becker's systematic treatise on the violets of Europe (published in 1910), eighty-three hybrids are reported among the one hundred and two species there recognized. Any reader caring for the details of the work on American violets will find a dozen or more papers in *Rhodora* and in the *Bulletin of the Torrey Botanical Club* (1904–1913); see also *Science*, June, 1907, and *American Naturalist*, April, 1910.

Violets are easily grown if an effort is made to imitate the conditions under which they naturally occur. They usually require abundant moisture and partial shade, and a light covering of fallen leaves or evergreen boughs in winter. The habitats are various: some are wood species, others from bogs or borders of springs and brooks; still others, especially in the western United States, inhabit dry plains, remaining dormant during the drought of summer. They are propagated readily by division if the plant is fairly large, and in some nine of the American species by runners. Sometimes seeds are used, but not commonly. However, species of the northeastern United States germinate readily in April, if fresh seed is sown in autumn in boxes and exposed, covered with burlap, to the freezing cold of winter. Many species, that grow mostly to single stems in the wild, make large clumps under favorable conditions in the garden (Fig. 3942). But few of the native violets are grown to any extent as garden plants. *V. pedata*, the bird's-foot violet, a most attractive species, is

sometimes cultivated, as is the hardy grower, *V. papilionacea* (Fig. 3936). A partial albino of this, the petals white with a large blue center, is grown in southern gardens as "the confederate violet." It has been published as *V. Priceana*, the type coming from Bowling Green, Kentucky; but it is perfectly hardy in the North, and multiplies abundantly. Many hybrids of *V. sororia* and of *V. pedatifida* are also hardy, some with violet flowers, others with white flowers, often fifty or more blooming at once in a large clump.

No attempt is made here to describe all the native species, as they are so numerous and so rarely horticultural subjects. For any desired information regarding them the reader is referred to the most recent editions of Gray's "Manual," of Britton & Brown's "Illustrated Flora," or of Small's "Flora of the South-eastern United States," the treatment of *Viola* in all three works being by the present writer. However, as a matter of record, a list of those that are or have been offered in the trade is here given, and references made to illustrations found in horticultural magazines. With the recent critical studies of *Viola*, it is found that two or more species were sometimes comprised under a single name; it is therefore difficult, in some cases, to determine what plant may be in cultivation under one of the older names. It is now considered that the European *V. canina* is not indigenous in America; probably the plant listed under that name is *V. conspersa*.

A. Species of exotic origin, comprising the florist's violets and the pansy.

B. Plant stemless, the peduncles arising directly from the base or crown.

c. Style truncate at apex.

1. *hederacea*, Labill. (*Erpetion reniforme*, Sweet. *E. hederaceum*, *E. petiolare*, and *E. spathulatum*, Don). AUSTRALIAN VIOLET. Tufted, and creeping by stolons, glabrous or pubescent: lvs. reniform or orbicular or spatulate, small, entire or toothed, usually not equaling the scapes: fls. small, usually blue, sometimes white, the spur almost none. Austral. G. 35:35.—Offered in S. Calif.

cc. Style terminating in a slender hooked beak.

2. *odorata*, Linn. SWEET VIOLET. Fig. 3937; also Figs. 3947-49. Tufted, somewhat pubescent, producing long prostrate stolons flowering the second year: rootstock short: lvs. cordate-ovate to reniform, obtusely serrate; stipules ovate-lanceolate, acuminate, the fringed border usually not glandular: fls. deep violet, rarely rose or white, fragrant, the spur nearly or quite straight and obtuse. Eu., Afr., and Asia.—It runs into many forms varying in stature, size of fls. and color. There are double-fl. forms. It is the parent of florist's violets. Fig. 3937, from G.C. III. 21:248, represents

var. *sulfurea*, "reported to be a native of the south of France, and bears dull sulphur-coloured flowers." *V. californica* of gardeners on the Pacific coast is only the sweet violet of Eu. For cult., see *Violet*.

3. *cyanea*, Celak. Stemless, stoloniferous: lvs. broadly cordate-ovate, crenate, bright green, glabrate and shining after flowering; stipules lanceolate, long-acuminate, fimbriate: pedicels 2-4 lines long, about equaling or slightly shorter than the petioles after flowering; sepals oblong, obtuse, with short appendages which are rotundate and appressed to the pedicel; corolla medium-sized; petals sky-blue-white below the middle, lower petal emarginate, the others about as long, scarcely emarginate; spur conical, rather straight; ovary short-conoid, very smooth. Eu.

Var. *perfimbrata*, Borb. (*V. bosnana*, Wiesb. *V. russica*, Hort.). Stolons short, rather thick: lvs. broadly cordate-ovate, vivid green, at flowering-time glabrous and shining; stipules lanceolate, long-acuminate, long-fringed, nearly glabrous: fls. less fragrant than in *V. odorata*; petals a cornflower-blue above the middle, white below. Lower Austria and southeastward. G. 36:362.

4. *alba*, Bess. Stolons long, ascending, appearing in spring and sometimes bearing fls. the same season: lvs. nearly triangular, cordate, with deep and broad

3937. *Viola odorata*. (× $\frac{3}{4}$)

sinus, obtuse; stipules lanceolate, long-acuminate, with glandular fringe: fls. fragrant, usually white, but sometimes in various shades of violet and rose. Cent. and S. Eu.

BB. Plants with evident sts., more or less branching, the peduncles arising some distance above the ground or crown.

c. Style slender throughout.

5. *silvestris*, Reichb. (*V. silvatica*, Fries). Sts. reclining and ascending, glabrous or slightly pubescent: lvs. deeply cordate or nearly reniform, short-pointed or obtuse; stipules linear-lanceolate, fringed-toothed, several times shorter than the petiole: sepals lanceolate, acuminate; petals oblong, narrow, not overlapping. Widely distributed in Eu. G.W. 13:73.

6. *elatior*, Fries. Sts. tall and straight: lvs. lanceolate from a rounded or cordate base, when young with appressed pubescence; the middle stipules as long or

longer than the petiole, the upper much surpassing it: corolla large, pale blue. Cent. Eu. and southeastward.

cc. *Style much enlarged upward into a globose hollow summit.*

7. *calcarata*, Linn. (*V. valdèria*, Huter). Rootstock producing filiform creeping branches: st. simple, 4 in. high: lvs. ovate, or the upper oblong to lanceolate, crenate; stipules nearly or quite pinnately divided: spur as long as the large violet corolla. Alpine region of Cent. Eu. G.W. 12:709. Gn. 62, p. 97.

3938. *Viola cornuta*. ($\times \frac{1}{2}$)

medium size, the petals violet or yellow; sepals oblong-lanceolate, acute, shorter than petals; spur exceeding calyx appendages. Macedonia to Asia Minor.

9. *Munbyana*, Boiss. & Reut. Another of the *V. calcarata* kind: plant about 1 ft. high, with long internodes, very short-pubescent: lvs. cordate-ovate, obtuse, crenate, glabrous or the margin ciliate, the upper ones somewhat acute; stipules pinnatifid: fls. 1-3, the petals violet or yellow; sepals lanceolate; spur straight, attenuate at the end, about twice longer than the calyx. Algeria.

10. *lutea*, Huds. Plant persisting by filiform prostrate branching sts.: stipules digitately much divided, middle division linear and enlarged; sepals oblong-lanceolate, obtuse or short-pointed; spur hardly longer than the appendages of the calyx; petals yellow, rarely the two upper or all of them violet. Cent. Eu. and Great Britain.

11. *cornuta*, Linn. HORNED VIOLET. BEDDING PANSY. Fig. 3938. Plant tufted, glabrous or nearly so, producing evident sts. with long peduncles in the lf.-axils: lvs. subcordate-ovate and usually acuminate, crenately

3939. *Viola cornuta* var. *Papilio*. ($\times \frac{1}{2}$)

serrate; stipules triangular, large, coarsely dentate: fls. normally violet, the petals obovate-obtuse, standing well apart, the spur slender, acute, shorter than the petals. Spain and the Pyrenees. B.M. 791. G. 32:417. Gn. 73, p. 385.—Frequently seen in gardens and much prized for its large bright fls. Good for spring bloom. Hardy. There are several colors. Var. *alba*,

Hort. Gn. 78, p. 449. Var. *purpurea*, Hort. G.M. 52: 886. Var. *Papilio*, Hort. (Fig. 3939) has very large fls., violet in color, with small dark eye. Var. *admirabilis*, Hort., a garden group of various colors, is probably a hybrid offshoot of this species. *Manne Queen* is a form of this species.

12. *tricolor*, Linn. PANSY. HEARTSEASE. Fig. 3940; also Figs. 2748, 2749. Glabrous or nearly so, the sts. becoming long and branched: basal lvs. cordate or round-cordate, those of the st. becoming ovate-oblong or lanceolate, all stalked and crenate-dentate; stipules large, pinnately parted toward the base: fls. large, usually about three colors represented (except in high-bred self varieties), the spur usually twice as long as the appendages of the calyx. Eu. G.Z. 27:1. R.B. 38:137.—When strayed from cult., the fls. become small and lose the markings characteristic of the high-bred pansies. A small-fl. field form, becoming common, is the European *V. arvensis*, Murray. A similar but more delicate species, distinguished by petals longer than the calyx, *V. Rafinesquii*, Greene (*V. tricolor* var. *arvensis*, American Auth., not DC.), is indigenous to the U. S. from N. J., southward and westward to Texas and Colo. For cult., see *Pansy*

AA. *Species native in the U. S. and Canada, not domesticated but sometimes planted from the wild.*

B. *Plants stemless.*

C. *Petals normally violet or purplish.*

D. *Lvs. more or less dissected.*

13. *pedata*, Linn. BIRD-FOOT VIOLET. Rootstock short and erect: plant glabrous: lvs. pedately 3-5 parted or -cleft, the segms. usually 2-4 cleft or -toothed near the apex: petals all beardless. Sandy soil, Mass. and Minn. to Fla.; a handsome species. G.Z. 11:144.

Gn. 65, p. 383. G. 13:373; 22:68.—In the typical form the 2 upper petals are dark violet, the 3 lower pale lilac; the concolorous form is by far the more common. A form with petals nearly white is known as var. *alba*.

14. *palmata*, Linn. Fig. 3941. Rootstock stout, usually oblique rather than erect: first lvs. in spring sometimes less divided but later lvs. palmately 5-11-lobed or -parted, middle segm. largest, all of them variously toothed or cleft: fls. violet-purple, about $\frac{1}{2}$ -1 in. across; lateral petals bearded; sepals rather blunt, ovate-lanceolate; produces cleistogamous fls. on prostrate peduncles. Woodlands, Mass. to Minn. and to Fla.

15. *pedatifida*, Don. Rootstock short and erect: lvs. palmately multifid, primarily 3-parted or -divided, each segm. again 3-cleft or -parted into linear subdivisions, these often further cut into 2-4 lobes: fls. showy, violet, on scapes surpassing the lvs.; produces cleistogamous fls. with yellowish caps. on erect peduncles. Prairies, Ohio northwestward and south-westward.

DD. *Lvs. lanceolate or oblong-lanceolate.*

16. *sagittata*, Ait. A small species, with erect short rootstock, usually glabrous: mature normal lvs. lanceolate or oblong-lanceolate, hastately or sagittately toothed

3940. *Viola tricolor*. ($\times \frac{1}{2}$)

or incised at the base; earlier and later lvs. more deltoid and often only crenate at base; fls. violet-purple; sepals narrow-lanceolate, acute. Banks and fields, Mass. to Minn. and southward.

DDD. *Lvs. cordate-ovate to cordate-reniform.*

17. *papilionacea*, Pursh (*V. cucullata* of older Manuals). Figs. 3935-6, 3942. Commonest and most variable violet in the N. E. U. S. A robust plant, with a strong branching horizontal rootstalk, 3-6 in. high: lvs. deltoid-ovate to cordate-ovate, not lobed, bluish, serrate, the long petiole somewhat pubescent: fls. normally deep violet but white or greenish yellow in the center; outer sepals ovate-lanceolate; petals narrow; spurred petal often narrow and boat-shaped; cleistogamous fls. usually underground but caps. erect. *V. Priceana*, Pollard, is probably a form of this, with white blue-centered fls. Ky. See remarks on p. 3473. — Besides albinos there are striped and pied forms now in the trade known as vars. *striata*, *picta*, and *variegata*, Hort. All forms are easily colonized in the garden. G.M. 57:313. G. 3:323 (both as *V. cucullata*). Gt. 1:194.

18. *sororia*, Willd. Much like No. 17, but petioles and lower surface of lvs. villous-pubescent: a sturdy grower, in pubescence, shape of lf., and color of fl. resembling the European *V. odorata*, whence named by Willdenow in 1806 the "sister violet." (Latin *soror*, a sister.) Woods and moist meadows and about buildings, Que. to Minn. and southward.

19. *pratincola*, Greene. A prairie species of the Middle West, from Ind. to Minn. and Colo.; like *V. papilionacea*, but less robust, and often united with that species.

petals violet-purple but of a lighter shade than in No. 17, the petals broadly obovate.

20. *septentrionalis*, Greene. Scapes and lvs. more or less hirsutulous: lvs. ovate to reniform, cordate at base, somewhat attenuate but blunt at the apex, crenate-toothed and ciliate, the petioles slender: fls. large, of a rich violet-purple (rarely white or whitish); 3 lowest petals villous at base; sepals ovate and usually obtuse; cleistogamous fls. on ascending peduncles. Newf. and westward along the Canadian border, to Brit. Col. and southward to Conn. — Albino forms, varying all the way to pure white, occur in New England.

21. *nephrophylla*, Greene (*V. cognata*, Greene). Nearly or quite glabrous: lvs. orbicular to somewhat reniform, crenate-serrate, obtuse, the later ones broadly cordate: fls. large, deep violet, on long peduncles; spurred petal villous, the lateral ones densely bearded; sepals ovate to lanceolate, obtuse; cleistogamous fls. erect. Cold mossy bogs and borders of streams and lakes, Newf. to Brit. Col., south to N. W. Conn. and N. Wis., and in high mountains to New Mex. and Cent. Calif.

22. *Sélkirkii*, Pursh. A very distinct small species with pale violet beardless petals, the spur long and much enlarged toward the rounded end: glabrous except for minute spreading hairs on the upper surface of the lf.-blades: lvs. thin, ovate to nearly orbicular, deeply cordate with a narrow sinus, crenate: sepals lanceolate or ovate-lanceolate, usually acute; cleistogamous fls.

erect or ascending. Shaded ravines and cold mountain forests, New Bruns. to Brit. Col., south in the Alleghanies to Pa. and in the Rocky Mts. to Colo., and north to Greenland; also in N. Eu.

CC. *Petals always white.*

D. *Lvs. lanceolate or narrower.*

23. *lanceolata*, Linn. Small glabrous species, with erect habit: lvs. lanceolate or elliptical, obscurely crenulate, gradually narrowed into a margined more or less colored petiole: fls. white, but the 3 lower petals with purplish veins, all usually beardless; sepals lanceolate; cleistogamous fls. erect. Open moist places, Nova Scotia to Minn. and southward. — A distinct and interesting species.

3942. Clump of common blue violet of the eastern states.—*Viola papilionacea*.

DD. *Lvs. ovate, with either narrowed or rounded base.*

24. *primulifolia*, Linn. Usually glabrous but sometimes pubescent: lvs. oblong to ovate, usually rounded at the base or cuneate, obscurely crenate-serrate, the petioles often manifestly winged above: fls. white with purplish veins, on peduncles exceeding the lvs.; sepals lanceolate, acuminate; 3 lower petals beardless or slightly bearded; cleistogamous fls. on shortish erect peduncles. Open moist ground, New Bruns. to Fla. and La.

DDD. *Lvs. cordate.*

25. *pallens*, Brainerd. Small neat species, for the most part glabrous, stoloniferous: lvs. broadly ovate or cordate-orbicular, sometimes only $\frac{1}{2}$ in. wide, but usually $1\frac{1}{2}$ -2 in., crenate-serrate, obtuse: fls. faintly fragrant, white; lateral petals usually with small tuft of hairs, the upper ones broadly obovate. Springy land and along cold brooks, Que. and southward,

3943. *Viola blanda*. (X1)

especially in the mountains to S. C. and Tenn. — The plant formerly known by many as *V. blanda*, and still often confused.

26. *blanda*, Willd. Fig. 3943. A northern species extending southward in the mountains to N. Ga., has acuminate lvs. somewhat hairy on the upper surface, and narrow strongly reflexed petals. Probably not in cult.

3941. *Viola palmata*. (X $\frac{1}{2}$)

DDDD. *Lvs. kidney-shaped.*

27. *renifolia*, Gray. Pubescent to nearly glabrous: rootstock in mature plants mostly stout and scaly: mature lvs. of summer reniform, distantly crenate-serrate, rounded at the summit: fls. white; petals beardless,

3944. *Viola rostrata*. ($\times \frac{1}{2}$)

the 3 lower ones veined or tinged brownish; sepals narrow-lanceolate; cleistogamous fls. purple, on horizontal peduncles: stolons absent. *Arbor-vitæ* swamps and cold woods, Newf. to the Mackenzie River, and southward in the Alleghany and Rocky Mts.

ccc. *Petals yellow.*

28. *rotundifolia*, Michx. Plant with long and stout scaly rootstocks, and making short stolons: lvs. in midsummer oval, 2-4 in. wide, thick and prostrate, crenate, fls. bright yellow, with brown lines on the 3 lower petals; lateral petals bearded; cleistogamous fls. on deflexed peduncles. Cold woods in the mountains from Maine to N. Ga.

BB. *Plants with evident sts.*

c. *Species eastern, or found east of the 100th meridian.*

d. *Petals yellow.*

29. *Nuttallii*, Pursh. Pubescent or nearly glabrous, with a deep stout rootstock: early lvs. and fls. from near the crown, the later fls. cleistogamous and on long peduncles; lvs. oblong-lanceolate, tapering into margined petioles, obtuse at apex, crenate-dentate or entire: fls. yellow, the petals beardless or with slight beards; sepals lanceolate or linear. From the Rocky Mts. eastward to Dak. and Mo.

30. *eriocarpa*, Schw. (*V. scabriuscula*, Schw.). Essentially glabrous or sparingly pubescent, the sts. ascending: root-lvs. usually 1-3, long-petioled, ovate to reniform, the base cordate or truncate, the apex usually rounded; st.-lvs. all on upper half of st., broad-ovate, subcordate, apex acuminate: fls. yellow, the lateral petals bearded; sepals narrowly lanceolate. Low woods, Nova Scotia to Man. and far southward.

31. *pubescens*, Ait. Markedly soft-pubescent: sts. 8-12 in. high, stout, often only one: root-lvs. usually wanting; st.-lvs. near the top, short-petioled, broad-ovate to reniform, the base cordate or truncate, crenate-dentate, somewhat short-pointed; stipules large: fls. bright yellow; lateral petals bearded; spur short; sepals narrow-lanceolate. Dry rich woods, Nova Scotia to N. D. and to Va. and Mo.

DD. *Petals white inside with bright yellow base.*

32. *rugulosa*, Greene (*V. Rydbergii*, Greene). Plants widely spreading from long underground stolons: first lvs. broad and densely pubescent underneath, long-petioled, cordate-reniform and abruptly acuminate: fls. sometimes tinged with violet. Minn. and westward to Colo. and Brit. Col.

33. *canadensis*, Linn. Plants without stolons, glabrous or very nearly so: lvs. broad-ovate, cordate, at apex acute or acuminate, serrate, the stipules sharp-lanceolate: fls. solitary from the axils of the st.-lvs., white inside with yellow center, the outside more or

less tinged with violet, the 3 lower petals with darker lines, the lateral petals bearded; sepals subulate. Woods, New Bruns. to Sask. and Rocky Mts., to Ala. and Ariz.

DDD. *Petals a uniform white or cream-color.*

34. *striata*, Ait. Plants caespitose, often 2 ft. high at maturity in summer, the sts. angular and leafy: lvs. nearly or quite glabrous, ovate to orbicular, cordate, mostly acuminate, closely crenate-serrate; stipules large and fimbriate: fls. white or cream-colored, long-stalked; sepals linear-lanceolate and ciliolate; spur thick and blunt. Shady places, N. Y. to Minn., Ga. and Mo.

DDDD. *Petals usually violet-blue.*

35. *conspersa*, Reichb. (*V. canina* var. *Muhlenbergii*, Gray). Plant glabrous, 3-6 in. high, with oblique often much-branched rootstock: lower lvs. cordate-orbicular, obtuse, crenate-serrate, not large ($\frac{3}{4}$ -1 $\frac{1}{2}$ in. wide); upper lvs. rather smaller and somewhat acuminate: fls. many, pale violet (running to white), overtopping the foliage; lateral petals bearded; spur 2-4 lines long; sepals acute. Que. to Minn. and Ga., in low or shaded places.

36. *rostrata*, Pursh. Fig. 3944. Glabrous or nearly so, 4-8 in. high, the sts. often numerous and plant forming a small clump: lvs. orbicular to broad-ovate, cordate, the upper ones acute, all serrate: fls. lilac with darker spots; petals beardless; spur long ($\frac{1}{8}$ - $\frac{1}{2}$ in.) and slender; cleistogamous fls. later on short axillary peduncles. A distinct and attractive species, in open woods and on hillsides, Que. to Mich. and southward.

3945. *Viola Sheltonii*. ($\times \frac{1}{2}$)

CC. *Species western, found only west of the 100th meridian.*

d. *Lvs. not dissected: petals yellow inside, the 2 upper madder-brown outside.*

37. *sarmentosa*, Douglas. Prostrate plants with thickened rootstocks and numerous long leafy runners: lvs. small, roundish cordate, deep green above but often rusty beneath, closely crenate, shorter than the peduncles: fls. light yellow, the lower petal somewhat purple-veined; spur short and broad. Along the Pacific coast.

38. *pedunculata*, Torr. & Gray. Sts. ascending, often 2 ft. long, bearing normally in each lf.-axil as the st. develops a large (1 in. across) orange-yellow fl. on a peduncle 2-5 in. long; rootstock thick and deep; lvs. round-ovate, the base usually truncate, coarsely crenate; stipules leafy; petals purple-veined inside, the lateral ones bearded. W. Calif., where often cult.; handsome.

3946. *Viola Beckwithii*. ($\times \frac{1}{2}$)

39. *glabélla*, Nutt. Sts. erect but usually weak, leafy only above; rootstock horizontal, more or less branching; lvs. cordate-reniform, glabrous or only puberulent, the lower ones on elongated petioles; stipules small; fls. bright yellow and somewhat purple-veined; lateral petals bearded; spur short and sac-like. Moist or shady places; widely distributed in the mountains of the N. W. and along the Pacific coast.

DD. Lvs. more or less 3-9-lobed or -parted.

40. *lobata*, Benth. St. long and mostly naked at the base, the plant either glabrous or finely pubescent; rootstock erect; lvs. reniform to broad-cuneate, palmately cleft into 5-9 narrow lobes and the central lobe toothed; fls. yellow, the upper petals brownish purple on the outside. Calif. and S. W. Ore.

DDD. Lvs. compoundly dissected into numerous small lobes; sts. leafy from the base.

E. Lateral petals beardless.

41. *Sheltonii*, Torr. Fig. 3945 (adapted from Pacific R. R. Report). Nearly or quite glabrous; lvs. orbicular-reniform to cordate, 3-divided, the divisions 3-parted, lobed and cleft into narrow segms., not exceeding the peduncles; upper petals brownish, the 3 lower pale yellow. N. W. Colo. and N. E. Calif.

EE. Lateral petals bearded, the 2 upper deep violet.

42. *Béckwithii*, Torr. & Gray. Fig. 3946 (adapted from Pacific R. R. Report). Plant pubescent or puberulent; lvs. palmately about 3 times 3-parted into very narrow lobes, about equaling the peduncles; 3 lower petals pale violet, the fls. thus closely resembling those of *V. pedata*. Utah to N. E. Calif. and Ore.

43. *Hállii*, Gray. Plant glabrous; rootstock deep; lvs. 3-divided, the divisions 3-5-cleft, the segms. narrow; stipules leafy; fls. violet and yellow, the 2 upper petals dark violet and the 3 lower petals yellow or cream-colored; lateral petals bearded at base. N. W. Calif. and W. Ore.

44. *trinervata*, Howell. Plant glabrous; ultimate segms. of the lf. lanceolate or ovate-lanceolate, tapering to an acute callous apex, thick and firm, prominently 3-ribbed; upper petals dark blue, the lower ones pale blue to whitish with a yellow base. Cent. and S. Wash.

EZRA BRAINERD.

VIOLET. One of the choicest of fragrant garden flowers. See *Viola*.

Comparatively few changes have taken place in the commercial cultivation of the violet within the past decade. The industry is more or less stabilized, and while there has been a tendency to increased planting of the single varieties, on the whole there has been no marked growth in the actual area under cultivation. The violet still offers some unique opportunities for the untrained lover of plants for the reason that it may be grown at less expense and with fewer and more simple houses and frames than almost any other of the major florist crops. While the violet readily responds to good treatment and to clean and healthy surroundings, its status is still relatively low owing to the fact that the risks of production are great, and this seems to develop a tendency toward carelessness on the part of those who take up the work as a business.

The cultivated varieties of the florist's violet are limited in number and probably all have been derived from the common sweet violet, *Viola odorata*, widely distributed over Europe and Asia. So far as known, no true varieties of the violet, either single or double, have originated in America. Of the double varieties and strains the most widely planted in this country are the Marie Louise (Fig. 3947) in its several forms, including Farquhar and Imperial; Lady Hume Campbell, Neapolitan (Fig. 3948), De Parme, Swanley White (Fig. 3949), and Madame Millet. For all practical purposes the culture of the double violet is confined to the Marie Louise, a true mauve in color, and the Campbell, a light mauve. The Neapolitan is a somewhat hardy type, but its color is too light for the market. The single varieties are coming to be important in the trade, and in the South and West are taking the place of the double sorts. South of Philadelphia, and north of Richmond, Virginia, the growing of any of the doubles is more or less risky, and it is in this territory and the Pacific coast that the singles are becoming so popular. The principal varieties are the Princess of Wales, Admiral Avellan, La France, California, and Baron Rothschild. The last is a promising variety, being a very free bloomer and a good keeper. The habit of this plant is compact and the foliage is of good texture, shape, and color.

Violets will grow and thrive in almost any good garden soil. The soil that will grow good strawberries or potatoes should, with proper care, grow good violets. Under such intensive cultivation as must necessarily be given the violet, it is important to give strict attention to soil preparation. Sod from an old pasture makes excellent soil for the crop, but care should be taken that it is not too heavy. A moderately sandy loam sod is

3947. Violet, Marie Louise. ($\times 1$)

best. This should preferably be cut in the fall and composted with well-decomposed stable-manure. Many growers use cow-manure, but no particular advantage has been observed in this material so far as the vigor of the crop is concerned. It is more difficult to secure and is not so easily handled; hence ordinary well-decomposed stable-manure is preferred. About one part manure should be used to four parts of soil, and a little extra work in thoroughly incorporating the manure with the soil always pays well. Some of the best growers make up the heaps by bringing the soil and manure together by means of wheelbarrows and then mixing by shoveling over the pile, as is done for concrete-mixing. When there are large quantities of soil to be mixed, the hauling can of course be done with wagons or carts. A one-horse cart makes a very convenient means of bringing the materials together. Before putting the soil into the houses or frames it should be turned and mixed again and for about every two or three thousand plants use a 200-pound bag of powdered quicklime. The lime may be sprinkled on the heap from time to time as the mixing takes place.

For all practical purposes the commercial cultivation of the violet is limited to growing in houses except in the South and far West, where for the most part they are grown in the open or in coldframes. There is still considerable growing done in frames, but there are so many inconveniences involved in this work that most of the frame culture has been abandoned for the cheaper forms of houses. Gradually, also, the method of growing the plants in the open field and later covering with frames is being abandoned. The violet is subject to so many diseases and troubles which are materially influenced by weather conditions that it is important to have control over at least the moisture conditions the greater part of the year. In house culture the crop is preferably grown in solid beds (Fig. 3950). Experience has shown that better and more flowers are secured by this method than by growing on benches. Then, again, there is the advantage of the long life of the solid beds and the lessened expense of the general work. Care should be taken not to have the beds too wide, otherwise it will be difficult to reach all parts of them from the walks. The best growers practise changing the soil each year. At least 5 inches of fresh soil should be put in before the young plants are set out. The time of planting varies somewhat in different parts of the country. Usually the flowers are not much in demand after the middle of April, so that in practically all the violet-growing sections preparations may begin at this time for clearing the houses and getting ready for the new crop. The plants, having been properly prepared, as will be described later, should be set 8 or 9 inches apart in rows 10 inches apart. This is the distance for the doubles. For the singles they are usu-

ally planted about 12 inches apart in the rows, the rows being from 12 to 18 inches apart. Most of the single varieties now under cultivation may be planted closer than this, say from 10 to 12 inches apart. After the plants are put out it is necessary that they should be carefully watered and all weeds in the beds kept down. It is desirable to keep the temperature as low as possible in summer. To this end the houses should be shaded. It is desirable to give plenty of fresh air, but care should be taken to have the top ventilators so arranged that the plants may be protected from rain. The violet requires considerable water, but no very rigid rules can be laid down as to the amount required. Every effort should be put forth to keep the plants in good growing condition without over-saturation of the soil. Early in summer the runners will begin to appear and these must be cut off as rapidly as the plants can be gone over conveniently. The object is to secure a good strong healthy compact plant and to induce free growth at all times, as with such strong free-growing plants developed by October 1 all the conditions will be at hand for the production of long-stemmed, good-colored flowers.

The violet may be propagated in a number of ways. One of the common practices is to divide the crown. This is usually done in spring after the flowering season is over. The plant is lifted and the soil shaken off, and then it may be readily pulled apart and the small plants either set in beds or flats. This method

has objections because a great many plants or crowns so separated are hard and woody, and they will refuse to grow into good vigorous healthy crowns. A second and more desirable method is carefully to select young and vigorous offshoots and root these in the ordinary way in sand. Following the second method the young plants can be secured from time to time during the late winter without disturbing the main plants. If proper care is exercised and good selection made, another good supply of stock may be readily available early in March, and selections may be made from these for the planting, which is performed the latter part of May.

Comparatively little attention has been given to proper houses for violet-culture. Almost any kind of house is believed to be suitable, hence the crop has

not had the advantages that more favored ones like the rose and carnation have had. Any good type of well-lighted, well-ventilated house will suffice. For beginners and those who have not a large amount of capital to invest, one of the most economical and satisfactory houses is an ordinary even-span type, 12 feet wide. The height of such house from the bottom of the walk to the ridge is 7 feet. The height of the side from the top of the plate to bottom of gutter is 20 inches. The walls can be easily boarded up with rough lumber and then covered with rustic siding. One walk 14 inches wide is made through the center of the house. This gives two beds, each 5 feet 5 inches wide. Such beds are a little wide for conveniently reaching the plants from

3948. Neapolitan.
(X1)

3949. Swanley. (X1)

the walk, but by means of a board to be hooked onto the heating pipes, all plants may be conveniently reached. Coldframes for violet-culture are simple in construction. They are of the usual type, being 6 feet wide, 12 inches high in front, and 16 to 18 inches high at the back. Ordinary 3 by 6 sash may be used. These frames may be made any length in locations where the soil is porous and well drained; the frames may be lower than the surrounding soil. This gives some advantages in winter although it is back-breaking work at any time properly to care for the plants and pick the flowers in such frames.

In sections where the climate is comparatively mild, violets may be planted directly in the open ground and the frames, which may be movable ones, may be set over the plants about the middle of September. Violet houses do not need much heat, merely enough in fact to keep out the frost. The tendency is to overheat and there are probably more good crops spoiled by too much rather than too little heat. Hot water is usually depended on for heating both houses and frames. For the average houses a boiler capacity of 1,200 to 1,500 square feet will be required for every 10,000 plants. With the present cost of materials and labor it is safe to figure the cost of a plain style of house such as already described at about 50 cents a plant. A house 12 feet wide and 100 feet long will hold about 2,000 plants and should cost complete from \$850 to \$1,000.

Marketing is one of the most important factors connected with commercial violet-growing and is seldom understood in all its details. The grower should be thoroughly familiar with the many needs and requirements of the market and be able to supply these demands, for upon his ability to do this depends largely his success or failure from a financial standpoint. Violets are prized chiefly for their delicate perfume, and as this diminishes in proportion to the length of time they are picked, the best market, other things being equal, is the one which requires the least possible delay between picking the flowers and placing them in the hands of the customer.

The crop may be disposed of at retail or wholesale or through a commission merchant. Each method has its advantages and disadvantages, and in deciding

3950. Growing violets in solid beds.

which one to adopt the grower must be guided by existing conditions. He must in any event have a thorough knowledge of the requirements of the market as regards quality of the flowers, size, shape, and arrangement of the bunch, and should at all times exercise the utmost care in picking, packing, and shipping, so that the flowers may reach the customer in the best and most attractive condition. The kind of bunch varies from year to year, and each large city

is likely to have its own style. The various styles are wonderfully exacting in their requirements and great skill is required to bunch the flowers properly.

The cultivated violets are subject to a number of diseases, each of which is characterized by one or more distinct symptoms. The principal diseases are as follows, their destructiveness being in the order in which they are discussed:

Spot disease (*Alternaria violæ*) (Fig. 3951), also called leaf-spot, leaf-rust, and smallpox, is the most widespread and destructive known in America. It attacks principally the foliage, normally producing definite circular whitish spots, frequently with concentric rings, of a darker shade, very often with a light central portion resembling the bite or sting of an insect. *Cercospora violæ*, *Phyllosticta violæ*, *Septoria violæ*, and the like, produce spots very similar in outline and appearance to those caused by *Alternaria violæ*, but only under conditions peculiarly favorable to these fungi do they cause any serious loss.

Root-rot (*Thielaviabasicola*) is very troublesome and destructive in some localities, especially to young plants that are transplanted during hot dry weather. It causes the browning or blackening of the parts attacked and the final death of the plant.

Wet-rot (*Botrytis sp.*) attacks leaves, petioles, flower-stalks, and flowers, causing a moist or soft rot. It is sometimes very destructive, especially with large plants growing in a damp stagnant atmosphere, where there is insufficient ventilation and light.

Leaf-fading or yellowing is induced by a variety of conditions, but as yet little that is definite has been ascertained regarding its cause.

It is difficult to exterminate any of the diseases named after they once gain a foothold. However, they can be held in check and often entirely prevented by selecting and propagating exclusively from strong vigorous disease-resistant plants, and by keeping them in the best possible growing condition. Careful attention must be given to watering, cultivation, and ventilation, and the dead and dying leaves and all runners should be destroyed as fast as they appear.

Although violets are attacked by a number of insects and other related enemies, only a few do sufficient injury to warrant discussion here.

Aphides (*Aphis sp.* and *Rhopalosiphum violæ*) are generally known as the green and the black aphid or the green- and black-fly. They cause the young growing parts to curl and twist, resulting in a stunted ill-formed plant. They work their way into the young, unopened flower-buds, and, thrusting their bills through the overlapping petals, feed on the juice. Each puncture produces a greenish white blotch on the petal, and the flower becomes dwarfed, distorted, and worthless for market. Aphides can be easily controlled by fumigating with hydrocyanic acid gas, and this is now in general use. To each cubic foot of space in the house or frame use .15 gram of 98 per cent cyanide of potash for double varieties and .10 gram for single varieties. Handle the cyanide and gas with utmost care, as both

3951. Violet spot disease.

are very poisonous. Divide the total amount of cyanide into as many equal parts as there are jars used, which latter should be one for every 50 to 75 lineal feet of a house 12 to 18 feet wide. Put each part into a two-pound manilla paper bag and this into a second bag. Attach each package to a string or wire so arranged as to allow it to be lowered from the outside of the house into its respective jar. Pour into each jar an amount of water about equal to the bulk of cyanide in the bag, add commercial sulfuric acid until steam is evolved, then from the outside lower the bags into the jars beneath. Fumigate double varieties thirty minutes and single varieties twenty minutes, after which open ventilators from outside, leaving them open at least sixty minutes before entering the house. Aphides may also be combated by using tobacco in some one of its many forms, but tobacco is likely to weaken the leaves and make them more liable to the attack of fungi, and on this account is very objectionable.

Red-spider (*Tetranychus telarius*) lives on the under surface of the leaves, and, when present in sufficient number, causes considerable damage. It is widely distributed on a great variety of plants, and when established in the violet-house is most difficult to combat. It can be held in check, and often the plants may be kept entirely free from it, by frequent syringing with clear water under a pressure of twenty to thirty pounds to the square inch. Care must be taken to syringe early in the morning and on bright days, so that the plants may dry off before night. Neglect may be the means of inducing disease.

Eel-worms, or nematodes, are sometimes very injurious to the violet. A common species attacks the roots, producing galls and distortions that check the growth of the plants. These may be controlled by judicious soil selection, the freezing of the soil in winter and the use of good clean grass sod. A very destructive nematode, *Aphelenchus olesistius*, that appeared in this country twelve or fifteen years ago, is rapidly becoming one of the serious enemies of the violet. This nematode attacks the crown-buds, causing the plants to "go blind." Rigid selection of stock is the only remedy. Every "blind" crown plant should be taken out and destroyed. Extreme care should be exercised in bringing in new stock. Nearly all imported plants are more or less affected with the pest. The bud nematode does more injury in this country than abroad. This may be due to the fact that while the pest has been imported, its enemies have not been brought in. Some very promising investigations are now being made by N. A. Cobb, of the Bureau of Plant Industry, United States Department of Agriculture, of a race of predaceous nematodes which destroy immense numbers of the harmful kinds.

In some parts of the country the larvæ of gall-fly (*Diplosis violicola*), violet sawfly (*Emphytus canadensis*), greenhouse leaf-tyer (*Phlyctenia rubigalis*), and several species of cutworms (*Agrotis et al.*) injure the plants to some extent by feeding on the foliage. Fumigating with hydrocyanic acid gas is the best means of combating them.

Under certain conditions slugs, snails, sowbugs, and the like, do considerable damage, especially to the flowers. They also can be controlled by the hydrocyanic acid gas treatment.

B. T. GALLOWAY.

P. H. DORSETT.

VIOLET, AFRICAN: *Saintpaulia*. **V. Damask or Dame's:** *Heperis matronalis*, V., **Dog's-Tooth:** *Erythronium*. V., **Water:** *Hottonia*.

VIRGÍLIA (named for the poet Virgil). *Leguminosæ*. Tree sometimes grown in the greenhouse: lvs. pinnately compound; lfts. small, without stipels; stipules narrow, caducous: fls. rose-purple, in short terminal racemes; calyx 2-lipped, upper 2-toothed, lower 3-toothed; petals long-clawed; standard recurved, orbicular;

wings ovate, falcate, keel shorter than the wings, beaked; stamens free; ovary sessile: pod linear, plano-compressed, leathery, 2-valved. One species, S. Afr. *V. capensis*, Lam. (*Podalyria capensis*, Andr.). Tree: lvs. with 6-10 pairs of lfts. which are linear-oblong, mucronate, the young ones silky on both sides, the old ones glabrous and glossy above: fls. rosy purple, $\frac{1}{2}$ in. long; calyx silky, widely campanulate. S. Afr. B.M. 1590.

V. lutea, Michx.—*Cladrastis lutea*.

VIRGINIA COWSLIP: *Mertensia virginica*. **V. Creeper:** *Parthenocissus quinquefolia*. **V. Stock:** *Malcomia*.

VIRGIN'S BOWER: *Clematis*.

VISCARIA: *Lychnis*.

VÍSCUM (the old Latin name used by Virgil and Pliny). *Loranthaceæ*. **MISTLETOE.** Parasitic shrubs which grow on trees and are well known to all on account of their use at Christmas. The lvs. are sometimes flat and rather thick, sometimes reduced to minute teeth or scales: fls. diœcious or monœcious at the axils or nodes: berry 1-seeded, naked or crowned with the perianth. About 70 species, natives of the temperate and warmer regions. Two species deserve mention: *V. album*, Linn. **COMMON MISTLETOE** (of Eu.). Yellowish green, glabrous shrub, 1-4 ft. high: lvs. opposite or in whorls of 3, 1-3 in. long, obovate-lanceolate, obtuse, 5-7-nerved: fr. white, nearly $\frac{1}{2}$ in. diam., ovoid or globose, viscid. Eu. and Temp. Asia. *V. cruciatum*, Sieber. Resembles *V. album* in habit, foliage, and infl., but the lvs. are very pale yellow-green and 3-nerved: berries red-brown, larger and long-pedicelled. Spain, N. E. Afr., and Syria. B.M. 7828. See also *Loranthus* and *Phoradendron*.

VÍSNEA (after a Lisbon merchant). *Ternstræmiaceæ*. Evergreen tree with the habit and infl. of Eurya, sometimes grown in the warmhouse: fls. small, subsessile; sepals 5, strongly imbricated, bases somewhat connate; petals 5, imbricate, bases connate; stamens numerous, adhering to the corolla at the very base; ovary 3-celled: fr. an indehiscent berry, included in the enlarged and fleshy calyx.—One species, Canary Isls., little known in cult.

Mocanëra, Linn. f. Tender evergreen shrub, 6-9 ft. high, of compact habit and with dark green, shining leathery foliage: lvs. short-petioled, ovate-lanceolate, serrate: fls. solitary, white, pendulous. Canaries.—It is a large evergreen shrub or small tree resembling in a general way a tea plant or camellia. The specific name Mocanera was given by the younger Linnaeus because the fr. was supposed to be the "mocan" of the aborigines which was made into a kind of sirup and used to a considerable extent. The fls. are only $\frac{3}{8}$ inch across, not very numerous and much shorter than the lvs., but they are very sweet-scented. It has been offered in S. Calif.

F. TRACY HUBBARD.†

VITELLARIA: *Lucuma*.

VÍTEX (ancient Latin name for this or a similar shrub). *Verbenaceæ*. Ornamental woody plants chiefly grown for their white, blue, or yellowish flowers produced in terminal spikes or panicles.

Deciduous or evergreen shrubs or trees: lvs. opposite, digitate, with 3-7, rarely with 1 lft.: fls. in often panicle, few- to many-fl. cymes; calyx campanulate, usually 5-toothed; corolla tubular-funnelform, with 5-lobed, oblique and slightly 2-lipped limb; stamens 4, 2 longer and 2 shorter ones: fr. a small drupe, with a 4-celled stone.—About 60 species are known, distributed through the subtropical and tropical regions of both hemispheres, few in the temperate regions. Some species, particularly *V. altissima* and *V. leucocylon*, in S. Asia are important timber trees.

CXVII. Victoria and nymphæa in a good setting.

The two species most often cultivated are shrubs or small trees with deciduous digitate leaves and lilac-blue or white flowers in terminal spikes or loose panicles appearing in summer and autumn. The hardiest seems to be *V. Negundo* var. *incisa*, which stands most ordinary winters as far north as Massachusetts. *V. Agnus-castus* is hardy as far north as New York, in sheltered positions. These species are particularly valuable for their late-appearing flowers. They grow in almost any kind of soil and prefer rather dry sunny situations. Most of the species are inhabitants of tropical and subtropical regions and only a few can be cultivated outdoors in warmer temperate regions. None of these tender kinds seems to be in cultivation in this country; in the Old World they are sometimes cultivated as greenhouse plants. They thrive in a sandy compost of peat and loam. Propagated by seeds sown in spring and by greenwood cuttings under glass; also by layers.

3952. *Vitex Negundo* var. *incisa*. ($\times \frac{1}{2}$)

small tree, with a strong aromatic odor, grayish tomentose: lvs. long-stalked; lfts. 5-7, lanceolate, acuminate, narrowed at the base into a short stalk, entire or with few coarse teeth, grayish-tomentose beneath, the middle one 3-4 in. long: the fls. in dense, sessile clusters, forming terminal, often paniced spikes 5-7 in. long; corolla usually pale or lilac, grayish outside, $\frac{1}{4}$ in. long; stamens and style exserted. July-Sept. S. Eu., W. Asia. Mn. 2, p. 44. G.C. III. 51:52. Var. *alba*, Rehd. (*V. albiflora*, Hort. *Agnus-castus vulgaris alba*, Carr.). Fls. white.

Negundo, Linn. Shrub or small tree with quadrangular branchlets: lfts. usually 5, or occasionally 3, stalked, elliptic-ovate to lanceolate, acuminate, serrate or entire, grayish tomentulose beneath, $1\frac{1}{2}$ -4 in. long: fls. lilac or lavender, small, scarcely $\frac{1}{4}$ in. long, stalked, in rather loose clusters forming slender spikes usually crowded into loose terminal panicles 5-8 in. long; stamens and style slightly exserted. China, India. Tender. Var. *incisa*, Clarke (*V. incisa*, Lam. *V. laciniata*, Hort.). Fig. 3952. Lfts. incisely serrate or almost pinnatifid, $\frac{3}{4}$ -3 in. long; the more extreme form with deeply pinnatifid lfts. and narrow remote segms. may be distinguished as f. *multifida*, Rehd. (*Agnus-castus incisa* var. *multifida*, Carr.). July-Aug. N. China, Mongolia. B.M. 364 (as *V. Negundo*). This variety is much harder than the type; it is less showy in bloom than the preceding species, but a graceful shrub of loose and open habit, with handsome foliage.

V. ilicifolia, A. Rich. Lvs. simple, short-stalked, oval, spiny-toothed; fls. in long-stalked, axillary, many-fld. cymes. Cuba.—*V. Lindeni*, Hook. f. Lfts. 3-5, elliptic or elliptic-obovate, glabrous fls. pale violet, in few-fld. axillary, long-stalked heads. Colombia. B.M. 6230.—*V. bicens*, T. Kirk (*V. littoralis*, A. Cunn.). Tree, to 60 ft., producing valuable hardwood: lvs. long-stalked; lfts. 3-5, elliptic, almost acuminate, glabrous; fls. in axillary panicles, abundant, dull red, 2-lipped. New Zeal.—*V. trifolia*, Linn. Lfts. usually 3, obovate or obovate-oblong, obtuse, entire: fls. blue, in terminal panicles. S. Asia. Polynesia. Var. *unifoliolata*, Schauer. With a solitary short-stalked lft.

ALFRED REHDER.

VITIS (classical Latin name). VINE. GRAPE. *Vitaceæ* or *Ampelidææ*. Tendril-climbers (some members of the genus *Cissus* erect) grown as ornamental vines but particularly for the edible fruits or grapes.

The genus is variously defined, but if *Cissus* is excluded it is distinguished as follows (Gray): Plants climbing by the prehension and coiling of naked-tipped tendrils: fls. polygamo-dioecious (i. e., some individuals perfect and fertile, others sterile with at most only a rudimentary ovary), 5-merous; corolla calyptrately caducous—the petals in anthesis cast off from the base while cohering by their tips (Fig. 3954); hypogynous disk of 5 nectariferous glands alternate with stamens; style short and thick, or conical: berry pulpy; seeds pyriform, with contracted beak-like base.—A widespread genus of the northern hemisphere, most abundant in temperate countries. In its stricter limitations, the genus includes less than 60 known species, but some authors unite *Cissus* and *Ampelopsis* with it, when it includes some 250 species. The standard monographer (Planchon, DC. Monogr. Phaner. 5), refers 30 or more species to *Vitis* in the main account and in the addendum, and more than 200 to *Cissus*. N. Amer. is particularly rich in *Vitis*, not only in number of species but in the widespread distribution and the abundance of the plants. From the native species have been developed the outdoor grapes of this country except those of Calif. and the extreme S. W. (which are *Vitis vinifera*). For an account of the evolution of these native cultural varieties, see Bailey, Sketch of the Evolution of Our Native Fruits; Hedrick's Grapes of New York, a notable volume issued by the N. Y. Agric. Exp. Sta.; also Munson, Foundations of American Grape Culture, 1909. For a sketch of *Vitis* and similar plants as ornamental vines, with illustrations, see Veitch, Journ. Roy. Hort. Soc. 28 (1903-4). For cult., and control of insects and diseases, see *Grape*. For recent studies in lf. variation and in pollen sterility, see M. J. Dorsey, Proc. Amer. Breeders' Assoc., vol. 7 (1912), and Bull. No. 144, Minn. Exp. Sta. (1914).

Many of the species of *Vitis* are excellent ornamental plants, when it is desired to cover arbors, porches, or trees; a number of the recently introduced oriental

3953. *Vitis*.—Forms of leaf on the same vine.

species (some of them properly referable to *Ampelopsis* and *Parthenocissus*) seem to be particularly interesting for such use. All of them are readily grown from seeds, and most of them from hardwood cuttings. Only a few of the native species are regularly in the trade; but with the possible exception of *V. Treleasei* they have been offered for sale to experiment stations and amateurs by the late T. V. Munson, of Texas, a well-known authority on both the botany and horticulture

of the grape. The popular interest in these species is primarily pomological; for, although the fruit may not be directly useful, the species give promise of development through hybridization and plant-breeding, and some of them afford useful stocks on which to graft kinds that do not resist the phylloxera or root-louse. The following discussion includes all the species native

3954. Grape flowers, enlarged. 1, shows the bud; 2, shows the petals or "cap" falling; 3, shows the flower in full bloom, the petals having been cast off. In all the flowers the minute calyx is seen, and in 2 and 3 the disk is shown inside the base of the stamens.

to North America north of Mexico; it is adapted from the writer's account in Gray's "Synoptical Flora," vol. 1, 420-430. These American grapes are very difficult to distinguish in many cases; hence the subjoined descriptions are full, to bring out the contrasting characters. Some of the best recent systematic writing on American Vitis is from French sources, since the American species have come into prominence in France as phylloxera-resisting stocks for the wine grape. See, for example, the works of Millardet, and Viala and Ravaz; also "Ampélographie Universelle," by Viala and Vermorel. Many of the species listed in the trade under Vitis will be found in the genera Ampelopsis, Parthenocissus, and Cissus.

The grape-vines of eastern Asia, although apparently not yielding fruit of value, are interesting as ornamental vines, and some of them are likely to come into prominence for their good foliage and brilliant autumn coloring. They are little known with us as yet. *V. Coignetiae* and *V. amurensis* are hardy in the northern states. Those tender at the Arnold Arboretum and more or less killed back in winter are *V. Davidii*, *V. flexuosa*, *V. Romanetii*, *V. pulchra*, *V. reticulata*, *V. Piasezkii*, and *V. pentagona*.

Vitis species are of easy culture for ornament, and probably all of them propagate by hardwood cuttings, although layering may be easier with some species. Even species that are tender in any locality often make very attractive new growths each year if the roots are not injured. Attention must be given to fungous diseases.

In southern California and other southern parts, a number of evergreen species now attain more or less prominence, particularly "the evergreen grape-vine" or *V. capensis*. These plants are mostly species of *Cissus* (which see, page 775), which is separated from *Vitis* by the mostly four-merous flowers with separate expanding petals and different disk, the plants often fleshy and sometimes erect rather than climbing. The evergreen set in cultivation more or less prominently in this country comprises *Cissus antarctica* (*V. Baudimiana*), page 776; *C. capensis* (*V. capensis*); *C. gongyloides* (*V. pterophora*), page 776; *C. hypoglauca* (*V. hypoglauca*); *C. oblonga* (*V. oblonga*); *C. quadrangularis* (*V. quadrangularis*); *C. rhombifolia* (*V. rhombifolia*); *Vitis Romanetii* (*V. rutilans*); *Cissus striata* (*V. sempervirens*), page 776. The standard English authorities combine *Cissus* and *Vitis*, but continental as well as American authors incline to keep them distinct. Several of the species properly referred to *Cissus* are described in the present account (Nos. 1-5), not having found their place regularly under *Cissus* in Vol. II.

I. Species of *Cissus* grown under the name of *Vitis*, to be added to those described on pages 775 and 776, Vol. II.

A. Plant fleshy, with winged sts.

1. *C. quadrangularis*, Planch. (*Vitis quadrangularis*, Linn.). An odd succulent with 4-winged sts. much constricted at the nodes, climbing, mostly glabrous, often nearly leafless, looking like a spineless cereus: lvs. varying from ovate and not lobed to cordate or reniform and deeply 3-lobed, the middle part sometimes lobed, the sinuses open and rounded, margins denticulate: fls. in small short-peduncled compound lateral cymes, the calyx 1 line long, the petals 4 and greenish; stamens 4, with short filaments: berries nearly globose, red, 1-seeded, size of pea, acid. Trop. Afr., Arabia, India, Moluccas.—Sts. said to be eaten by natives in Ceylon.

AA. Plant little or not at all fleshy: sts. sometimes angled but not winged.

2. *C. capensis*, Willd. (*Vitis capensis*, Thunb. *Rhoicissus capensis*, Planch.). Fig. 3955. EVERGREEN GRAPE-VINE of southern Calif., now much planted there: strong climbing vine, with globular ground tubers to 6 or 8 in. diam., terete striate sts. and young parts reddish hairy: lvs. long-stalked, simple, thickish,

3955. *Vitis capensis* (preferably known as *Cissus capensis*), an evergreen species prized in southern California. ($\times \frac{1}{2}$)

nearly orbicular to reniform, 3-nerved, obtusely 5-angled, the margin repand-dentate, with ovate stipules: infl. thyrs-like, tomentose, with long peduncles, the fls. woolly, with 5 triangular-ovate petals and 5 stamens, the ovary hirsute and style short: fr. globular, red-black and glossy, usually 2-seeded, about $\frac{1}{2}$ in. diam., said to be excellent for sirups, jellies, and for stewing. S. Afr.—Tubers reported as making wholesome fodder for cattle.

3. *C. hypoglauca*, Gray (*Vitis hypoglauca*, Muell.). Foliage handsome and persistent, dark green above and glaucous beneath; lfts. usually 5, obovate to elliptic, acuminate, stalked, entire or toothed toward the apex: fls. yellowish: fr. nearly globular. Austral.

4. *C. rhombifolia*, Planch. (*Vitis rhombifolia*, Vahl). Scandent evergreen, the branches angled but not winged: lvs. 3-foliate, petioled; lfts. all long-petiolulate, serrate, glabrous above, the lateral ones oblique and somewhat cordate, the middle one ovate to rhomb-ovate: fls. many in lf.-opposed clusters, the calyx and petals pubescent. W. Indies, S. Amer.

5. *C. oblōnga*, Planch. (*Vitis oblōnga*, Benth.). Erect tree-like evergreen species, the branches with a few tendrils, glabrous or the young shoots minutely tomentose: lvs. simple, broad-oblong to ovate-oblong, obtuse, about 1–2 in. long, entire, obscurely 3-nerved: fr. ovoid, small, 1–2-seeded, in short-peduncled cymes. Austral.—Allied to *C. antarctica*.

II. *Species of Vitis*, or true grapes: plants yielding the grapes of commerce, but some of them grown for arbors and for ornament.

- A. Bark bearing prominent lenticels, never shredding; nodes without diaphragms: tendrils simple: fl.-clusters small and not much elongated: seeds oval or oblong, without a distinct stipe-like beak. (*Muscadinia*; separated as a genus by Small.)
- B. Berries large ($\frac{1}{2}$ in. or more diam.), musky-tasted: lvs. firm or dense in texture, prominently pointed. 6. *rotundifolia*
- BB. Berries half smaller, acid: lvs. thin, not prominently pointed. 7. *Munsoniana*
- AA. Bark without distinct lenticels, on the old wood separating in long thin strips and fibers: nodes provided with diaphragms: tendrils forked: fl.-clusters mostly large and elongated: seeds pyriform. (*Euvitis*.)
- B. The wine-grape, grown extensively in Calif. as well as in Eu., and also in glass graperies: skin and pulp mostly firmly adhering in the ripe fr. 8. *vinifera*
- BB. The grapes of more modern domestication or intro. representing the commercial kinds in N. Amer. outside the Calif. region, and exotic species grown for ornament: skin of the mature berry usually separating freely from the pulp.
- C. Sts. stiff-hairy or bristly, or prickly. (*Spinovitis*.)
- D. Lvs. becoming glabrous beneath: sts. glabrous and prickly. 9. *Davidii*
- DD. Lvs. floccose or loosely pubescent beneath: sts. glandular-bristly and pubescent. 10. *Romanetii*
- CC. Sts. glabrous or pubescent, not aculeate or armed.
- D. *Vitis* species of N. Amer., some of them giving rise to pomological races and the others of botanical interest. (Nos. 11–32).
- E. Class of green-lvd. grapes, mostly marked at maturity by absence of prominent white, rusty, or blue tomentum or scurf or conspicuous bloom on the lvs. beneath (under surface sometimes thinly pubescent, or minute patches of

floccose wool in the axils of the veins, or perhaps even cobwebby): foliage mostly thin: tendrils intermittent, i. e., every third joint bearing no tendrils (or infl.). *V. cinerea* and *V. arizonica* are partial exceptions and might be looked for in EE (Nos. 11–23).

- F. Group of *vulpina*-like grapes, characterized by thin light or bright green mostly glossy lvs. (which are generally glabrous below at maturity except perhaps in the axils of the veins and in *V. Champinii*, with a long or at least a prominent point and usually long and large sharp teeth or the edges even jagged.
- G. Lvs. broader than long, with truncate-oblique base. (*V. Treleasei* might be sought here.) 11. *rupestris*
- GG. Lvs. ovate in outline, with a mostly well-marked basal sinus.
- H. Diaphragm (in the nodes) thin: young shoots not red: lvs. not deeply lobed.
- I. Lf.-margin not lobed or only obscurely so, the teeth small or else not elongated. 12. *monticola*
- II. Lf.-margin tending to be prominently lobed above, the teeth usually long.
- J. Young parts pubescent or floccose. 14. *Longii*
- JJ. Young parts nearly or quite glabrous.
- K. Tendrils prominent and persisting. 15. *vulpina*
- KK. Tendrils small and deciduous. 16. *Trelasei*
- HH. Diaphragm very thick and strong: young shoots bright red: lvs. often strongly lobed. 17. *rubra*
- FF. Group of *cordifolia*-like grapes, with thickish and dull-colored or grayish green lvs. often holding some close dull pubescence below at maturity and the shoots and lvs. nearly always more or less pubescent when young, the teeth mostly short, the point mostly rectangular and conspicuous.
- G. Plant strong and climbing, with stout persistent tendrils.
- H. Young shoots terete or slender, and glabrous or very soon becoming so. 18. *cordifolia*
- HH. Young shoots angled, and covered the first year with tomentum or wool.
- I. Under surface of lvs. glabrous or essentially so at maturity.
- J. Blade of lf. lustrous or glossy when full grown. 19. *Berlandieri*
- JJ. Blade of lf. dull. 20. *Baileyana*
- II. Under surface of lvs. grayish pubescent. 21. *cinerea*
- GG. Plant scarcely climbing, the tendrils perishing when failing to find support. 22. *arizonica*
- FFF. Group of orbicular-scallop-lvd. species of the Pacific coast. 23. *californica*
- EE. Class of colored-lvd. grapes, marked by thick or at least firm foliage, the lvs. prominently rusty or white-tomentose or glaucous-blue. *V. cinerea*, *V. arizonica*, and possibly *V. californica* might be sought here; and late-gathered forms of *V. bicolor* might be looked for in E.

- F. Lvs. only flocculent or cobwebby or glaucous below when fully grown (i. e. not covered with thick, dense, felt-like tomentum except sometimes in *V. Doaniana*).
- G. Ends of the growing shoots and the under surface of the lvs. whitish or gray: the white-tipped grapes.
- H. Grape of S. Calif., with thick diaphragms and short-pointed lvs. 24. *Girdiana*
- HH. Grape of Okla.-Texas region, with thin diaphragms and prominently pointed lvs. 25. *Doaniana*
- GG. Ends of shoots (except in *V. bicolor*), and the unfolding lvs. distinctly rusty-colored, and the mature lvs. either rusty or bluish beneath (or sometimes becoming green in *V. bicolor*): the æstivalian grapes.
- H. Growths usually prominently floccose or tomentose 26. *caribæa*
- HH. Growths pubescent or becoming nearly or quite glabrous.
- I. Under surface of lvs. mostly glaucous-blue. 27. *bicolor*
- II. Under surface not glaucous-blue (except in variety of No. 29).
- J. Berries small, $\frac{1}{8}$ in. or less through: eastern. 28. *æstivalis*
- JJ. Berries larger: western. 29. *Linsecomii*
- FF. Lvs. densely tomentose or felt-like beneath throughout the season, the covering white or rusty white.
- G. Tendrils intermittent (every third joint lacking tendril or fl.-cluster).
- H. Tomentum on under surface of lvs. white. 30. *candicans*
- HH. Tomentum on under surface rusty. 31. *Simpsonii*
- GG. Tendrils continuous (at every node a tendril or fl.-cluster). 32. *Labrusca*
- DD. *Vitis* species of E. Asia, somewhat intro. for ornament, mostly recently, and as yet little known in this country: mostly with lf.-resemblance to N. American species.
- E. Lvs. divided or compound on some of the shoots 33. *Piasezkii*
- EE. Lvs. undivided or variously lobed.
- F. Sts. glabrous at maturity. 34. *reticulata*
35. *flexuosa*
- FF. Sts. pubescent, tomentose, or floccose.
- G. Lobes of lvs. usually manifest. 36. *amurensis*
37. *Thunbergii*
- GG. Lobes of lvs. wanting or not marked.
- H. Base of lf. truncate or only obscurely cordate. 38. *pentagona*
39. *pulchra*
- HH. Base of lf. cordate. 40. *Coignetiae*
41. *lanata*

6. *rotundifolia*, Michx. (*V. muscadina*, *V. angulata*, *V. verrucosa*, *V. peltata*, *Muscadinia rotundifolia*, Small). MUSCADINE. SOUTHERN FOX GRAPE. BULLACE, BULLIT, or BULL GRAPE. Fig. 1708, Vol. III. Vine with hard warty wood, running even 60-100 ft. over bushes and trees, in the shade often sending down dichotomous aerial roots: lvs. rather small to medium (2-6 in. long), dense in texture and glabrous both sides (sometimes pubescent along the veins beneath), cordate-ovate and not lobed, mostly with a prominent and sometimes an acuminate point (but somewhat contracted above the termination of the 2 main side veins), the under surface finely reticulated between the veins, the teeth and the apex angular, coarse and

acute, the basal sinus shallow, broad and edentate; petiole slender and (like the young growth) fine-scurfy, about the length of the lf.-blade: tendrils (or fl.-clusters) discontinuous, every third node being bare: fr.-bearing clusters smaller than the sterile ones, and ripening from 3-20 grapes in a nearly globular bunch: berries falling from the clusters when ripe, spherical or nearly so and large ($\frac{1}{2}$ -1 in. diam.), with very thick and tough skin and a tough musky flesh, dull purple in color with-

7. *Munsoniana*, Simpson (*Muscadinia Munsoniana*, Small). MUSTANG GRAPE of Fla. BIRD, EVERBEARING, or EVERLASTING GRAPE.

Very slender grower, preferring to run on the ground or over low bushes, more nearly evergreen than the last, flowering more or less continuously: lvs. smaller, thinner, and more shining, more nearly circular in outline and less prominently pointed, the teeth broader in proportion to the blade and more open or spreading: clusters larger and more thyrs-like: berries a half smaller than in the last and often more numerous, shining black, with a more tender pulp, acid juice, no muskiness, and thinner skin; seeds half smaller than in the last. Dry woods and sands, Fla. at Jacksonville, Lake City, and southward, apparently the only grape on the reef keys; also in the Bahamas.—Difficult to distinguish from *V. rotundifolia* in herbarium specimens, but distinct in the field. The plant often bears fls. and both green and ripe fr. into Dec.

8. *vinifera*, Linn. WINE GRAPE. EUROPEAN GRAPE. Fig. 3956. Young growth smooth or floccose, the plant

not so high-climbing as most American species: tendrils intermittent; lvs. mostly thinnish, rounded, with a deep sinus and the basal lobes usually overlapping, tomentose or glabrous beneath, the margins coarsely notched or jagged: clusters large and long, the berries usually oval or oblong, although many varieties are globular-fruited. Probably native to the Caspian or Caucasus region and W. India. Cult. from the earliest times, and the grape of history; now greatly varied. The hothouse grapes, as Black Hamburg, Barbarossa, are of this species; also the vineyard grapes of Calif. Not hardy in the northern states and very subject to phylloxera (root-louse) and mildew. Regel, a Russian botanist, considered the wine grape to be a hybrid of 2 species that he characterized as *V. Labrusca* and *V. vulpina*, but this view is not accepted. Var. *apiifolia*, Loud. (*V. laciniata*, Linn. *V. vinifera* var. *laciniata*, Dipp.), has the lvs. cut into 5 much-cleft segms: ornamental: known as "parsley vine," and "ciotat." Gn. 54, p. 425.

9. *Dàvidii*, Föex (*Spinovitis Dàvidii*, Romanet. *Vitis Davidiana*, Dipp. *V. armata*, Diels & Gilg. *V. vinifera* var. *Dàvidii*, Hort.). Sts. and petioles armed with straight or slightly recurved prickles, glabrous: tendrils interrupted: lvs. long-petioled, large, paper-like, somewhat glaucous and becoming glabrous beneath, broadly ovate, obscurely angled, the base cordate, the apex acuminate and acute, the margin lightly repand-apiculate-serrate: thyrses peduncled, long-conical, usually surpassing the fl., the fls. very early: fr. rather large, globose, black. China.—Old branches prickly.

Var. *cyanoarpa*, Sarg. (*V. armata* var. *cyanoarpa*, Gagnep. *V. armata* var. *Veitchii*, Hort.). Less prickly, the growing shoots bare: fr. bluish: perhaps a hybrid. China.

10. *Romanétii*, Romanet (*V. rutilans*, Carr.). Petioles and young sts. floccose-pubescent and bearing spreading gland-bearing purplish hairs or bristles; sts. becoming nearly glabrous the second year: tendrils interrupted: lvs. large, cordate-orbicular and obscurely angled-3-lobed, coarsely crenate-dentate, at maturity nearly or quite glabrous above, below more or less floccose-pubescent at least on the nerves: thyrses peduncled, elongated-conical, surpassing the lvs.: fr. black, edible, the seeds globose-ovoid. China. R.H. 1890:444.

11. *rupestris*, Scheele. SAND, SUGAR, ROCK, BUSH, CURRANT, or MOUNTAIN GRAPE. Shrub, 2-6 ft. high, or sometimes slightly climbing, the tendrils few or even none, diaphragms plane and rather thin: lvs. reniform to reniform-ovate (about 3-4 in. wide and two-thirds as long), rather thick, smooth and glabrous on both surfaces at maturity, marked by a characteristic light glaucescent tint, the sides turned up so as to expose much of the under surface, the base only rarely cut into a well-marked sinus, the margins very coarsely angle-toothed, the boldly rounded top bearing a short, abrupt point and sometimes 2 lateral teeth enlarged and suggesting lobes: stamens in fertile fls. recurved laterally or rarely ascending, those in the sterile fls. ascending: cluster small, slender, open and branched: berries small ($\frac{1}{4}$ - $\frac{1}{2}$ in. diam.), purple-black and somewhat glaucous, pleasant-tasted, ripe in late summer; seeds small and broad. Sandy banks, low hills, and mountains, S. Pa. to Tenn., Ind., Mo., Okla., and S. W. Texas. Var. *dissécta*, Eggert, is a form with more ovate lvs. and very long teeth, and a strong tendency toward irregular lobing. Mo.

12. *monticola*, Buckl. (*V. texana*, Munson. *V. Foexiana*, Planch.). SWEET MOUNTAIN GRAPE. Fig. 3957. A slender trailing or climbing plant (reaching 20-30 ft. in height, with very long and slender branches, the young growth angled and floccose (sometimes glabrous), the diaphragms plane and rather thin: lvs. small and thin (rarely reaching 4 in. in width and gen-

erally from 2-3 in. high), cordate-ovate to triangular-ovate, with the basal sinus ranging from nearly truncate oblique to normally inverted U-shaped, rather dark green but glossy above and grayish green below, when young more or less pubescent or even arachnoid below, the blade either prominently notched on either upper margin or almost lobed, the point acute and often prolonged, margins irregularly notched with smaller teeth than in *V. rupestris*: clusters short and broad, much branched: berries medium or small (averaging about $\frac{1}{2}$ in. diam.), black or light-colored, seedy, sweet; seeds large (about $\frac{1}{4}$ in. long) and broad. Limestone hills in S. W. Texas.—This species has been the subject of much misunderstanding.

13. *Châmpinii*, Planch. Probably a hybrid of *V. rupestris* or *V. Berlandieri* and *V. candicans*, bearing medium to large reniform or reniform-cordate lvs. which are variously pubescent or cobwebby but become glabrous, the growing tips mostly white-tomentose: berries very large and excellent. S. W. Texas. A.G. 12:579.—In some places associated with *V. candicans*, *V. Berlandieri*, and *V. monticola* only, and in others with the above and *V. rupestris*. Often composing dense thickets in the wild.

3957. *Vitis monticola*. ($\times \frac{1}{2}$)

14. *Lóngii*, Prince (*V. Solonis*, Planch. *V. nuevo-mexicana*, Lemm.). Differs from vigorous forms of *V. vulpina* in having floccose or pubescent young growth: lvs. decidedly more circular in outline, with more angular teeth and duller in color, often distinctly pubescent beneath: stamens in fertile fls. short and weak and laterally reflexed, those in sterile fls. long and strong: seeds larger. W. Okla., N. W. Texas, New Mex. and S. Colo.—Regarded by French authors as a hybrid, the species *V. rupestris*, *V. vulpina*, *V. candicans*, and *V. cordifolia* having been suggested as its probable parents; but Munson thinks that it has "a well-characterized specific make-up of its own." It is variable in character. In most of its forms it would be taken for a compound of *V. rupestris* and *V. vulpina*, but the latter species is not known to occur in most of its range. It was very likely originally a hybrid between *V. rupestris* (which it sometimes closely resembles in herbarium specimens except for its wooliness) and some tomentose species (possibly with *V. arizonica* or *V. Doaniana*), but it is now so widely distributed and grows so far removed from its supposed parents and occurs in such great quantity in certain areas, that for taxonomic purposes it must be kept distinct. It is not unlikely that it has originated at different places as the product of unlike hybridizations. Late French writers designate the jagged-lyd. forms as *V. Solonis*, and the dentate forms as *V. nuevo-mexicana*. This interesting grape was

found about fifty years ago by Engelm. in the Botanic Garden of Berlin under the name of *Vitis Solonis*, without history. Engelm. guesses (Bush-berg Cat. ed. 3, 18) the name to be a corruption of "Long's." It is probable that the plant was sent to European gardens as *Vitis Longii*—very likely from Prince's nursery—and the name was misread on the label. The original name, which was duly published by Prince with description, may now be restored.

Var. *microspérma*, Bailey (*V. Solonis* var. *microspérma*, Munson), is a very vigorous and small-seeded form, which is very resistant to drought. Red River, N. Texas.

15. *vulpina*, Linn. (*V. riparia*, Michx. *V. odoratissima*, Donn. *V. odorata*, Hort. *V. illinoensis* and *V. missouriensis*, Prince? *V. cordifolia* var. *riparia*, Gray). RIVERBANK or FROST GRAPE. Fig. 3958. A vigorous tall-climbing plant, with a bright green cast to the foliage, normally glabrous young shoots, large stipules, and plane very thin diaphragms: lvs. thin, medium to large, cordate-ovate, with a broad but usually an evident sinus, mostly showing a tendency (which is sometimes pronounced) to 3 lobes, generally glabrous and bright green below, but the veins and their angles often pubescent, the margins variously deeply and irregularly toothed and sometimes cut, the teeth and the long point prominently acute: fertile fls. bearing reclining or curved stamens, and the sterile ones long and erect or ascending stamens: clusters medium to large, on short peduncles, branched (often very compound), the fls. sweet-scented: berries small (less than $\frac{1}{2}$ in. diam.), purple-black with a heavy blue bloom, sour and usually austere, generally ripening late (even after frost); seeds rather small and distinctly pyriform.—The commonest grape in the northern states west of

3958. *Vitis vulpina*. ($\times \frac{1}{2}$)

New England, abundant along streams. Variable in the flavor and maturity of the fr. Forms with petioles and under surfaces of lvs. pubescent sometimes occur. It apparently hybridizes with *V. Labrusca* eastward, the hybrid being known by the tomentose young shoots and unfolding lvs., and the darker foliage, which

3959. *Vitis rubra* form
($\times \frac{1}{3}$)

is marked with rusty tomentum along the veins of the less jagged lvs.

Var. *præcox*, Bailey, is the JUNE GRAPE of Mo., the little sweet frs. ripening in July.

16. *Trelêasei*, Munson. Plant shrubby and much branched, climbing little, the small and mostly short (generally shorter than the lvs.) tendrils deciduous the first year unless finding support, internodes short, the diaphragms twice thicker (about $\frac{1}{16}$ in.) than in *V. vulpina* and shallow-biconcave: stipules less than one-fourth as large as in *V. vulpina*: lvs. large and green, very broad-ovate or even reniform-ovate (often wider than long), thin, glabrous and shining on both surfaces, the basal sinus very broad and open and making no distinct angle with the petiole, the margin unequally notch-toothed (not jagged as in *V. vulpina*) and indistinctly 3-lobed, the apex much shorter than in *V. vulpina*: fertile fls. with very short, recurved stamens, sterile with ascending stamens: cluster small (2-3 in. long): berries $\frac{1}{8}$ in. or less thick, black with a thin bloom, ripening 3 weeks later than *V. vulpina* when grown in the same place, thin-skinned; pulp juicy and sweet; seeds small. Brewster Co., S. W. Texas and New Mex. to Bradshaw Mts., Ariz.—Little known, and possibly a dry-country form of *V. vulpina*. In habit it suggests *V. arizonica* var. *glabra*, from which it is distinguished, among other things, by its earlier flowering and larger lvs. with coarser teeth and less pointed apex.

17. *rubra*, Michx. (*V. monosperma*, Michx.). RED or CAT GRAPE. Fig. 3959. A slender but strong-growing vine, with small long-jointed angled red glabrous herb-like shoots and red petioles: lvs. small to medium, ovate-acuminate, dark green and glossy, sometimes indistinctly pubescent on the nerves below, the sinus obtuse, the blade either nearly continuous in outline or (commonly) prominently lobed or even parted, coarsely notched: stamens in the sterile fls. long and erect: clusters loose and long-peduncled, branched, the fls. opening very late: berries small and late ($\frac{1}{4}$ – $\frac{3}{8}$ in. diam.),

black without bloom, with little juice and commonly containing but a single seed, which is large and broad. Ill. and Mo. to Texas; known mostly along the Wabash River and along the Mississippi in the latitude of St. Louis. G.F. 2:341 (repeated in Fig. 3959).—A handsome plant. *V. palmata*, Vahl, founded on Virginian specimens, is probably *V. vulpina*, although it is sometimes made to replace the name *V. rubra*.

18. *cordifolia*, Michx. TRUE FROST GRAPE. CHICKEN, RACCOON, or WINTER GRAPE. One of the most vigorous of American vines, climbing to the tops of the tallest trees, and sometimes making a trunk 1–2 ft. diam.: diaphragms thick and strong; lvs. long-cordate, triangular-cordate with rounded base, or cordate-ovate, undivided but sometimes very indistinctly 3-lobed or 3-angled, the basal sinus rather deep and narrow, the margin with large acute teeth of different sizes and the point long and acute, the upper surface glossy and the lower bright green and either becoming perfectly glabrous or bearing a little close and fine inconspicuous grayish pubescence on the veins; petioles long: stamens erect in the sterile fls. and short reflexed-curved in the fertile ones: clusters long and very many-flowered, most of the pedicels branched or at least bearing a cluster of fls.: berries numerous and small (about $\frac{3}{16}$ in. diam.), in a loose bunch, black and only very slightly glaucous, late and persistent, with a thick skin and little pulp, becoming edible after frost; seeds medium and broad. In thickets and along streams from Pa. (and probably S. N. Y.) to E. Kans., Fla., and Texas.

Var. *foetida*, Engelm., has fetidly aromatic berries, and grows in the Mississippi Valley.

Var. *sempervirens*, Munson. A glossy-lvd. form holding its foliage very late: lvs. sometimes suggesting forms of *V. rubra*, deltoid with a truncate base: clusters small, the fr. ripening later than in the type. S. Fla.

Var. *Helleri*, Bailey (*V. Helleri*, Small). Lvs. more circular (i. e., lacking the long point), and the teeth round-obtuse and ending in a short mucro. Kerr Co., S. Texas, 1,600–2,000 ft.

19. *Berlandieri*, Planch. MOUNTAIN, SPANISH, FALL, or WINTER GRAPE. Fig. 3960. A stocky moderately climbing vine, with mostly short internodes and rather thick diaphragms: lvs. medium large, broadly cordate-ovate or cordate-orbicular (frequently as broad as long), glabrous and glossy above, covered at first with gray pubescence below but becoming glabrous and even glossy except on the veins, the sinus mostly inverted-U-shaped in outline but often acute at the point of insertion of the petiole, the margin distinctly angled above or shortly 3-lobed and marked by rather large, open, notch-like acute teeth of varying size, the apex mostly pronounced and triangular-pointed: stamens long and ascending in the sterile fls., laterally recurved in the fertile ones: clusters compact and compound, mostly strongly shouldered, bearing numerous medium to small ($\frac{1}{2}$ in. or less diam.), purple and slightly glaucous very late berries which are juicy and pleasant-tasted; seed (frequently only 1) medium to small. Limestone soils along streams and hills, S. W. Texas and Mex.—Well marked by the gray-veined under surface of the lvs.

20. *Baileyana*, Munson. 'POSSUM GRAPE. Less vigorous climber than *V. cordifolia*, rather slender, with short internodes and very many short side shoots: lvs. frequently smaller, the larger ones shortly but distinctly 3-lobed (lobes mostly pointed and much spreading), bright green but not shining above, gray below and pubescent at maturity only on the veins, the point only rarely prolonged and often muticous, the teeth comparatively small and notch-like and not prominently acute, sinus more open; petioles shorter and often

pubescent: floral organs very small, the stamens reflexed in the fertile fls.: pedicels short, making the bunch very compact: berries about the size of *V. cordifolia*, black and nearly or quite bloomless, late; seed small and notched on top. Mountain valleys, 800–3,000 ft. altitude, S. W. Va. and adjacent W. Va. and W. N. C., Tenn., and N. Ga.; also at common levels in the uplands of W. Cent. Ga.—The eastern counterpart of *V. Berlandieri*.

21. *cinerea*, Engelm. SWEET WINTER GRAPE. Fig. 3961. Climbing high, with medium to long internodes and thick and strong diaphragms: lvs. large, broadly cordate-ovate to triangular-cordate-ovate (generally longer than broad), the sinus mostly wide and obtuse,

3960. *Vitis Berlandieri*.
($\times \frac{1}{2}$)

the margin small-notched (teeth much smaller than in *V. Berlandieri*) or sometimes almost entire, mostly distinctly and divaricately 3-angled or shortly 3-lobed toward the apex, the triangular apex large and prominent, the upper surface cobwebby when young but becoming dull dark green (not glossy), the under surface remaining ash-gray or dun-gray, webby-pubescent: stamens in sterile fls. long, slender, and ascending, in the fertile ones short and laterally recurved: cluster mostly loose and often straggling, containing many small black berries, these only slightly, if at all glaucous, ripening very late, and after frost becoming sweet and pleasant; seeds small to medium. Along streams, mostly in limy soils, Cent. Ill. to Kans. and Texas; also N. Fla., also in Mex.—Readily distinguished from *V. aestivalis* by the triangular-topped sharply 3-lobed ash-gray lvs. and the gray tomentum of the young growth.

Var. *floridana*, Munson (*V. australis*, Small). Growing tips rusty-tomentose, as are sometimes the veins on

the under sides of the lvs.: cluster longer-peduncled and more compound. Manatee Co., Fla.; and apparently also in Ark.; possibly a compound with *V. æstivalis*, but the lvs. have the characteristic shape of *V. cinerea*. Not to be confounded with any form of *V. caribæa*, because of the lobed triangular-topped lvs. and much larger teeth.

Var. *canescens*, Bailey. A form with rounded or heart-like lvs., the upper half of the lf. lacking the triangular and 3-lobed shape of the type. St. Louis, Mo., and S. Ill. to Texas.

22. *arizónica*, Engelm. (*V. arizonensis*, Parry). CAÑON GRAPE. Plant weak, much branched, with short internodes and thick diaphragms, branchlets angled: lvs. mostly small, cordate-ovate and with a prominent triangular-pointed apex, the sinus broad or the base of the blade even truncate, the teeth many and small and pointed or mucronate, the margin either continuous or very indistinctly 3-lobed (or sometimes prominently lobed on young growths), the lvs. and shoots white-woolly when young, but becoming nearly glabrous with age: stamens ascending in sterile fls. and recurved in the fertile ones: bunches small and compound, not greatly, if at all, exceeding the lvs., bearing 20-40 small black berries of pleasant taste; seeds 2-3, medium size. Along river banks, W. Texas to New Mex. and Ariz., mostly south of the 35th parallel, to S. E. Calif. and N. Mex.

Var. *glabra*, Munson. Plant glabrous, with glossy and mostly thinner and larger lvs. In mountain gulches, with the species and ranging northward into S. Utah. Distinguished from *V. monticola* by its triangular-pointed and small-toothed lvs. Perhaps a form of *V. Treleasei*.

23. *californica*, Benth. Fig. 3962. A vigorous species, tall-climbing on trees but making bushy clumps when not finding support, the nodes large and diaphragms rather thin: lvs. mostly round-reniform (the broader ones the shape of a horse's hoof-print), rather thin, either glabrous and glossy or (more commonly) cottony-canescens until half grown and usually remaining plainly pubescent below, the sinus ranging from very narrow and deep to broad and open, the margins varying (on the same vine) from finely blunt-toothed to coarsely scallop-toothed (the latter a characteristic feature), the upper portion of the blade either perfectly continuous and rounded or sometimes indistinctly 3-lobed and terminating in a very short apex: bunches medium, mostly long-peduncled and forked,

the numerous small berries glaucous-white, seedy and dry but of fair flavor; seed large ($\frac{1}{4}$ - $\frac{1}{5}$ in. long), prominently pyriform. Along streams in Cent. and N. Calif. and S. Ore.—Lvs. becoming handsomely colored and mottled in autumn. Very susceptible to mildew.

3961. *Vitis cinerea*. ($\times \frac{1}{4}$)

24. *Girdiana*, Munson. VALLEY GRAPE. SOUTHERN CALIFORNIA GRAPE. Strong climbing vine, with thick diaphragms: lvs. medium to large and rather thin, broadly cordate-ovate, with a rather deep and narrow sinus and nearly continuous or obscurely 3-lobed outline (sometimes markedly 3-lobed on young shoots), the teeth many and small and acute, the apex short-triangular or almost none, the under surface remaining closely ashy-tomentose: clusters large and very compound, each one dividing into 3 or 4 nearly equal sections, which are in turn shouldered and thyrses-like: berries small, black and slightly glaucous, the skin thin but tough, pulp finally becoming sweet; seeds medium in size, pyriform. S. Calif., south of the 36th parallel.—Differs from *V. californica* in the more pubescent shoots and foliage, smaller and sharp teeth, decom-

pound clusters, smaller less glaucous berries, and smaller seeds. Shoots of *V. californica* often bear lvs. with small and muticous teeth, and such specimens without the fl.-clusters are difficult to distinguish from this species. Some of the forms which have been referred to *V. Girdiana* are apparently hybrids with the wine grape, *V. vinifera*; the plant is imperfectly understood and its merits as a species

are yet to be determined. It bears the name of H. H. Gird, of Calif.

25. *Doaniæna*, Munson. Plant vigorous, climbing high or remaining bushy if failing to find support, with short internodes and rather thin diaphragms: lvs. bluish green in cast, mostly large, thick, and firm, cordate-ovate or round-ovate in outline, bearing a prominent triangular apex, the sinus either deep or shallow, the margins with very large, angular, notch-like teeth and more or less prominent lobes, the under surface usually remaining densely pubescent and the upper surface more or less floccose: cluster medium to small,

3962. *Vitis californica*. ($\times \frac{1}{2}$)

bearing large ($\frac{3}{8}$ in. and less diam.), black, glaucous berries of excellent quality; seeds large ($\frac{1}{4}$ – $\frac{3}{8}$ in. long), distinctly pyriform. *Chiefly in N. W. Texas, but ranging from Greer Co., Okla., to beyond the Pecos River in New Mex. G.F. 9:455.—The species varies

3963. *Vitis caribaea*. ($\times \frac{1}{4}$)

greatly in pubescence, some specimens being very nearly glabrous at maturity and others densely white-tomentose. The plant would pass as a hybrid of *V. vulpina* and *V. candidans*, except that these species do not often occur in its range. It bears the name of Judge J. Doan, of Wilbarger Co., Texas. It gives promise as a parent of pomological grapes. The Arnold Arboretum reports it as "a fast-growing plant and appears to be perfectly at home in New England. The leaves are large, thick and firm, and rather pale bluish green in color. The fruit, which grows in small clusters, is blue covered with a pale bloom and of fair quality."

26. *caribaea*, DC. Fig. 3963. Climbing, with flocculent-woolly (or rarely almost glabrous) and striate shoots: tendrils rarely continuous: lvs. cordate-ovate or even broader and mostly acuminate-pointed, sometimes obscurely angled above (but never lobed except now and then on young shoots), becoming glabrous above but generally remaining rufous-tomentose below, the margins set with very small, mucro-tipped sinuate teeth: cluster long and long-peduncled, generally large and very compound: berry small and globose, purple; seed obovate, grooved on the dorsal side. A widely distributed and variable species in the American tropics, running into white-lvd. forms (as in *V. Blancoi*, Munson). Although supposed to occur from Fla. to Texas, Munson is "unable to discover the slightest traces of this species in the U. S.," he considers the

Fla. plants to be hybrids of other species, or forms of *V. cinerea*. The species is considered to be promising for the development of a pomological grape for the tropics (F. S. Earle, Journ. Heredity, Dec., 1915). *V. rufotomentosa*, Small, differs in having the lf.-blades usually distinctly lobed and the margins coarsely toothed, rusty-tomentose on nerves beneath: sandy soil, Fla to La.

27. *bicolor*, Le Conte (*V. argentifolia*, Munson) BLUE GRAPE, or SUMMER GRAPE of the N. Fig. 3964. A strong high-climbing vine, with mostly long internodes and thick diaphragms, the young growth and canes generally perfectly glabrous and mostly (but not always) glaucous-blue: tendrils and petioles very long: lvs. large, round-cordate-ovate in outline, glabrous and dull above and very heavily glaucous-blue below, but losing the bloom and becoming dull green very late in the season, those on the young growth deeply 3-5-lobed and on the older growths shallowly 3-lobed, the basal sinus running from deep to shallow, the margins mostly shallow-toothed or sinuate-toothed (at least not so prominently notch-toothed as in *V. æstivalis*): cluster mostly long and nearly simple (sometimes forked), generally with a long or prominent peduncle: the purple and densely glaucous berries of medium size ($\frac{1}{2}$ in. or less diam.), sour but pleasant-tasted when ripe (just before frost); seeds rather small. Abundant northward along streams and on banks, there taking the place of *V. æstivalis*. Ranges from New England and Ill. to the mountains of W. N. C. and to W. Tenn. —Well distinguished from *V. æstivalis* (at least in its northern forms) by the absence of rufous tomentum, the blue-glaucous small-toothed lvs. and long petioles and tendrils. It has been misunderstood because it loses its glaucous character in autumn; an excellent species as a covering for arbors and trellises.

28. *æstivalis*, Michx. (*V. Nörtoni*, Prince. *V. Labrusca* var. *æstivalis*, Regel. *V. bracteata* and *V. araneosus*, Le Conte). SUMMER, BUNCH, or PIGEON GRAPE. Strong tall-climbing vine, with medium short internodes, thick diaphragms, and often pubescent petioles: lvs. mostly large, thinnish at first but becoming rather thick, ovate-cordate to round-cordate in outline, the sinus either deep (the basal lobes often overlapping) or broad and open, the limb always lobed or prominently angled, the lobes either 3 or 5, in the latter case the lobal sinuses usually enlarged and rounded at the extremity, the apex of the lf. broadly and often obtusely triangular, the upper surface dull and becoming glabrous and the under surface retaining a covering of copious rusty or red-brown pubescence which clings to the veins and draws together in many small, tufty masses: stamens in fertile fls. reflexed and laterally bent: clusters mostly long and long-peduncled, not greatly branched or even nearly simple (mostly interrupted when in flower), bearing small ($\frac{1}{8}$ in. or less diam.), black, glaucous berries, which have a tough skin and a pulp ranging from dryish and astringent to juicy and sweet; seeds 2-4, medium size ($\frac{1}{4}$ in. or less long). S. N. Y. to Cent. Fla. and westward to the Mississippi and Missouri rivers.—A marked type readily distinguished from other species by the reddish fuzz of the under side of the lvs.

Var. *Bourquiniana*, Bailey (*V. Bourquiniana*, Munson). A domestic offshoot, represented in such cult. varieties as Herbemont and Le Noir, differing from *V. æstivalis* in its mostly thinner lvs. which (like the young shoots) are only slightly red-brown below, the pubescence mostly cinerous or dun-colored or the under surface sometimes blue-green: berries large and juicy, black or amber-colored.—A mixed type, much cult. S. It is probably exotic, but may have been modified

3964. *Vitis bicolor*. ($\times \frac{1}{3}$)

by hybridization. Probably to be associated botanically with *V. vinifera*.

29. *Linsecumii*, Buckl. (*V. diversifolia*, Prince. *V. æstivalis* var. *Linsecumii*, Munson). POST-OAK. PINE-WOOD, or TURKEY GRAPE. More stocky than *V. æstivalis*, climbing high upon trees but forming a bushy clump when not finding support: lvs. densely tomentose or velvety below; berries large ($\frac{1}{8}$ – $\frac{3}{4}$ in. diam.), black and glaucous, mostly palatable; seeds mostly much larger than in *V. æstivalis* (often $\frac{3}{4}$ in. long). High post-oak (*Quercus stellata*) lands, S. W. Mo. to Texas and E. La.—Munson distinguishes it from *V. æstivalis* by larger berries and seeds, larger lvs. which are bluish in the var. *glauca*, greater endurance of drought. A promising species for the pomologist. It bears the name of Dr. Gideon Linsecum, and is often written *V. Linsecumii*, but if such original spellings as *Wisteria*, *Zanthoria*, *Gleditsia*, *Stewartia* and many others are to be retained, consistency requires that we hold to Buckley's original spelling, *V. Linsecumii*.

Var. *glauca*, Munson (*V. æstivalis* var. *glauca*, Bailey). Lvs. and mature wood glaucous-blue on the body beneath, but the veins rusty; berries and seeds larger. S. W. Mo. to N. Texas.—Much like *V. bicolor*, but lvs. thicker and more pubescent below, and tips of shoots rusty-tomentose; berries larger and the clusters strongly shouldered.

30. *candicans*, Engelm. (*V. mustangensis*, Buckl.). MUSTANG GRAPE. Plant strong and high-climbing, with densely woolly young growth (which is generally rusty-tipped), and very thick diaphragms: lvs. medium in size and more or less poplar-like, ranging from reniform-ovate to cordate-ovate or triangular-ovate, dull above but very densely white-tomentose below and on the petioles, the basal sinus very broad and open or usually none whatever (the base of the lf. then nearly truncate), deeply 5–7-lobed (with enlarging rounded sinuses) on the strong shoots and more or less indistinctly lobed or only angled on the normal growths, the margins wavy or sinuate-toothed; stamens in the sterile fls. long and strong, those in the fertile fls. very short and laterally reflexed: cluster small, mostly branched, bearing 12–20 large ($\frac{3}{4}$ in. or less diam.) purple or light-colored or even whitish berries, which have a thick skin and a very disagreeable fiery flavor; seeds large, pyriform. W. Ark., Okla., N. Texas, mostly on limestone soils.

Var. *coriacea*, Bailey (*V. coriacea*, Shuttlew.). LEATHER-LEAF or CALLOOSA GRAPE. Fig. 3965. Differs from the species chiefly in bearing much smaller (about $\frac{1}{8}$ in. diam.) thinner-skinned and more edible grapes with mostly smaller seeds, and perhaps a less tendency to very deep lobing in the lvs. on young shoots and possibly rather more marked rustiness on the young growths. Fla. chiefly southward, in which range various Texan plants reappear.—The more agreeable quality of the fr. is perhaps the result of a more equable and moister climate.

31. *Simpsonii*, Munson. Distinguished by mostly much-cut lvs. on the young shoots and comparatively thin, large, and large-toothed ones on the main shoots, rusty white tomentum below and very prominently brown-tomentose young growths—the character of the lvs. and tomentum varying widely, the foliage sometimes becoming almost blue-green below. Fla.—This is perhaps a hybrid of *V. æstivalis* and *V. candicans* var. *coriacea*. Some forms of it are very like *V. Labrusca*, and might be mistaken for that species. Its botanical position is yet to be determined.

32. *Labrusca*, Linn. (*V. Blandii*, Prince). FOX GRAPE. SKUNK GRAPE. Fig. 1705, Vol. III. A strong vine, climbing high on thickets and trees: young shoots tawny or fuscous, with much scurfy down: lvs. large and thick, strongly veined (especially beneath), broadly cordate-ovate, mostly obscurely 3-lobed toward the top (on strong growths the sinuses sometimes extending a third or even half the depth of the blade, and rounded and edentate at the bottom) or sometimes nearly continuous in outline and almost deltoid-ovate, the petiolar sinus mostly shallow and very open (ranging to narrow and half or more the length of the petiole), the margins shallowly scallop-toothed with mucro-pointed teeth (or sometimes almost entire), and the apex and lobes acute, the upper surface dull green and becoming glabrous but the lower surface densely covered with a tawny white, dun-colored or red-brown tomentum: stamens long and erect in the sterile fls. and (in wild forms) short and recurved in the fertile ones: raceme short (berries usually less than 20 in wild types), generally simple or very nearly so, in anthesis about the length of the peduncle: berries large and nearly spherical, ranging from purple-black (the common color) to red-brown and amber-green, generally falling from the pedicel when ripe, variable in taste but mostly sweetish musky and sometimes slightly astringent, the skin thick and tough; seeds very large and thick. Cent. New England and southward in the Alleghany region and highlands to W. Cent. Ga. Not known to occur west of E. N. Y. in the N., but occurs in S. Ind. and Tenn.—The parent of the greater part of American cult. grapes (probably largely through hybridization). It is often confounded with *V. æstivalis* in the S., from which it is distinguished by the habitually continuous tendrils, the more felt-like lvs. which are not floccose, and especially by the small-toothed lvs., very short clusters, and large berries and seeds.

33. *Piasézkii*, Maxim. (*Ampelopsis Davidiana*, Mott.). A species with variable foliage: dioecious: young branches, petioles, and under surface of lvs.

3965. *Vitis candicans* var. *coriacea*. ($\times \frac{1}{4}$)

rufous-pubescent: lvs. membranaceous, ternate; lfts. petiolulate, the central one rhomboid and more or less lobed and acuminate, the lateral ones obliquely ovate and acute, all of them incised-serrate; cymes many-fl., becoming forking and exceeding the petiole: fls. small, with calyprate petals. W. China. *V. Pagnuccii*, Romanet, differs only in being more glabrescent; probably not distinct.—The foliage of this species-group is said to turn bronze-colored in autumn. The lvs. are very variable, sometimes trifoliate and undivided on the same branch. *V. sinensis*, Hort., appears to belong here.

34. *reticulata*, Pampanini (V. *Wilsonae*, Veitch). Scandent shrub with glabrous branches: lvs. ovate-cordate, subreniform, about 3 in. diam., base cordate-truncate, apex very shortly acuminate, margin entire or inconspicuously 3-lobed, glabrous above, cobwebby on the nerves beneath: infl. racemose: fls. in glomerules, minute: fr. black, but glaucous-pruinose, up to $\frac{1}{2}$ in. diam. China. G.C. III. 46:236.—Promising.

35. *flexuosa*, Thunb. Sts. slender and usually flexuose, glabrous at maturity, the new ones more or less rufous-tomentose: lvs. petiolate, cordate-ovate or triangular-ovate, entire or angular 3-lobed, short-cuspidate, unequally dentate, at maturity glabrous above and more or less hairy or floccose beneath (at least on the veins): fl.-cluster peduncled and branching: fr. very small, 2-3-seeded. China, Korea, Japan. Var. *parvifolia*, Gagnep. (V. *parvifolia*, Roxbg. V. *flexuosa* var. *Wilsonii*, Veitch), is a small-lvd. form, cult. for the color of the lvs., which are purple beneath and bronzy with metallic luster above. China.

36. *amurensis*, Rupr. (V. *vulpina* var. *amurensis*, Regel). A hardy species, well known to botanists but little planted although found in growing collections: sts. obscurely angled and striate, the young shoots loosely floccose or webby, later glabrous or nearly so: lvs. green above and beneath, nearly or quite glabrous, cordate-orbicular, some of them more or less 3-5-lobed, apiculate-dentate: fl.-cluster slender-peduncled: fr. small (about $\frac{1}{2}$ in. diam.), 2-3-seeded. Manchuria, Amoor region. Gn. 54, p. 425. G.Z. 12:160.—It has very ornamental purple-tinted lvs. in autumn.

37. *Thunbergii*, Sieb. & Zucc. (V. *Sieboldii*, Hort.). A variable species resembling V. *Labrusca*: sts. angled, these and other parts rusty-tomentose: lvs. glabrous above, tomentose or pubescent on the nerves beneath, cordate, 3-5-lobed or deeply cut, unequally mucronate-dentate: fl.-cluster shorter than lvs. or about equaling them: fr. very small ($\frac{1}{8}$ – $\frac{1}{2}$ in. long), 2-3-seeded, purplish black. China, Japan. B.M. 8558.—It is the E. Asian representative of V. *Labrusca*. The plant sometimes cult. under this name is probably V. *pentagona*. A form of V. *Coignetiae* passes as V. *Thunbergii* in England.

38. *pentagona*, Diels & Gilg. Climbing, the tendrils interrupted: sts. and lvs. reddish gray-tomentose: lvs. long-petioled, the blade membranaceous, ovate, usually 5-angled, the base truncate or shallowly emarginate, the apex acute, the margin repand and minutely denticulate, lightly pubescent on nerves above but reddish tomentose beneath: thyrses elongated. China.—Allied to V. *lanata*. It appears to have been distributed in cult. as V. *Thunbergii*. Var. *béllula*, Rehd. & Wilson. Lvs. much smaller, 1-2 in. long; very similar to V. *flexuosa* var. *parvifolia*, but lvs. tomentose beneath.

39. *pūlchra*, Rehd. Described as a handsome plant with simple more or less obscurely 3-lobed lvs. coarsely serrate, 7-8 in. long and 9-10 in. broad, much like those of V. *Coignetiae*, villous beneath, the young shoots crimson, the foliage becoming glossy bronze-green and purplish beneath and later deep green. Sts. sparsely floccose, glabrescent, purplish: lvs. ovate to broad-ovate, acuminate, the base shallow cordate or truncate (only rarely deeply cordate), coarsely and unequally toothed, glabrous and somewhat shining above. China or Japan.—Described from plants cult. at the Arnold Arboretum, where it is not quite hardy.

40. *Coignetiae*, Pulliat. Fig. 3966. Very strong-growing vine, covering trees and arbors with a thatch of heavy showy foliage: branches floccose-tomentose when young: tendrils intermittent: lvs. cordate-orbicular, with 3-5 lobe-like points, the margins shallowly apiculate-toothed, dull above, thickly gray-pubescent beneath: thyrses stalked, short: fr. globular, about $\frac{1}{2}$ in.

diam., practically inedible, although said to be eaten after being frozen by the Japanese. N. Japan. Gn. 49, p. 48; 50, p. 449; 63, p. 209. G. 22:523. R.H. 1898, pp. 426-8. G.C. III. 22:305 (adapted in Fig. 3966).—One of the best of all strong-growing vines, and hardy in the northern states; at Chicago recommended as the best vine for large effects. Its foliage becomes brilliant scarlet in the fall, whence it has been called the "crimson glory vine." In general appearance it much resembles Vitis *Labrusca*. In cult. it has been confused with V. *Thunbergii*. It grows readily from imported seeds; it can also be prop. by layering and by grafting on other stocks Named for Mme. Coignet, of Lyons, France.

41. *lanata*, Roxbg. A tropical or warm-temperate variable species, probably not hardy in this country outside the southern parts: sts. and infl. more or less pubescent or tomentose: lvs. 3-6 in. or more long (sometimes very large), sometimes nearly glabrous but

3966. Vitis Coignetiae.

usually soft-pubescent or tomentose beneath, membranaceous, cordate-ovate, short-acuminate, not lobed: fls. small and green, in a panicle cyme, the petals rarely separating at the top: fr. purple, size of large pea, 4-seeded. Himalaya to China.

V. *ácida*, Chapm.=Cissus *ácida*.—V. *aconitifolia*, Hort.=Ampelopsis.—V. *andreaea*, Benth.=Cissus.—V. *Bainesii*, Hook. (Cissus Bainesii, Planch., and by him referred to C. Currori). A most remarkable species, the trunk being condensed into a turnip-like body a few inches diam.: lvs. mostly compound, the 3 lfts. dentate, lvs. all borne on short, succulent branches: tendrils none: fls. greenish, in clusters usually raised above the lvs. S. Afr. B.M. 5472.—V. *Baudiniana*, Brouss.=Cissus antarctica.—V. *betulifolia*, Diels & Gilg. Sts. sparsely white-floccose: tendrils interrupted: lvs. small and membranaceous, becoming glabrous above, tomentose beneath, ovate-cordate and acute, not lobed or only obscurely so, the margin crenate-serrate. China.—V. *bipinnata*, Torr. & Gray=Ampelopsis.—V. *cantonensis*, Seem.=Ampelopsis.—V. *capreolata*, Don=Tetrastigma serrulatum.—V. *Delavayana*, Franch., V. *Delavayi*, Hort.=Ampelopsis.—V. *elegans*, C. Koch=Ampelopsis heterophylla var.—V. *gongyloides*, Baker=Cissus.—V. *Henryana*, Hemsl.=Parthenocissus.—V. *heterophylla*, Thunb.=Ampelopsis.—V. *himalayana*, Laws., and var. *rubrifolia*, Hort.=Parthenocissus, p. 2479.—V. *incostans*, Miq.=Parthenocissus tricuspidata.—V. *japonica*, Thunb.=Cissus.—V. *leucoides*, Maxim.=Ampelopsis, p. 278.—V. *Lindensii*, Hort.=Cissus, p. 776.—V. *megalophylla*, Veitch=Ampelopsis.—V. *oblécta*, Wall.=Tetrastigma.—V. *orientalis*, Boiss.=Ampelopsis.—V. *pterophora*, Baker=Cissus.—V. *repens*, Veitch=Ampelopsis micans.—V. *rubrifolia*, Lév. & Van.=Parthenocissus himalayana var.—V. *semicordata*, Wall., is Parthenocissus semicordata, Planch. (P. himalayana var. semicordata, Laws.). Self-clinging plant: lfts. 3-5, ovate, tapering to summit, the young parts hispid-pubescent. Himalaya.—V. *sempervirens*, Hort.=Cissus striata.—V. *serjanifolia*, Maxim.=Ampelopsis japonica.—V. *Thomsonii*, Laws.=Parthenocissus, p. 2479.—V. *tiliaefolia*, HBK. Mexico, recently intro. for trial: said to have a very sour fr. but useful for jellies: by Planchon referred to V. caribaea.—V. *Titanea*, Hort., described as a vigorous species from Japan: lvs. dark green, with rounded lobes: berries black, in small bunches.—V. *tricuspidata*, Lynch=Parthenocissus tricuspidata.—V. *variegata*, Hort., is likely to be Ampelopsis

heterophylla var.—*V. Voinieriàna*, Balt. Climbing, the tendrils spiral, red-rusty: lvs. persistent, coriaceous, long-stalked, digitate with usually 5 elliptical coarsely dentate lfts. which are glabrous above and bright green: fls. in axillary short-peduncled cymes, hermaphrodite; sepals 4, oval, shorter than the 4 oval-lanceolate separate petals: carpels woolly, with a short 4-lobed style, the 2 carpels biovulate. Tonkin. R.H. 1902, pp. 56, 57. R.B. 28:3. Genus doubtful.—*V. vomerensis*, Hort., "observed in a Nice villa garden:" robust, sts. brown-felted: lvs. large and leathery, deeply cut into fine lobes, brown-tomentose, deep olive-green at maturity.

L. H. B.

VITTADÍNIA (Dr. C. Vittadini, an Austrian who wrote on fungi, 1826–1842). *Compositæ*. Herbs with a thick caudex, or branching subshrubs.

Leaves alternate, entire or variously cut: heads rather small, with a yellow disk and white or blue rays, terminal, solitary or in loose leafy corymbs: involucre of several rows: rays pistillate, numerous, crowded, in more than one row: achenes narrow, compressed or flat, with or without ribs on the faces; pappus of numerous, often unequal capillary bristles.—About 14 species, natives of Austral., New Zeal., S. Amer., and Hawaiian Isls. The genus is closely related to *Erigeron*, differing in habit and in the appendages of the style-branches, those of *Erigeron* being short, while those of *Vittadinia* are awl-shaped. For *V. triloba*, Hort., not DC., see *Erigeron mucronatus*.

austrális, A. Rich. (*V. triloba*, DC., not Hort.). Herbaceous plant of uncertain duration, 1 ft. high or less, tomentose: lvs. obovate or spatulate to linear-cuneate, entire or coarsely 3-toothed or lobed: heads

3967. *Vittaria filifolia*.

solitary: rays narrow: said to be revolute (which may apply only to dried specimens). G.W. 11, p. 129. Austral., Tasmania.—There are botanical varieties.

V. tricolor, Hort., is apparently *V. australis*, A. Rich.

WILHELM MILLER.

VITTÀRIA (Latin, a fillet or head-band or ? *vitta*, a line). *Polypodiaceæ*. A genus of about 40 species of tropical ferns mostly with narrow cord-like lvs. growing pendent from trees: sporangia borne in 2 lines along the margins. *V. lineata*, Swartz, OLD MAN'S BEARD, is a tropical American species which is found as far north as Cent. Fla., where it grows on the cabbage palmetto. Rare in cult. and interesting only as an oddity. *V. filifolia*, Fée. Fig. 3967. A small species, 10–12 in., which is representative in appearance and habit of most of the species; sometimes found in choice collections. Trop. Amer.

L. M. UNDERWOOD.

VOANDZÈIA (from a native name). *Leguminosæ*. One species, *V. subterranea*, Thouars, cult. widely by the natives of Cent. Afr. for its underground peanut-like seeds. It is a prostrate herb with a creeping pubescent rhizome from which arise slender-stalked compound lvs.: lfts. 3, oblong or lanceolate, 3 in. or less long, with minute obtuse stipels: fls. yellow, $\frac{1}{4}$ or $\frac{1}{2}$ in. long, papilionaceous, 1–3 on flexuous peduncles; calyx very small; standard obovate; wings equaling standard, oblanceolate; keel boat-shaped, not beaked; stamens diadelphous: fr. a tuber-like roundish pod, about $\frac{1}{2}$ in. or more long, with 1 or 2 small seeds; the peduncle elongates after flowering and the ovary is buried in the earth, where the fr. ripens; seeds globose-ellipsoidal, about $\frac{2}{5}$ – $\frac{3}{5}$ in. long, yellow-mottled. Until very recently the plant has been unknown in a wild state, but it has now been found natively in Nigeria and German Adamaua (see Kew Bull. 1912, p. 213; and in this article the plant is distinguished from *Kerstingiella geocarpa*, page 1737, another underground legume widely cult. in Trop. Afr.). Voandzeia appears not to have been intro. in this country.

L. H. B.

VOCHÍSIA (*Vochy* is the name of one of the species in Guiana). *Vochysiaceæ*. Glabrous or tomentose usually resinous trees, frequently tall shrubs, occasionally grown in the warmhouse: lvs. decussately opposite or verticillate, usually leathery; stipules small, subulate: fls. rather large, yellow, odorless, in elongated composite racemes or panicles; pedicels 2-bracted; sepals 5, connate at base, lateral and anterior very short, posterior largest, usually spurred; petals 1–3, linear or spatulate, anterior commonly larger than the others; stamen 1, fertile; ovary 3-celled: caps. leathery or woody, 3-celled, loculicidally 3-valved.—About 60 species, natives of Brazil, Guiana, E. Peru, and Colombia. The spelling *Vochysia* is later.

V. ferruginea, Mart. (*V. tomentosa*, DC.). Tree, 25 ft. or more high: lvs. oval-oblong, long-acuminate, attenuate at base, glabrous above, ferruginous-tomentose beneath: fls. in terminal racemes, which are loose and slightly nodding. Guiana.—*V. guianensis*, Aubl. Tree, 12 ft. or more high: lvs. obovate-oblong, shortly acuminate, glabrous on both surfaces: fls. in simple racemes, which are erect, terminal and dense-fld.; spur spreading. Guiana.

VOLKAMÈRIA: *Clerodendron*.

VOLUTARÉLLA (diminutive of *Volutaria*). Syn., *Amberbòia*. *Compositæ*. Erect or divaricately diffuse villous or glabrous annual herbs, sparingly grown in Calif.: lvs. alternate, erose-dentate or remotely pinnatifid: heads heterogamous, outer fls. 1-row, neuter, disk-fls. fertile; involucre ovoid or globose; bracts in many rows, imbricate; corolla purplish, violet, or blue, regular tube slender and very short, limb cylindrical, deeply 5-lobed: achenes obovoid or oblong, prominently 10–15-ribbed. About 7 species, Medit. region, W. Asia, and India. This genus is treated as a part of *Centaurea* by Hoffmann in Engler and Prantl, Pflanzenfamilien IV, pt. 5. *V. muricata*, Benth. & Hook. f. (*Amberbòia muricata*, DC.). St. erect, 1–2 ft. high: basal lvs. lanceolate, attenuate to the petiole; cauline sessile, middle ones auricled, upper and lowest not auricled, linear- or oblong-lanceolate: fls. purple. Spain and Morocco.

According to the Brussel's Congress, *Amberboa* is placed in the list of "nomina conservanda," and if this ruling is followed, the species above mentioned will retake the name *A. muricata*, DC.

VOUÀPA (native name in Guiana). *Leguminosæ*. Unarmed trees, rarely cult.: lvs. abruptly or somewhat odd-pinnately-compound; lfts. sometimes 1 or few-paired, sometimes many-paired; stipules leafy or inconspicuous: fls. yellow, red, or white, small or medium-sized, in terminal and axillary simple racemes or shortly fascicled-paniculate; calyx-tube bearing a disk, short-turbinate, rarely narrow, segms. 4; petals, uppermost clawed, 2–4, lower small, scale-like or none;

perfect stamens 3; ovary stipitate, 3- to many-ovuled: pod obliquely orbiculate, ovate-oblong or falcate, plano-compressed, leathery, 2-valved. About 45 species, Trop. Amer. and Trop. Afr. This is the oldest generic name, but the name *Macrolobium* is retained by the list of "nomina conservanda" accepted at Vienna. *Macrolobium bifolium*, Pers. (*M. Vuàpa*, J. F. Gmel. *Vouàpa bifolia*, Aubl.). 'Tree, about 10 ft. high: lfts. sessile, ovate, acuminate, oblique: fls. violet; calyxlobes spreading; stamens nearly equaling the corolla. Guiana.

VRIËSIA (named for Dr. W. de Vriese, of Amsterdam). *Bromeliaceæ*. Often spelled *Vriesea*, but not so spelled by Lindley, who founded the genus. Tropical American stiff-leaved plants, with mostly distichous spikes bearing large and showy bracts. According to Mez (DC. Monogr. Phaner. 9), 84 species are to be referred to this genus. They are very like tillandsias, with which they are united by Bentham & Hooker and others. The chief technical difference is the presence in *Vriesia* of 2 ligules or a single cleft or emarginate ligule on the inside of the base of petals. Culturally, *vriesias* are like tillandsias. They run to forms with marbled and banded lvs. Several species have been intro. in recent years, and many garden hybrids have been produced. Few kinds are offered in the American trade, and only these kinds are described here. For other kinds, see the monographs of Baker and Mez; also the accounts from time to time in horticultural publications. For cult., see *Tillandsia*.

A. Stamens longer than the petals.

B. Infl. branched.

Saundersii, Morr. (*Tillandsia Saundersii*, C. Koch. *Encholirium Saundersii*, André). About 1½ ft. high when in bloom: lvs. many, in a rosette, rather short, strongly recurving, grayish and somewhat white-dotted above, spotted with red-brown beneath: fls. in a branched open infl., sulfur-yellow, cylindrical in form. Brazil. I.H. 20:132.

BB. Infl. simple.

C. Bracts of infl. strongly imbricate.

speciosa, Hook. (*Tillandsia splendens*, Hort. *T. picta*, Hort. *T. zebrina*, Hort., in part). Fig. 3968.

3968. *Vriesia speciosa*.

Strong-growing plant, with broad, strong, arching-ascending lvs. 1 ft. or more long, which are bright green and marked with dark brown transverse bands: spike with densely imbricated bright red acuminate bracts, the scape spotted: fls. exserted, yellowish white. Guiana. B.M. 4382. F.S. 2:107; 6, p. 162. R.H. 1846: 41. F.W. 1874:33 (as *V. brachystachys*).—One of the best and most showy species. A robust form is var. **majör**, Hort. See supplementary list below for additional note on *V. zebrina*.

3969. *Vriesia carinata*.

carinata, Wawra (*V. brachystachys*, Regel. *Tillandsia carinata*, Baker). Fig. 3969. Lvs. rosulate, about 6 in. long, the base sheathing, mucronate at the tip, somewhat glaucous, not spotted: spike with wide-spreading nearly divaricate acuminate bracts which are scarlet at the base and yellowish green at the end: fls. protruding, pale yellow. Brazil. B.M. 6014.

CC. Bracts of infl. remote, not imbricate.

guttata, Lind. & André (*Tillandsia guttata*, Baker). Lvs. rosulate, erect-arching, short and rather broad, mucronate, olive-green with irregular spots of brown-purple: bracts farinose, rose-colored, the scape slender: fls. yellow. Brazil. I.H. 22:200.

psittacina, Lindl. (*Tillandsia psittacina*, Hook.). About 1 ft. high when in bloom: lvs. rosulate, 6-10 in. long, dilated at the base, yellowish green: fls. large, yellow with green tips, scattered on a distichous spike, the bracts red at the base and yellow at the top. Brazil. B.R. 29:10, where the genus is founded. B.M. 2841. R.H. 1855:221.—A showy species when in bloom.

AA. Stamens shorter than the petals.

B. Lvs. not barred, mottled, or tessellated.

heliconioides, Lindl. (*V. bellula*, Hort. *Tillandsia heliconioides*, HBK.). Dwarf and tufted, with many rosulate recurving or arching lanceolate lvs. (about 12 in. long) which are bright green above and purple-tinged beneath: scape overtopping the foliage, simple and erect, with wide-spreading distichous boat-shaped bracts that are light red at the base and greenish at the tip, showy: fls. white. Colombia. I.H. 30:490. G.C. II. 21:140.

BB. Lvs. tessellated (marked in small checkerwork) or minutely variegated.

tessellata, Morr. (*Tillandsia tessellata*, Lind.). Lvs. short and rather broad, rosulate, dilated at base, short-pointed, rather stiff, channeled, tessellated with green and yellow: infl. paniculate, the greenish bracts remote: fls. yellow. Brazil. I.H. 21:179. R.H. 1889, p. 573.

fenesträlis, Lind. & André (*Tillandsia fenesträlis*, Hook. f.). Robust, densely tufted, the lvs. stout (1-2 ft.

long) and recurved, brown-tipped, with many dark green veins and cross veins: infl. a simple stout spike $1\frac{1}{2}$ ft. long and bearing green-spotted bracts: fls. pale yellow. Brazil. B.M. 6898. I.H. 22:215.

BBB. Lvs. marked with strong transverse bands.

hieroglyphica, Morr. (*Tillandsia hieroglyphica*, Bull.). Fig. 3970. Lvs. many, rosulate, stout, recurved, short-acute, very strongly and irregularly marked and banded with dark green above and brown-purple beneath: infl. paniculate, the bracts broadly elliptic-ovate, the fls. yellowish. Brazil. I.H. 31:514; 42, p. 318. R.H. 1891:400. Gn. 37, p. 244 (adapted in Fig. 3970).—A very striking and showy plant. Sometimes known as a *Massangea*.

V. Blokii, Hort. (*Tillandsia Blokii*, Hort.). Infl. crimson, pinately paniculate, 4–5 ft. tall; floral bracts ovate: fls. in 2 rows, 4 in. long; petals yellow, linear, about 4 in. long. S. Amer. B.M. 8192. G.C. III. 45:358.—*V. fulgida*, Hort., has been catalogued in this country. It is a garden hybrid (*V. incurvata* × *V. Duvalii*). It has short green lvs. and an exerted simple spike with distichous bright red imbricated bracts. I.H. 35:67.—*V. glaucophylla*, Hook., is *Tillandsia fasciculata*.—*V. Leopoldiana* = *V. splendens* × *V. Malzinei*. Gt. 54:1539.—*V. muscica* = *Guzmania*.—*V. regina*, Ant. Lvs. very long-acute: infl. large; bracts elliptic-ovate, rounded at apex: fls. dirty yellow. Brazil.—*V. Rex*. Hybrid. R.H. 1907:570.

—*V. zebrina*, Hort., is sometimes *V. splendens* and sometimes *Cryptanthus zonatus*. L. H. B.

VULNERARIA: *Anthyllis*.

VUYLSTEKEARA, a multigeneric orchid hybrid embracing *Cochlidia*, *Miltonia*, and *Odontoglossum*. It bears the name of Charles Vuylsteke, of Ghent, Belgium, and the name is conformable with *Adamara*, *Linneara*, *Lowiara*, *Wilsonara*. Only two species or species-forms (very recent) are recorded, the first of which has been in doubt as to parentage. These are *V. insignis*, Hort., recorded (G.C. III. 56:14) as a hybrid of *Miltoniada Bleuana* and *Odontioda Charlesworthii*, bearing cream-white fls. with brownish spots; and *V. Hyeana*, Hort., a hybrid between *Odontonia Lairessezii* and *Cochlidia Noezliana*, with fls. 2 in. across with a cinnabar tint suffusing the greater part of the surface of the sepals and petals after the color of *C. Noezliana*, but with the form of fl. approaching *O. Lairessezii* especially in the center of the labellum, which is white tinged rose-color, and the base having a crest of yellow ridges on a red ground in front of which is a large shining brownish yellow raised blotch similar to that in *Miltonia Warszewiczii*.

3970. *Vriesia hieroglyphica*.

W

WAHLENBÉRGIA (named after Georg Wahlenberg, 1780–1851, Swedish botanist). Including *Edraianthus* (*Hedraanthus*). *Campanulaceae*. Annual or perennial herbs, base of the stems sometimes woody, used as greenhouse and border plants, mostly the latter.

Leaves alternate, rarely opposite; infl. usually irregularly centrifugal; peduncles terminal, lateral or axillary, solitary or rarely paniculate; fls. usually blue and nodding; calyx-tube adnate, hemispherical, turbinate or obconical-oblong, limb 5-parted, very rarely 3-4-merous; corolla campanulate, funnel-shaped, tubular or rather rotate, 5-cleft, very rarely 3-4-cleft; ovary inferior or semi-superior, 2-5-celled; caps. erect, loculicidally 5-valved.—About 110 species, Eu., Medit. region, S. Afr., and Trop. Amer. This treatment includes *Edraianthus*, which is often kept as a distinct genus. The species are used mostly as rock-garden plants, and receive the treatment given campanulas.

A. Plants with clustered tubers.

tuberōsa, Hook. f. Glabrous, with clustered, above-ground tubers: sts. slender, erect, 6–24 in. high, branched and leafy: lvs. about 1 in. long, linear, acute or obtuse, dentate, 1-nerved: fls. in a terminal panicle, white, red-purple-veined; calyx-lobes linear, spreading; corolla campanulate, lobes short and recurved. Island of Juan Fernandez. B.M. 6155. G.Z. 21, p. 217.

AA. Plants without clustered tubers.

B. Lvs. basal clustered, narrow: plants perennial. (Section *Edraiantha*.)

c. Fls. solitary on the peduncles.

serpyllifolia, G. Beck (*Campanula serpyllifolia*, Vis. *Edraianthus serpyllifolius*, A. DC.). Fig. 3971. Sts. cespitose, procumbent, glabrous: lvs. oblong-lanceolate, obtuse, ciliate: fls. solitary, on sts. about 2 in. high, deep purple; calyx-tube ovoid, rather glabrous, lobes ovate-lanceolate; corolla campanulate. Dalmatia. G.C. III. 45:243. G. 36:143. Gn. 75, p. 103. Var. *dinārica*, Hort. (*W. dinārica*, Hort.), has narrow silvery lvs. and blue fls. G.M. 58:285. Var. *mājor*, Hort., is slightly larger than the type. Gn. 78, p. 338.

cc. Fls. several to numerous on the peduncles.

dalmática, A. DC. (*Edraianthus dalmaticus*, A. DC.). Sts. ascending or erect, about 3 in. high, glabrous: lvs. linear-lanceolate, entire, hairy-ciliate, 1–2 in. long: fls. in a terminal 6–10-fl. head, blue; calyx-tube rather pilose, lobes triangular; corolla-lobes acute. Dalmatia. G. 36:142.

Pumilio, A. DC. (*Edraianthus Pumilio*, A. DC.). Cespitose: sts. very short, leafy: lvs. linear, entire, about ½ in. long, glabrous beneath, pilose above: fls. numerous, azure-blue; calyx-tube obconical, glabrous, lobes lf.-like; corolla-lobes ovate, acute. Dalmatia. G.C. III. 53:59. G.W. 15, p. 345.

3971. *Wahlenbergia serpyllifolia*. (×½)

BB. Lvs. alternate or opposite and narrow, scattered along the sts.: plants usually annual.

c. Blades nearly rotund.

hederācea, Reichb. Sts. filiform, creeping or ascending, branched, 4–10 in. long: lvs. long-petioled, cordate, obtuse, 5–7-angled, nearly rotund, about ½ in. diam.: fls. few, terminal, pale blue-lilac; calyx glabrous, tube hemispherical, lobes linear-subulate; corolla-lobes ovate, acute. Eu.

cc. Blades linear to lanceolate or narrowly obovate.

grācilis, Schrad. (*W. vincæflōra*, Decne.). Sts. simple or branched, 6–12 in. high, erect or somewhat decumbent: lvs. alternate or subopposite, linear-lanceolate, sinuate-dentate, about ½ in. long: peduncles terminal or axillary: fls. blue; calyx rather glabrous, tube ovoid, lobes acuminate; corolla-lobes ovate, acute. Tropical and south temperate regions of the Old World. G.C. III. 52:215.

saxicola, A. DC. Sts. short, tufted, 1 in. or more long: lvs. clustered, petioled, obovate or spatulate to almost linear, ½–1 in. long: scapes 1-fl., 2–6 in. high: fls. white, veined with blue; calyx glabrous, lobes narrow-triangular; corolla-tube purplish outside, lobes oblong, broadly deltoid, acute. Tasmania. G. 37:21. Gn. 65, p. 269.

W. gentianoides, Hort., is offered in the trade as a rock-plant growing a foot high, with erect wiry sts. and bright blue fls.—*W. grandiflōra*, Schrad., is *Platycodon grandiflorum*.

F. TRACY HUBBARD.

WĀITZIA (F. A. C. Waitz, born 1768, at Schaumburg, Germany, state physician to the Dutch at Samarang, Java; wrote on Javanese plants). *Compōsitæ*. Includes one of the rarer "everlasting flowers," a half-hardy annual which bears flat-topped clusters of yellow flower-heads, with a golden disk.

Mostly annuals: lvs. alternate, linear or nearly so: fl.-heads in terminal corymbs or rarely in oblong leafy racemes: involucre various in outline, the bracts overlapping in many rows, all colored and petal-like: receptacle flat, without scales: anthers provided with tails of very small size: achenes somewhat compressed, glabrous or papillose, terminating in a slender beak; pappus of capillary bristles usually cohering at the base, simple, barbellate or plumose.—Seven species from Austral. The genus is distinguished from *Helip-terum* and *Helichrysum* by the beaked achenes.

grandiflōra, Naudin. Half-hardy everlasting or "immortelle," annual, exceeding 18 in. height: lvs. lanceolate, long-acuminate, sessile, green above, slightly villous beneath, prominent midrib beneath: fls. yellow, in terminal corymbs; clusters about 5 in. across, and heads 2 in. across, the showy part being the involucre bracts, which are arranged in 4 or 5 series, and are petal-like in character but of stiffer texture than ordinary petals. F. 1865:41, where it was originally described.—Probably the most desirable of the genus.

It seems to have replaced *W. aurea*, Steetz, the favorite of a former generation, being larger-flid., more robust, and rather easier of cult.

WILHELM MILLER.

WAKE ROBIN: In England, *Arum maculatum*; in America, *Trillium*.

3972. Yellow or barren strawberry.—*Waldsteinia fragarioides*. (X 1/2)

WALDSTEINIA (named after Franz Adam, Count of Waldstein-Wartenburg, born 1759 at Vienna; wrote with Kitaibel an illustrated work on rare plants of Hungary; died 1823). *Rosaceæ*. Creeping herbs with the habit of *Fragaria*, perennial and hardy, used in the border as an edging and on rockeries.

Leaves mainly radical, 3-5-lobed or -divided: fls. small, yellow, borne on bracted scapes; calyx-tube inversely conical, limb 5-cleft, with 5 often minute and deciduous bractlets; petals 5; stamens many, inserted into the throat of the calyx: achenes 2-6, minutely hairy.—About 5 species, Cent. and E. Eu., N. Asia, and Temp. E. N. Amer. Of simple cult.

The yellow or barren strawberry, *W. fragarioides*, is a little plant that looks much like a slender strawberry but it has yellow flowers and bears no edible fruit. It is a hardy North American tufted perennial herb, about 4 inches high, with glossy leaves composed of three wedge-shaped leaflets, and five-petaled flowers less than 1/2 inch across. It comes with the first rush of spring, and continues to bloom until summer. There is little satisfaction in growing only a few plants of this wild flower. The plant is appropriate to the rockery, where every effort should be made to induce it to form a large mat. Masses of the yellow strawberry have been used with good effect for edging shrubbery borders, and the plant is listed in the trade.

fragarioides, Tratt. Fig. 3972. Pubescent or nearly glabrous: lfts. dentate or crenate except at the base, 1-2 in. long: scapes corymbosely 3-8-flid.: achenes 4-6. May, June. Woods and shaded hillsides, New England to Minn. and Ind., along the Alleghenies to Ga. B.B. 2:218. R.H. 1890, p. 510. B.M. 1567 and L.B.C. 5:408 (both as *Dalibarda fragarioides*).

sibirica, Tratt. (*W. trifolia*, Rochel. *W. trifoliata*, Steud.). Sts. creeping, pilose, leafy at their tip: lvs. erect, alternate, petioled, ternate; lfts. very short-petioluled, obovate, base cuneiform, entire; stipules none; scapes 1 or several, axillary, 3-5-flid.: fls. hermaphrodite, nodding, white; calyx-lobes ovate; petals spreading, subrotund. Siberia. J.H. III. 45:217.

lobata, Torr. & Gray. Foliage slightly hairy; lvs. cordate, 3-lobed, the lobes crenate with mucronulate teeth; petioles slender, longer than blades: scapes about as long as lvs.: sepals triangular-lanceolate, acute; petals narrowly oblong or elliptic: achenes usually 2, densely pubescent. S. W. Ga. F. TRACY HUBBARD†.

WALKING-LEAF FERN: *Camptosorus*.

WALKS, PATHS, AND DRIVEWAYS. That gardens and grounds may be reached at all times in any weather, walks are introduced to afford dry comfortable routes. They should be laid out to conform to and emphasize the garden design. However, too much gravel or a too complicated system will mar the purpose and scale of the garden and detract from its charm. It is necessary, therefore, that the paths be kept in proportion by adopting various widths according to the amount of travel expected and the importance of certain lines in the design. Principal lines or "axes" of the design may be emphasized by widths of 6 to 14 feet; secondary by 4 to 8 feet; minor, 2 1/2 to 4 feet. It may be added that straight paths should be wider proportionately than curving ones. Paths may also be maintained in scale by use of different materials, using stone or brick for the principal ones; gravel, tanbark, or stepping-stones for secondary; grass for the least important. The color of path material also influences the garden appearance, and the simpler the garden character the less pronounced should be its path-colors. Turf is the least and cement the most conspicuous of materials.

Grass paths should be designed for unusual wear, and a depth of at least a foot of well under-drained soil provided. Many simple gardens have turf paths only, but these are at a disadvantage in wet weather or dew. If the wear is more than grass will stand, or the garden lines need more emphasis, stepping-stones may be introduced in the grass. (Fig. 3973.)

Stepping-stone paths are simplest made of native rock of irregular shapes (Fig. 3974); more refined if of native rock, hammer-dressed; and still more refined if of regular blocks, slate, flag, or cement, (12 by 12 inches) square, or (12 by 24 inches) rectangular (Fig. 3974). The stones should be set 20 inches apart,

3973. A good garden walk.

center to center, well bedded in earth, and level with the sod.

Tanbark paths, grass-bordered, are a degree more pronounced. The tanbark should be spread 2 inches thick over a bottom of 6 to 12 inches of broken stone or cinders. If the path is of such importance to the

3974. A, Stepping-stones in the grass—the simplest dry path in the natural style. B, The same, conventionalized for the formal style.

design as to demand greater width, the character should change, and gravel or crushed stone be used.

For macadam paths (Fig. 3975) excavate 8 inches at the sides, 6 inches in center, and lay 5 inches of stone or "spawls" on edge across the path. Over this spread 2 inches of crushed stone the size of a hen's egg ($1\frac{1}{2}$ -inch stone) and a sprinkling of clayish soil, and roll firm, a hand roller being used. An inch of crushed limestone or hard shale should then be spread and rolled until a firm hard surface results. The walk should be raised 1 inch at the center for each 2 feet of width. These hard walks must be contained by borders of grass sod, boxwood, stone, brick, or cement curb. The curb should stand only 1 inch above the walk-surface; it should be $2\frac{1}{2}$ inches wide for a 4-foot path and $\frac{1}{2}$ inch wider for each added foot width of the walk up to 4 inches, which is sufficient for a highway.

Gravel paths appear well up to any width, but as they are widened their color increases in design importance. Many garden designers use red gravel only; others prefer blue trappe rock; few use washed beach gravel or other white surface material because of its glare. This fault is a grievous one with respect to cement as a walk material; it also seems too artificial and not gardenesque.

Brick in various colors and textures is an old and valuable path material which meets the requirements of color, texture, interest, drainage, and neatness, as well as anything yet devised. The pattern of laying should not be complicated to the degree of attracting attention which should be bestowed on the garden itself. In front of seats or steps, about a pool or a

garden dial, it may be embellished by special design or by tile introduced into the pattern. Usually the patterns are three, or adaptation of those shown in Fig. 3976. A tile effect can be secured by using extra-wide joints, but glazed tile will be found too slippery for out-of-door use. Brick walks should be laid over a foundation of 16 inches of cinders or broken stone, for drainage and to prevent heaving by frost. To lay "dry," an inch of sand is spread upon this foundation, the bricks laid and afterward swept over with sand until joints are filled. If a cemented job is desired, spread 3 inches of concrete upon the "frostproof" foundation; lay the brick upon a layer of cement mortar spread above the concrete, and pour the brick joints afterward with cement (one part), sand (one part); scour the bricks with muriatic acid, one part to ten of water.

Much may be said in favor of stone paths. It is a material full of interest and generally harmonizes well in garden or lawn. The stones, as a rule, should be larger if the walk or terrace is wide or long. They may be laid regularly or irregularly (Fig. 3977); smooth or rough of surface; cemented joints over foundations as for bricks; or laid with grass joints. These last are very gardenesque, particularly if the joints are planted with low-lying perennials like *Sedum acre*, *Armeria vulgaris*, certain saxifragas, and *Veronica rupestris*. Such a walk is not easy to keep free of either snow or heavy dew, so that it must not be laid where service demands dryness.

In the English or natural landscape style, lawns and informal gardens are made up of grass, shrubs, trees, and vistas. Paths are introduced for the sole purpose of giving easy access to various points or objects of interest and are not relevant, as in formal gardens, to the design. On the other hand, it is easy to intercept and spoil a vista, subdivide charming greensward, or mar a graceful slope by introducing a walk. Considerable study is required to lay out paths which will be direct, serving the practical needs of the place without interfering with esthetic considerations. Usually it is best accomplished by keeping paths somewhat toward boundaries, and consisting of graceful long curves in harmony with the general rounded outlines of foliage, foregrounds, and slopes in hillsides, rather than by more conventional straight lines, directed through centers. These paths must not seem circuitous or precipitous, however, and the interest must be satisfying to the traveler by presenting special vistas, close examination of interesting plantings, providing good restful benches, passing through arches or otherwise made interesting and seemingly short. Paths of this character must not be laid out in an unrelated system nor built simply to break up lawns and afford aimless strolls. It should not often be necessary for the traveler to return the way he came along a path, at least any distance, and even in small

3976. Forms of simple brick walks. a, Basketry pattern; b, straight herringbone; c, herringbone, corner cutting required but effectiveness of pattern increased; d, basket, with Roman (or extra-size) brick.

3975. Gravel or macadam walk.

grounds a full circuit should be devised, or else no path-scheme laid out at all. When crossing a vista, as is often necessary to secure directness or continuity, the path may be graded lower to obscure its course (Fig. 3978), or it may be of an inconspicuous material such

3977. Forms of stone paths of a gardenesque appearance. A, grass or flower joints; B, cement joints; C, cobbles and stones in cement.

as a blue slate, brown stones, or dark stepping-stones with grass joints (Fig. 3973).

The materials of such lawn-paths may be simply of turf when passage is through woods or meadows. This latter charming device is secured by mowing a strip through the longer meadow grass and daisies. Macadam or gravel is usually the method of construction.

For crowded parks, the width should be 8 to 12 feet or more. The construction may be heavier by 2 inches, and special care given to drainage. Oiled macadam, valuable for roads, is not suitable for paths unless top-surfaced with fine screenings to prevent tracking the oil.

Asphalt paths are sometimes used and are best if the residuum used in the flux of the surface coat be reduced to the minimum in order to leave as hard a pavement as possible. Concrete is being more generally used because of its wearing properties. It should be colored with red ochre, and lamp-black to destroy the usual whiteness of cement surface. These walks may be constructed in the usual way (8 inches cinders, 3 inches concrete, 1 inch cement float), except that the surface should be rough finished—neither troweled nor rolled. Wing walks at each side of the cement may often be provided to good advantage. They are 2 to 4 feet wide, made of 4 inches of gravel (or crushed stone) laid upon 6 inches of cinders or broken stone.

Drainage should be provided for all paths. Brick, asphalt, or cement walks should be crowned in the center or on the high side. Three-fourths of an inch is sufficient for an 8-foot cement walk. At each side, or at the upper side at least, of paths on a slope, drainage should be provided by sod gutters. These will carry the surface water to park inlets which discharge into sewer lines.

Driveways.

If walks and drives were not necessary to a human use of the informal type of landscape, they would never be put into it. Drives should be regarded as secondary, not primary elements of beauty in this style of gardening and they should remain unobtrusive by direction, width, and material. But as the landscape becomes more formal, drives become increasingly important and prominent in the design. It is simpler to plan a straight avenue in the formal balanced lawn of a house with terrace and gardens in a straight line swung on evident axes than to observe the indefinite lines, the less apparent unity and balance of informal gardening and incorporate therein a wide roadway. A straight formal drive should not be intruded through

an informal lawn, or an irregularly curved and planted road through a formal place.

As elements of beauty, roads are tolerable only as they serve their purpose thoroughly well. This purpose may be a service-way to the kitchen, when directness is the first consideration; or to the front door, when good views of the house and lawn may warrant more indirectness; or a pleasure-drive, where directness is lost sight of, and good views, interest of scenery, and gradient become all-important. Success in laying out driveways depends on skill in applying the principles of landscape design, with a true regard for grades and excellence of construction. Mere engineering skill will not attain good private or park drives, for part of the function of such roads is to harmonize as far as possible with the other elements of the created or natural landscape.

Practical reasons urge a principal entrance toward the most-used corner of the property. As far as possible, the natural inclination for "short cuts" should always be recognized. Neither straight lines nor tire-

some turnings are esthetically pleasing; grades must be considered and fine existing natural features, trees, rocks, and the like usually avoided. The driveways should command interesting views ahead and to the side and attract attention to handsome plantings in the curves. The curves should always be directed toward and not away from the

objective point, and circuitousness for sake of adding mere length to the approach should be avoided.

To be comfortable as well as practicable, the gradient should be as low as about 6 per cent (6 feet of rise in 100 of length), at turns never over 7 per cent, although 10 or 12 may be required elsewhere to accomplish the ascent. Transition from one slope to another must be

carefully arranged so as to avoid sharp jolts (Fig. 3979); this is accomplished by filling the hollows or cutting off the crests where the grades reverse. There should always be a flat place in front of doors and at entrances. Road-curves should be long, at least

equal to 60 feet radii. It is an advantage to plot the curves at least roughly upon the ground first and transfer them to paper rather than vice versa, as their true artistic and practical effect may be perceived better. Long stakes should be used to aid the sight or a coil of rope laid upon the ground, and moved about until the desired line is attained, then the rope staked.

3978. Walk crossing a lawn in slight depression for concealment.

3979. Transition of grades. Method of sighting by stakes and twine.

3980. Planting of curves, and free views. Entrance at right angle to highway.

3981. Branching of road.

By tying colored twine around the stakes and moving it up and down while sighting, the new grades may also often be visualized. In cleared ground this method is very sure. It is better than the engineer's method of regular curves connected by straight tangents.

Precaution should be exercised at curves and intersections to secure safety as well as appearance and convenience. The fast-moving almost noiseless modern vehicles emphasize this precaution; therefore the view ahead at sharp turns should always be unbroken by banks or dense, tall plantings (Fig. 3980). Drives should branch on the outside (A) not inside (B) of curves (Fig. 3981). Danger lurks in narrow branchings and may be avoided by widening the intersecting triangle (Fig. 3982). Small triangles at right-angle intersections are not to be advised. When used at all they should be large and clear of tall planting which obscures the view. Triangles with less than 50-foot sides may better be omitted altogether (Fig. 3983).

At the turn-in from the public road especial care must be exercised to avoid danger. The acute angle (A) is bad (Fig. 3984); and the corner entrance (B) is not much better, or is absolutely fool-hardy when arranged as C. The best turn-in is shown at D. When possible, enter from an outward bend of the public road (Fig. 3985) or at the head of the street (Fig. 3986), and always at nearly right angles to the public road (Fig. 3980), making a gradual bend, if desired, to an angle within the property. Avoid if possible the street entrance at the foot of a steep hill as it is the point of greatest speed. Formerly entrances were heavily emphasized by gate-piers, lodges, and tree-plantings; now they are recessed and the planting is less high.

The road-surface should be smooth, dry, elastic, clean, and of good color. All this is to be obtained by various constructions. The gravel roadway is always pleasing as to color and wear, but the present-day macadam, although somewhat lacking as to color,

3982. Widening the intersecting angle of a road.

better withstands modern traffic. Brick, concrete, and asphalt are too noisy and seem too hot and formal for private roads in the country, although for short distances in the city they may be used properly.

The construction of any roadway is begun by grading the level for the bottom of the road. This is called the sub-grade and is made higher in the center than at the sides by $\frac{1}{2}$ inch or more to each foot width. The sub-grade should be rolled before the stone is laid. For private drives generally a light Telford consisting of native stone, about 6 inches wide and 1 to 3 inches

thick, is laid by hand upon edge crosswise of the road. Over this a sprinkling of clay soil is thrown and covered 2 inches deep with crushed stone of the $1\frac{1}{2}$ -inch grade; this in turn is covered by an inch of crushed limestone screenings. Each course as laid is sprinkled and rolled with a six- to ten-ton steam roller. This is a water-bound macadam. (Fig. 3987 A.) Since it does not

withstand automobile traffic without dust, various oil-binding treatments of the surface are on the market. Bitulithic macadam is an excellent method of binding the top courses together, with hot pitch applied under pressure. There is no tracking of oil when this method is practised and the color and texture are satisfactory. Local conditions so influence materials and methods that it is necessary to investigate before applying any general specification in detail.

A cheaper road (Fig. 3987 B) may be built of spawls, or other broken stone, spread evenly, rolled, and surfaced with the other two courses of crushed stone, each thoroughly rolled wet. Where gravel of a cementitious quality is obtainable, or a hard shale, it may be substituted for crushed limestone surfacing.

3983. Driveway with and without an undesirable triangle.

3984. Good and bad entrances from the public road.

3985. A good entrance from an outward bend of the road.

The earth road has its country uses. Its success depends on dryness, and this is brought about by wide ditching at the side, a rather high crown in the center, and puddling the surface by repeated dragging while in a wet condition. The turf road (Fig. 3987 C) in country estates, for occasional travel, is made by laying

3986. A good entrance at the head of a street.

roundish stone without "chinking in" the interstices. Cover with soil 1 inch thick over top of stone and seed with grass.

Whatever material the road is made of, it should be of convenient although not of unnecessary width, 9 feet for a single suburban lot being sufficient, 13 to 16 feet, including gutters, for more pretentious places, 14 feet for the little-traveled by-roads in parks, and 22 to 30 feet for the principal drives, and 60 to 80 for boulevard widths. The roads should also partake of the decoration suited to the large feeling of the place. Such accessories as gutters and inlets, signs and light-posts, entrance-piers and gates, should be rustic or more refined, carved or conspicuous in proportion as the surroundings have been conventionalized. Roads must harmonize and obey the demands of unity in design. The use of roadside shrubbery and arrangement of taller-growing trees is the means whereby the designer may tie together an artificial road to the landscape.

ARTHUR W. COWELL.

WALLFLOWER. The vernacular name of *Cheiranthus Cheiri*, which see. A favorite spring bloom in Great Britain, and sometimes secured as early as Christmas; in this country it is little known, probably because of climatic reasons.

3987. Types of road construction: A, macadam; B, broken stone; C, turf; 1, sod gutter; 2, gutter; 3, stone curb; 4, cinders; 5, screenings; 6, 1 1/2-inch crushed stone; 7, Telford; 8, screenings or gravel; 9, spawls.

The wallflower is a perennial, blooming profusely the second year, but needing to be renewed frequently. The compact forms grow only 1 foot or 18 inches high, but some kinds are taller than this. There are single-flowered and double-flowered kinds, and colors in yellow, orange, blood-red, maroon-red, yellow-brown, light brown, ruby-purple, pink. The yellows are most commonly seen in English gardens, and make a most attractive show about cottages in early spring. The double kinds are propagated by cuttings taken in spring, and they make good blooming plants the following spring if not allowed to become stunted; double wallflowers are also grown from carefully selected seeds. The seeds of wallflowers may be sown in spring and plants are kept in vigorous condition until protected for the winter; they are transplanted when young into permanent beds. If seeds are started in late winter, bloom may be had in the following holidays, in a climate mild enough to carry them.

WALLÍCHIA (Nathaniel Wallich, 1786-1854, Danish botanist; wrote on plants of India). *Palmáceæ*. Stove palms, one of which, the first described below, is cultivated outdoors in southern Florida and southern California and in Europe under glass, and the second, while not advertised in America, is probably in a few northern greenhouses.

Low palms, caespitose, with short branching caudices, or in 1 species tall: lvs. densely fasciculate, terminal, distichous, scaly, unequally pinnatisect; segms. solitary or the lowest in groups, cuneate at the base, oblong-obovate or oblanceolate, erose-dentate, the terminal one cuneate; midnerve distinct; nerves flabellate; margins recurved at the base; petiole slender, laterally compressed; sheath short, split, with the margins deeply crenate; spadices short-peduncled, the staminate drooping or recurved, ovoid, much branched, densely fld., the pistillate looser, erect; spathes very numerous, slender-coriaceous, the lower ones the narrower, tubular, the upper ones cymbiform, entire, imbricated: fls. symmetrical, the pistillate much smaller than the staminate, yellow: fr. ovoid-oblong, red or purple.—Three species, Himalayas. *Wallichia* is allied to *Didymosperma*, *Arenga*, and *Caryota*, differing in having 6 stamens instead of an indefinite number. *Caryota* is the only one of this group with ruminant albumen. *Didymosperma* has a cup-shaped 3-lobed calyx, and in *Arenga* the calyx has 3 distinct sepals.

disticha, T. Anders. Fig. 3988. Caudex 10-15 ft. high, about 5-6 in. diam.: lvs. graceful, 6-10 ft. long, alternate, erect; lfts. 1-2 ft. long, 2-2 1/2 in. wide, fasciated, linear, narrowed to the base, denticulate at the apex, with a large tooth on each side above the middle, glaucous beneath; petiole and sheath short, scurfy; lvs. disposed in a one-third spiral: spadix 3-8 ft., the staminate usually twice as long as the pistillate: fls. in many spiral series, green. Himalaya.

caryotoïdes, Roxbg. (*Harina caryotoïdes*, Buch.-Ham. *Didymosperma caryotoïdes*, Hort.). St. very short or none, often sheathed with the persistent lf.-bases: lfts. oblong or linear-oblong, panduriformly excised and acutely toothed, white beneath: spadix about 18 in. long, the fls. purple or yellow, according to sex. F. 1874, p. 161. R.H. 1870, p. 368.

W. densiflora, Mart., a palm like *W. caryotoïdes* and differing only in technical ovary characters, is offered in Eu. Unknown in Amer. J.F. 3, pls. 233, 234.—*W. porphyrocarpa*, Mart. See *Didymosperma*.

JARED G. SMITH.
N. TAYLOR.†

WALNUT (formerly sometimes written *wallnut*, but the name has no connection with *wall*, being rather of Anglo-Saxon derivation signifying "foreign nut," as the product came from the continent). A name applied to *Juglans regia* and its fruit, to us known mostly as

English walnut because the supply yearly reached America through England; also, by extension, to other species of the genus *Juglans*. The name is sometimes, but provincially, given to hickory-nuts.

The walnuts may be thrown into three horticultural groups: (1) The Persian or English domesticated species, *Juglans regia* (Fig. 3989), the walnut of commerce and of extensive cultivation in California and other parts of the United States. (2) The North American walnuts, of several species but chiefly known in the black walnut, *J. nigra* (Fig. 3990). (3) The East Asian walnuts, represented by *J. Sieboldiana* and allies, promising but yet little grown in this country. To the genus also belongs the butternut, *J. cinerea* (Fig. 3991), sometimes called white walnut. There is much promise of important cultural races in the species of *Juglans*, but the markets yet know practically only the nuts of *J. regia*. See *Juglans*, Vol. III.

L. H. B.

The walnut in California.

The extent of the present Persian or English walnut (*J. regia*) industry of California amounts to between 45,000 and 50,000 acres, or about 1,250,000 trees. An average crop for the past few years is about 12,000 tons, valued at \$3,500,000. The crop for the year 1915 equaled 14,300 tons, valued at approximately \$4,250,000 to the growers. The investment in the walnut industry of California represents about \$45,000,000.

English walnuts may have first been planted in California by the Mission Fathers. However, it was not until after the coming of the first Americans that this industry attained any commercial importance. The present walnut industry is of comparatively recent origin and owes its establishment to the early efforts of Joseph Sexton, of Santa Barbara, and the late Felix Gillet, of Nevada City. The Santa Barbara Soft Shell seedlings and the several grafted varieties of this type all trace back more or less directly to the efforts of Sexton. The French varieties, such as the Mayette, Franquette, and the like, owe their popularity to the tireless work of the late Gillet in promoting the production of this type of walnut.

Commercial walnut-growing is largely centralized in the following counties mentioned in their order of importance: Orange, Los Angeles, Ventura, Santa Barbara, San Joaquin, and Contra Costa.

This industry is almost everywhere a specialized crop. It is seldom seen as one of two or more general farm crops, but, on the contrary, nuts are the one and only crop produced by many of the orchardists engaged in this industry. Success with this crop depends on the soil and climatic conditions and the availability of irrigation water. A deep rich alluvial loam containing plenty of humus is desirable. Groves planted on the light sandy loams or soils underlaid with a fluctuating water-table or a hardpan within 4 or 5 feet of surface are usually short-lived and unsatisfactory in the end. Although good drainage is imperative to a depth of at least 6 or 8 feet, irrigation water is necessary throughout most of the walnut areas of California for the best production of nuts.

The walnut industry has been most successful throughout the coast regions. In general, the high humidity and frequent fogs, together with a relatively small

daily range in temperature, seem favorable to this crop. Walnuts grown inland are subject to sun-scald injury on both the nuts and the trees. The inland regions are subject to a very low humidity, an extreme maximum temperature and a wide daily range. Some of the more recently introduced varieties seem to endure the inland conditions better than the Santa Barbara Soft Shell seedlings. It seems very likely that the inland valleys may yet be devoted to this crop with the proper choice of varieties.

Clean culture, with the use of a winter cover-crop, is

3988. *Wallichia disticha*.

the most prevalent type of soil-management practised by the progressive growers. Such cover-crops as melilotus clover, vetch, and rye are often seen. These crops are usually planted immediately after harvest, the latter part of September or October, and should be nearly waist-high at the time they are plowed under, in the latter part of March or April.

Irrigation water is applied by the furrow system in most cases, although occasionally a grove is watered by the basin method, where the land is level or where possibly a sod is grown in the grove throughout the year. From one to five or six applications of water are made in a season, depending on the moisture-holding capacity of the soil and local climatic conditions. Each irrigation should penetrate from 6 to 8 feet from the surface of the ground in order to reach the entire root-system. If the trees are irrigated a week or two before harvest, the shucks will open and remain on the trees, dropping the clean nuts to the ground. In case the trees are drought-stricken at harvest, the shucks are likely to become sunburned, stick to the nuts, and thus cause an increase in harvesting expense.

The larger number of growers do very little systematic pruning of the walnut except to remove the lower limbs which interfere with cultivation. Occasionally, however, a grove is to be seen in which the branches are annually thinned out. Such trees usually bear more nuts on the main limbs near their centers than the unpruned ones.

Companion crops in bearing groves are seldom seen, and in fact young groves, before they reach a bearing age, are sometimes handled with clean cultivation. The interplanting of young walnut groves with lima beans or other hoed vegetable crops, small-fruits, alfalfa, and occasionally apricots and peaches, is a common practice. Certain intercrops, as beans, if properly handled, will commence making returns immediately without detriment to the future walnut grove. Vegetable crops are preferable to tree crops for interplanting. Peaches and especially apricots have an apparent dwarfing effect on the young walnut trees. Their use may be profitable, however, in the end in spite of the injury caused.

The older plantings of walnuts were set too close together. Although 40 to 50 feet apart seemed ample room for development, it is very evident now that a distance of 60 feet is none too much for the larger-growing varieties on the rich loam soils which are best adapted to this crop. It is a matter of common observation to see the outside trees in a grove produce considerably more than the trees in the center. This leads one to believe that perhaps some of the older plantations might produce more walnuts today with fewer trees to the acre.

The older groves are composed entirely of seedlings, most of which are of the Santa Barbara Soft Shell type and trace directly or indirectly to the original trees grown by Sexton at Santa Barbara. It is only within a comparatively recent time, during the last ten to fifteen years, that the walnut has been propagated by budding and grafting in commercial quantities. During this time, a comparatively large number of varieties have been introduced and many of these have been discarded even thus early in the development of the industry. At the present time the following five varieties are being propagated to a greater extent than all other sorts combined: Placentia, Eureka, Franquette, El Monte, and Prolific. In general, the first two men-

tioned varieties compose nearly 70 per cent of the trees propagated at the present time in southern California nurseries.

The several black walnuts are used as rootstocks. The northern California species (*J. Hindsii*) is held in the greatest favor at present. This is a strong vigorous

3990. Black walnut.—*Juglans nigra*. On the right is the bare nut; on the left the husk not removed. ($\times \frac{1}{2}$)

tree which will withstand adverse soil conditions much better than the Persian walnut itself. Very few eastern black walnuts (*J. nigra*) are used for propagation, as they are usually thought to be less vigorous than California species. The southern California black walnut (*J. californica*) is little used at present, although it was once popular (Fig. 3992). This species starts growth so much earlier in the spring than the Persian walnut that it suckers profusely when used as a rootstock. It is not so rapid-growing as the *J. Hindsii*. Some of the nurserymen are using the Royal hybrid as rootstock. The Royal hybrid is the name commonly given to a cross between *J. nigra* and either of the California species. Some observers think the Royal hybrid root more resistant to excessive soil-moisture and general adverse soil conditions than any other rootstock. The Paradox hybrid, which is a cross between *J. regia* and any of the black species, is an exceedingly vigorous rapid-growing tree. This hybrid can be obtained by planting black walnuts which were produced in the neighborhood of *J. regia* trees. Such nuts will produce from 50 to 90 per cent hybrid progeny. Although this hybrid makes an excellent root and produces an exceptionally large and vigorous tree, it is rather impractical for general use as it cannot be obtained in wholesale quantities.

The nursery propagation of walnuts is usually by crown-grafting in place. The black walnut root is grown one year in the nursery and grafted the second spring just before the leaves start to come out. A short whip-graft is used, tied in place by soft cotton twine or raffia. After tying, the graft and top of the cion are covered thoroughly with hot wax. Some additional protection is usually given to prevent the cion drying out excessively. This is done by covering with a paper bag or by hilling the soil over the union until growth starts. The young trees are staked in the nursery, as they are very supple, due to their rapid growth. The one-year-old trees are preferred by most planters and should be 6 to 10 feet high at this age. As the trees are set in the orchard, they are usually cut back to about 5 feet. Some growers in the inland sections, however, prefer to cut the trees back to 18 inches and then train one sprout from the trunk of the tree. This sprout is pinched back when it reaches a height of 5 feet. The method necessitates staking the trees. At the end of one season's growth such severely headed-back trees may be as large as though they were left 5 feet high in the beginning. The trees cut back to 18 inches grow much more vigorously than trees only moderately pruned.

The harvesting of walnuts is done largely by Mexican families who camp in the groves through the picking-season. A portion of the nuts fall naturally to the

3989. *Juglans regia*, the walnut of commerce. Often known as "English walnut."

ground and the remainder are shaken off by means of hooks attached to long poles. The pickers receive from 80 cents to \$1 for 100 pounds for gathering the nuts and placing them in barley sacks. The nuts ripen through a period of a month or six weeks; therefore two or three pickings are made, followed by a gleaning of scattered nuts.

3991. *Juglans cinerea* of the eastern states. Sometimes known as white walnut. ($\times \frac{3}{8}$)

The nuts are washed, dried (Fig. 3993), culled, and sacked on the farm. They are then delivered to a central packing-house to be bleached. This is accomplished by spraying with electrolyzed salt-brine, or dipping in a solution of chloride of lime and sal soda, to which sulfuric acid is added. Either process removes all discoloration from the shells and gives them a bright light tan color, attractive in appearance. There are many ways of handling the nuts after bleaching to hasten their drying. Some packing-houses pass the nuts through a warm air-current in long drums, thence they are elevated to the bins, where they arrive nearly dry enough to sack. Other houses dry the nuts for about twenty-four hours in wire or lath bins. By putting each grower's nuts into several bins as the nuts come from the bleacher, and then drawing from several bins at the time the nuts are sacked, a thoroughly mixed uniform product is packed in each bag. Each bag contains 100 pounds of nuts.

The grading of California walnuts has developed rapidly within the last decade, as compared with sales in the past of seedling nuts ungraded and unbleached, as plain walnuts; the grading has gradually reached a stage where part of the nuts are sold under their variety name and another larger portion is disposed of after being bleached and strictly graded according to size, shape, color of the meat, and quality of same. The California Walnut - Growers' Association has recently introduced a one- and two-pound carton and has standardized the product handled in this package as strictly as breakfast foods and canned goods are graded and packed.

Although the walnut industry has not an established reputation for profitability which is comparable with citrus fruits of California, it has nevertheless maintained its position as a stable, conservative, permanent crop within this state. The income to the acre for this product will vary widely according to variety, soil, and climatic conditions as well as the personal element of management. Such incomes will fluctuate from \$100 to \$300 an acre. Whereas the average yield of walnuts for the state is between 800 and 1,000 pounds, the better groves will average from 1,500 to 2,000 pounds to the acre annually.

The future development of this industry seems to be drifting gradually inland, giving way in Orange and Los Angeles counties to citrus culture. The inland valleys were formerly thought to be poorly adapted to walnut-production because of the darkening of the meats by the intense hot sunshine; however, there are several sections which give promise for development along these

lines with the proper choice of varieties adapted to these particular environments.

The walnut industry enjoys one of the most notable features of any fruit industry of the country, inasmuch as its product may be successfully stored awaiting disposal for a period of at least twelve months if necessary. This has given the industry a very stable character and has freed this product from the speculative manipulations which are frequently found in connection with the perishable fruit products. It is interesting to note that the importations of walnuts into the United States have gradually increased during the last ten years and within this same period the total production and the prices to the growers of California have also gradually increased. This may be taken as only one of many indications that the walnut is being looked on more and more as a necessary food by the people of this country.

From present indications, this industry is less liable to the dangers of over-production than almost any other agricultural or horticultural crop within the borders of the state.

The chief insect and fungous troubles of the walnut are the walnut aphid, and also the walnut blight or bacteriosis (*Pseudomonas juglandis*). The aphid may be controlled by means of tobacco sprays; this is rarely done, however, as the damage is only occasional. There is no means of control known at present for the blight or bacteriosis (Fig. 3995). The wide variation among seedling trees in their susceptibility to the disease gives promise of eventual relief through the selection of blight-resistant varieties. Minor losses are due to red-spider, codlin-moth, and melaxuma.

Commercial possibilities of walnuts other than Persian in the United States.

Theoretically, the commercial possibilities of a number of walnut species in this country are large and encouraging. The genus *Juglans*, to which all true walnuts belong, either as native or as planted trees, covers practically every cultivated section of the United States wherever suited to hardwood growth. Apparently some of its representatives may be taken to many new small localities where it is now not found. The nuts of practically all species possess kernels rich in food properties and exceedingly pleasing to the taste. Most of its species are fairly rapid growers and develop into shapely trees. Rightly chosen and well cared for, they may be used most effectively as ornamentals and as nut-producers at the same time. The eastern black walnut, *Juglans nigra*, is exceedingly valuable for timber purposes, and its planting is now strongly urged by the foresters; to a large extent the various native walnuts and their hybrids make the best stocks now available for the Persian walnut.

Practically, there is little doubt but that each of these species will ultimately be developed for purposes of nut production, although in common with most new industries the progress will be slow and beset with more or less disappointment. It should be borne in mind that these walnuts are wild and uncultivated species and cannot be expected to respond to cultivation with the same readiness as species which have been selected and cultivated for centuries.

The principal problem now before the prospective planter appears to be one of varieties. It is well established that seedlings vary greatly in all essential characteristics and, therefore, are less desirable than are budded or grafted trees of suitable varieties. However, to date, there are fewer than a half-dozen varieties of black walnuts offered by the nurserymen, and so far as generally known, there is none of butternuts or other kinds of walnuts, exclusive of Persian. Therefore, for the present, planters must depend very largely on seedling trees, for which, although they are generally condemned by the leading horti-

culturists, there are at least four substantial reasons for using, as follows: (1) Budded and grafted trees are as yet offered by the nurserymen only to a very limited extent; (2) the available varieties are new and practically untried; (3) the prices necessarily asked by the nurserymen are beyond the reach of many who would otherwise plant walnut trees; (4) desirable varieties are liable to result from the planting of nuts from choice trees.

Definite steps are now being taken toward the development of these species and already some distinct progress has been made; but as yet it is very doubtful whether commercial planting of trees of any species of *Juglans*, other than *J. regia*, for purposes of nut production alone, is to be recommended. In general, it is unwise to attempt the growing of trees for the dual-purpose of timber and nut production, as for the former, the trees should be set close together in order to induce the development of long trunks with a minimum of top, while for the latter purpose, they should be given orchard space between in order to allow for the development of low heads, large tops, and a maximum fruiting surface. But in view of the uncertainty of outcome with any of the present available varieties and the value of black walnut timber, it is possible that trees of this species might wisely be planted at one-half or one-quarter the usual orchard distances apart, with the idea of allowing them to become forest trees, if for any reason the nuts should not justify their retention for orchard purposes. It is very doubtful whether any other species of walnut could be recommended for such use, as with the possible exception of the two forms of hybrids common in California, Paradox and Royal, no other species of walnut is now being seriously considered for forest-planting and, except in rare instances, neither of these Californian forms produces nuts of value in commercial quantities.

Without doubt, the most promising place for walnut planting at the present time is about the home grounds, both in the city and in the country, and along the fence-rows everywhere. Very often walnuts yielding both beauty and product could as well be planted as trees of other species capable of affording beauty and shade only. In the country, few grounds are so crowded that there is not room for a few walnut trees, which could be procured at small initial cost and which could be developed into useful trees at practically no further expense. If one-quarter of the American farmers were to plant even two walnut trees about their premises, it is difficult to estimate what would be the aggregate increased value to such farms by the end of a

3994. Walnut orchard in southern California.

quarter-century, but certainly it would be very appreciable.

Among the species of walnuts not usually under cultivation, but which give promise of commercial possibilities, some are discussed in the following:

The American black walnut, Juglans nigra.

As a producer of marketable nuts, this species now gives greater promise than does any other secondary species of *Juglans*. Its natural range extends from middle New England to north Florida, in the east, and from Minnesota to Texas on the west. Although best suited to deep fertile loams, moist yet well drained, it readily adapts itself to conditions less favorable. It attains its best development in the basin drained by the Ohio River but is common at practically all altitudes in the eastern states up to about 1,400 feet where it is superseded by the butternut. The tree is a symmetrical and fairly rapid grower; usually moderately productive and very useful both in the landscape and as a forest tree. The nuts usually are thick-shelled, and it is seldom that the kernels can be separated from the cracked shell in perfect halves. A few varieties, the kernels of which crack out more or less perfectly, are now listed by the nurserymen. The two best known are the Thomas, introduced from Pennsylvania in the early eighties, and the Stabler from Maryland in 1915.

The butternut, white or long walnut, J. cinerea.

In many respects, this species is similar to the preceding. Its northern range is somewhat more extensive than is that of the black walnut and its southern and western limits are less by about 300 miles. The tree is shorter-lived, not as symmetrical in form, nor as capable of adapting itself to unfavorable conditions, and the timber is of inferior value to that of black walnut. The nuts have thicker and rougher shells and are more difficult to crack but the kernels are more readily separated from the broken shells in perfect halves than are those of the former species. By many, the kernels of the butternut are much preferred to those of any other nut.

The Japanese walnut, J. Sieboldiana.

This species and its variety *cordiformis*, described in Vol. III, page 1723, as there explained do not breed true to type but revert to each other or to intermediate forms, and not infrequently to a type, the nuts of which are often practically indistinguishable from those of the butternut. These forms are now fairly common throughout much of the eastern and southern United States. The trees are dwarfish in habit, broadly spreading, ornamental, precocious, and usually prolific. A few varieties have been recognized and propagated to a limited extent, but so far as can be ascertained, none is

now listed by the nurserymen. However, enough good strains may now be selected to cover practically every section of the United States, with the possible exception of the dry Southwest. The nuts vary in size and form, but typically are broadly rounded at the base, conical, and smaller than are those of *J. nigra*. When struck with a hammer, they tend to open at the suture, thereby breaking both half-kernels into quarters. Frequently, nuts of the cordiformis type open automatically at the apex, and with the aid of a knife-blade, the half-shells may be separated entirely and the whole kernel removed without breaking. In color, texture, and flavor of kernel, the Japanese walnuts are very similar to those of the butternut, *J. cinerea*.

Miscellaneous species of Juglans.

A species from northeastern China (*J. mandshurica*), the nuts of which are intermediate in form between those of *J. cinerea* and *J. Sieboldiana*, was introduced into the United States some years ago but is not yet sufficiently well tested to make possible a definite report. It should be hardy and therefore of value in the northern states. Aside from those already included, there are a number of species of *Juglans* which are more or less common in parts of the United States, but all are of minor importance, so far as nut production is concerned, and apparently of use only in sections where the better species are unadapted and as stocks for superior varieties. Among such are included *J. californica*, *J. Hindsii*, *J. major*, and *J. rupestris*. For full accounts of these species, see Vol. III, pages 1721 to 1724.

Juglans hybrids.

The various walnut species so freely interpollinate, when grown in close proximity to each other, that when pure strains are desired it is not safe to plant the nuts where there is danger of such pollination having taken place. The familiar Paradox and Royal of California, crosses of *J. regia* with any species of black, and of any California black with the eastern black, respectively, are typical examples of such natural hybridity. In the East, there are num-

erous crosses of *J. regia* with other species, viz., *J. intermedia* (*J. regia* × *J. nigra*); *J. quadrangulata* (*J. regia* × *J. cinerea*); and one between *J. regia* and *J. Sieboldiana*, which apparently has not yet been described. Frequently, individual trees of these forms are sturdy growers and make valuable stocks for other species, as already noted, but usually they are practically nonproductive and of little value to the orchardist.

C. A. REED.

WANDERING JEW: *Zebrina pendula* and *Tradescantia fluminensis*. The common purple-leaved wandering jew of greenhouses, with pink flowers that open in sunshine, is *Zebrina pendula*, often confused with *Tradescantia*.

3995. Blight or bacteriosis of the walnut, as shown on fruits and leaves.

WARDIAN CASE. A nearly air-tight case with glass sides and top, used for transporting growing plants on long sea voyages, invented about 1836 by N. B. Ward, who wrote a book of ninety-five pages "On the Growth of Plants in Closely Glazed Cases," published at London in 1842. It provides the best and safest method of transporting potted and living plants across the ocean, as it insures the necessary light, protects the plants from salt spray and foul gases, and requires a minimum of care, as the plants need no watering. Such cases maintain nearly uniform conditions of temperature, moisture, and atmosphere. Similar cases are used in greenhouses for growing filmy ferns, dwarf foliage plants, and other small specimens that require a very moist and close atmosphere and invariable conditions.

WARPÛRIA (named after G. Warpur, who collected the genus). *Acanthaceæ*. Low perennial greenhouse herb, branching from the base: lvs. opposite, approximate, entire or nearly so; fls. minute, white, in dense many-fl. cymes, head-like, long-peduncled, collected in the axils; calyx hyaline, 5-parted, segms. narrow, posterior 3 distinct nearly to their base, anterior 2 con-

3996. *Warscewiczella discolor*. ($\times \frac{1}{4}$)

nate to their middle; corolla-tube rather cylindrical, limb minute, lobes 5, rotundate; stamens 4; disk annular; ovary 2-celled, cells 2-ovuled; caps. oblong, the upper third contracted into a beak.—One species, Madagascar.

clandestina, Stapf. Plant about 4–5 in. high, pilose: st. short, prostrate or ascending: lvs. petioled, oblong or oblong-lanceolate, $2\frac{1}{2}$ –3 $\times$ $\frac{3}{4}$ –1 $\frac{1}{4}$ in., acute or subacute at both ends; peduncles declinate, densely canescent; head $\frac{1}{2}$ –1 in. diam., white-pilose; calyx-segms. triangular-subulate from the base; corolla white, limb minute. Madagascar.

WÁRREA (named for Frederick Warre, who discovered the first species in Brazil). *Orchidaceæ*. Plants with the habit of small forms of Phaius. Lvs. few, long, plicate; scape tall, bracted, bearing a raceme of terminal showy fls.: sepals and petals subequal, concave, the

lateral sepals united with the base of the column; labellum not spurred, united with the base of the column, undivided, concave, with longitudinal ridges; column without appendages; pollinia 4, with a narrow stipe.—Two species, Peru and Colombia. They require the same treatment as phaius.

bidentata, Lindl. (*W. Lindeniana*, Henfr.). Labellum regular, slit at the end; ridges convex, the central ones thinner and deeper; bracts one-fourth as long as the pedicels. Sept. Venezuela and Colombia. A.F. 6:655.

W. cyanea, Lindl. = *Aganisia cyanea*.

HEINRICH HASSELBRING.

WARSCEWICZÉLLA (from J. von Warscewicz, a Pole, collected in S. Amer. for Van Houtte; died 1866 in Cracow). *Orchidaceæ*. Orchids suitable for a cool-house. Fls. solitary, large, on a peduncle; sepals and petals similar, the lateral sepals forming a chin; lip jointed to the foot of the column, 2–5-lobed, with erect side lobes; and a transverse plate free from but lying upon the middle lobe; pollina 4.—About 10 species, from Costa Rica to Colombia and Peru. By some included in *Zygopetalum*.

discolor, Reichb. f. (*Wárra discolor*, Lindl. *Zygopetalum discolor*, Reichb. f.). Fig. 3996. Lvs. narrowly lanceolate, jointed, 9 in. long; scapes 1-fl., shorter than the lvs.: sepals spreading, lanceolate, white; petals shorter, ovate, white with a tinge of purple, half-spreading; labellum large, broadly obovate, somewhat convolute, white, changing to deep purple toward the disk, and having a whitish or yellowish crest. Cent. Amer. B.M. 4830.

Wéndlandii, Hort. (*Zygopetalum Wéndlandii*, Reichb. f.). Lvs. tufted, lanceolate: fls. 4–5 in. across, solitary, on a scape 3–4 in. long; sepals and petals lanceolate, somewhat twisted, greenish white; labellum ovate, cordate, undulate, white, streaked and spotted with violet-purple; apex revolute, crest semi-circular, violet-purple.

W. aromática is offered by Lager & Hurrell. Apparently little known. Described as having white fls., with an azure lip, white-bordered. Said to come from Costa Rica.

GEORGE V. NASH.

WASHINGTONIA (named for George Washington). *Palmaceæ*, tribe *Corypheæ*. Tall North American palms, making noble specimens for planting in California and similar regions.

Trunks clothed above with remains of the sheaths and petioles: lvs. terminal, ample, spreading, orbicular, flabellately plicate, lobed nearly to the middle; segms. induplicate, filamentous on the margins; rachis short; ligule large, appressed; petiole long, stout, plano-convex, very spiny along the edges; spadices long, copiously paniculately branched, glabrous: branches slender, flexuous; spathes long membranous, split, glabrous: fls. white; fr. small, ellipsoid, black drupe, with a thin and sweetish rather dry pulp; seed brown, oblong to oblong-ovate, flattened, excavated or wrinkled on the raphe face.—Species 3, now recognized, Ariz., S. Calif., and Mex.

Probably the oldest use of the generic name *Washingtonia* is by Rafinesque in 1818 for the umbelliferous plants commonly known as *Osmorrhiza*; it was also once proposed for the *Sequoias*; and the name *Neowashingtonia* has been advanced for these palms. However, the use of *Washingtonia* for the palm is too well established to warrant the change. Parish, who has recently studied these palms, retains the name *Washingtonia* as the only tenable one, discarding the name *Washingtonia* when applied to the *sequoias* and also when used for the *osmorrhizas* on what he considers to be sound nomenclatorial grounds (Bot. Gaz. 44, pp. 408–434, 1907). His systematic treatment of the genus is followed in the present account.

The *washingtonia* that is best known in the wild is *W. filifera* var. *robusta*. The finest grove occupies the narrow palm cañon for a mile or more, 22 miles east of

CXVIII. *Washingtonia filifera* var. *robusta*.

Banning, Riverside County, California. This is the largest group of indigenous fan palms in the United States, and the only grove of important size on the Pacific side of the United States. The grove contains thousands of trees, some of them nearly 100 feet high. There are many young ones of all sizes and the older trees are still vigorous. Most of the cañons of the desert bases of San Jacinto, according to Parish, contain these palms; and a few grow in the cañon of the White Water River, which is the western limit of the species. The southern limit is probably Carrizo Creek, San Diego County, and the northern at Corn Springs in San Bernardino County. Except in trees protected in cultivation, old specimens are rarely seen bearing the great shaggy mass of dead hanging leaves, for they are burned off by Indians or take fire by accident; even in cultivated trees, the mane is usually cut away to give the plants a neater appearance but much of the characteristic beauty of the palm is then lost. Parish writes that "the functional life of a leaf is about one year. How long the dead leaves would remain attached to the trunk if undisturbed cannot be stated; probably for a very long period."

The washingtonias are much planted in California, thriving even in the climate about San Francisco Bay. In southern California they attain great size and comprise a characteristic feature of the landscape. They grow readily from seeds, but the trunks rise slowly. Two species are commonly planted, *W. filifera* var. *robusta*, with leaves bearing many filaments or threads on the edges and in the sinuses, and *W. gracilis* which is practically devoid of filaments.

- A. Petiole prolonged into the blade with an acuminate point.
 B. Blade of lf. abundantly supplied with threads or filaments..... *filifera*
 BB. Blade nearly or quite destitute of filaments or threads..... *gracilis*
 AA. Petiole obtuse at its top where it joins the blade..... *Sonora*

filifera, Wendl. (*Brâhea filamentosa*, Hort. *B. filifera*, Hort. *Pritchardia filamentosa*, Wendl. *P. filifera*, Hort.). Margins of the petioles armed up to the middle or somewhat beyond with stout hooked spines, but naked above: st. cylindrical, 20–40 ft., enlarged at the base (2–3 ft.), covered with persistent petiole-bases: petioles 2–5 ft. long, 1–2½ in. wide at the summit, glabrous, plano-convex; ligule large, glabrous, lacerate; blade circular, tomentose on the margins of the many segms., 3–5 ft. diam., cleft on the upper side nearly to the middle, gray-green; segms. margined with numerous fibers 6–12 in. long; seed flattened on the raphal face. Probably S. Calif. and W. Ariz.—Cult. on the Riviera, S. France, but not distinguished in this country.

Var. *robusta*, Parish (*W. robusta*, Wendl. *W. filifera*, Hort., not Wendl. *Neowashingtonia filamentosa*, Sudw.). Fig: 3997. The palm usually cult. in this country as *W. filifera*, whereas the one cult. as *W. robusta* is really *W. gracilis*: margins of petiole armed throughout: trunk stout, enlarged at base, 60–90 ft. tall: petioles stout and erect until old, 3–5 ft. long, the upper surface concave; ligule paper-like, acuminate and torn; lf.-blade 3–5 ft. across, with 60–70 folds, cleft two-thirds to the base, the margins with abundant threads: panicle declined, exceeding the lvs., the infl. dense, but in fr. becoming diffuse or open: fls. with heavy odor: seed excavated on raphal face. Borders of the Colorado Desert in S. Calif., at low altitudes.—The commonly planted Washingtonia in Calif. with filiferous lvs. The portraits in horticultural magazines are mostly not clearly referable.

Var. *microspërma*, Becc. Cult. in the Riviera but yet undiscovered in the wild, differing in smaller stature, and

margins of petioles armed only at base: seed flattened on raphal face.

gracilis, Parish (*W. robusta*, Hort., not Wendl.). A slender-trunked palm, to 80 ft. or so, the lvs. nearly or quite destitute of filaments: petioles 2–3 ft. long, rather convex on upper surface, the hard margins armed with short yellow hooked spines for the entire length, the top acuminate where it joins the blade; ligule paper-like, narrow, entire; lf.-blade about 3 ft. diam., with 75–80 folds, cleft little more than one-third toward base: peduncle declined, exceeding the lvs.: fls. nearly sessile: seed broad-ovate, about ¼ in. long, somewhat rugose or wrinkled on the raphal face. Probably native in northern Low. Calif.—From the *W. filifera* group this tree is distinguished by its slender trunk, smaller and less deeply divided shorter-stalked lvs. which bear no filaments or threads except now and then one in the sinuses of some of the folds.

3997. Old tree of *Washingtonia filifera* var. *robusta*.

Sonora, Wats. (*Neowashingtonia Sonora*, Rose). Top of petiole obtuse where it joins the blade, the latter abundantly supplied with filaments: st. 25 ft. high, 1 ft. diam.: lvs. 3–4 ft. diam., somewhat glaucous, very filiferous; petioles 3 ft. long, very slender, 2 in. wide at base, ¾ in. at apex, floccose-hairy along the margins and with stout curved spines: fr. ¼ in. long, edible. Guyamas and Low. Calif., Mex.—Yet imperfectly known in cult.

WATER-GARDENING: *Planting*, Vol. V, p. 2668.

WATERING. The watering of plants usually exhibits the skill, or the lack of it, of the gardener. It is a practice that cannot be well explained in print, although a few general statements may be made.

An abundant and convenient supply of pure fresh water should always be a first consideration in locating a garden or greenhouse. Having this, the next matter is knowing how to use it, for here, good gardeners say, lies nine-tenths of the elements of success. Certain it is, especially in the indoor cultivation of plants, that more depends on knowing when to give or withhold water than on any other single matter. The art of watering is unteachable; it requires experience, judgment, skill. Some knowledge of the commoner facts of vegetable physiology, physics, and soil physics will be helpful, but even then experience will be necessary.

In American gardens watering is usually performed with a hose from a stored water-supply. Two common types of watering-cans are shown in Fig. 3998.

A fairly safe guide to watering is: never water plants until the soil has become dry, though not "powder-dry," and then give them a thorough soaking. Plants dislike a continuously wet soil. In the care of plants in earthenware vessels, a useful test is to thump the jar. If it rings the soil is dry; if the sound produced is dull the soil is sufficiently moist. Such rules, however, are only for the novice. They presuppose activity of growth, and take into account only one consideration aside from this, and that is the condition of the soil as regards moisture. The experienced gardener reads his practice in his plants and the conditions under which they are being kept. The following suggestions are based on the most important considerations.

Actively growing plants may be watered very freely, as a rule, whereas in a dormant or semi-dormant state the same plants will require only occasional waterings. Soft-stemmed or rapid-growing plants ("soft-wood" and "herb-like" plants), and those with large leaves, need, as a rule, an abundance of water when growing actively. Hard-wood or slower-growing plants, with smaller leaves, must be watered with greater care. Soft-wooded plants, with some exceptions, may at times even flag somewhat for want of water, and recover without permanent injury when a fresh supply is given. Hard-wooded plants, as camellias, azaleas, and heaths, on the other hand, suffer permanent injury from becoming too dry. It is safest to allow no plant in active growth to flag.

The amount of foliage affects the plant's capacity for using water. Plants which have been cut back, or which from disease, insects, or other causes, have lost most of their foliage, must be kept drier until they have regained their foliage. Unhealthy plants are benefited, as a rule, by being kept rather dry until they begin to show signs of renewed vigor.

Small cuttings, or any plants freshly potted or newly transplanted, are not in condition to use much water until the root-hairs have attached themselves to the soil-particles and growth has begun. A thorough watering at the time of potting or repotting the plants, especially if they are subsequently shaded for a few days, is usually sufficient until they have become established.

The character and bulk of soil should be kept in mind. Porous and warm soils dry out much sooner, while the heavier clay soils are in danger of becoming water-logged and sour unless watered with care. When there is a large mass of soil in proportion to root-development, as in the case of greenhouse beds newly set with young plants, care must be used in watering until the soil is occupied with roots.

Serious trouble often begins in the greenhouse from a heavy watering at the beginning of a period of dark muggy weather. Not only does such watering do damage to the soil and roots, but the excessive humidity of the air about the plants and its weakening effect on their tissues invite the attacks of various mildews, fungi, and insect pests.

The time of day is important. In the greenhouse in winter free ventilation is usually impossible. At night there is a tendency toward a damp atmosphere. Careful florists, therefore, water in the early part of the day at this season, so that the house will have become somewhat dried out by nightfall. It is seldom advisable to let plants under glass go into the night with wet foliage. It gives the fungi a chance. Especially hazardous is it to water cutting benches or boxes of young seedlings late in the day in the winter season. The various damping-off fungi find under such treatment the condition suitable for their development. Excessive humidity on the interior of a closed plant-house is most likely to occur in moderate weather. During severe weather the condensation upon the glass is large and renders the air of

3998. Watering-cans, capacity 3 to 4 gallons. Used chiefly for sprinkling seed-beds or newly potted small seedlings and cuttings; for use on older plants the "rose" is commonly removed. The can on the left, flattened on the sides, is generally preferable. It can be carried in greenhouse walks and in narrow rows. The long spout enables the operator to apply the water directly to the roots; and the greater force of the discharging water makes a better spray from the "rose."

the house drier. During summer, when there is free ventilation, the watering may advantageously be done late in the day. Midday watering at seasons when the sunshine is very bright is often followed by scalding of the foliage unless the plants are well shaded. Ferns, Rex begonias, Chinese primroses and richardias are among plants easily injured in this way.

Consider the temperature at which the plants are kept, the position of the heating-pipes, the amount of light, and the freedom of ventilation permissible in watering plants in glasshouses. It is better, as a rule, to have the watering conform to these conditions; but frequently the practice must be reversed.

The temperature of the water exerts a marked effect on the growth, flowering, and fruiting of plants. It is now held that, in general, the water should be of a temperature close to that of the air in the house where the plants are growing, or about 10° F. below.

Watering may be indirect. Shading the glass of greenhouses in summer with some suitable material is much practised by florists for the purpose of sheltering plants from too great intensity of light, and for the purpose of reducing evaporation and transpiration. Certain kinds of plants, as palms, and some kinds of ferns, require this; also newly potted plants. Syringing of walks, by reducing the temperature and increasing the humidity of the air, also tends to reduce transpiration and save watering. Watchfulness and attention to ventilation are necessary, however, to avoid excess.

sive humidity, which tends toward a soft watery growth and extreme sensitiveness and susceptibility to disease.

Vessels to contain plants should always be provided with openings at the bottom for perfect drainage. This, in a measure, is a safeguard against overwatering. Investigation has shown that a soil which is kept continuously wet through bad drainage or otherwise is rapidly impoverished through loss of nitrogen. A fermentation is also set up in the roots, which, through the formation of various deleterious products, results in their destruction.

While a constantly wet soil is always very objectionable, thoroughness in watering as often as the plants need water is of the greatest importance. When enough water has been supplied there will be more or less dripping from the bottom of the pot. It is a good plan to leave a space of $1\frac{1}{2}$ to 2 inches or more at the top of the pot, according to its size, for the reception of water. This space should be so large that when filled the supply of water in soaking downward will penetrate to the bottom of the vessel.

Plunging the pots or tubs is a means of controlling the water-supply. The late William Scott gives the following advice on this practice: While it is true that most of the water given to the plant passes through the soil and escapes from the hole in the bottom of the pot, yet much that is left in the soil—which is considerable if the soil is saturated as it should be—is evaporated from the porous sides of the earthenware pots. In warm sunny weather, plants in small pots, standing on a bench, dry out very quickly. This can be avoided by plunging the pots in some material, as coal-ashes, tan-bark, or, better than all, spent hops. When plunged to the rims, only half of the surface-watering is needed, and the advantage of less watering is shown by a marked improvement in the health and vigor of the plants. Such a benefit is this plunging that plants which would otherwise need a shift into a size larger pot can be carried along another month in perfect health. This applies more particularly to quick-growing soft-wooded plants, geraniums more especially, for these are quickly exhausted by too frequent waterings.

In watering beds in the open ground and lawns, the chief consideration is thoroughness. Superficial waterings induce the formation of roots near the surface. Neglect and subsequent drought then prove more disastrous than ever. The evening is the best time for surface sprinkling. Watered in the heat of the day, grass and various other plants are likely to have the foliage injured. Ordinarily it is better to avoid watering beds of plants in the open ground if possible or delay it until really necessary, and then water thoroughly. Other references to watering may be found in the article "Greenhouse Management," beginning on page 1408, Vol. III; see also "Sub-irrigation in the Greenhouse," page 1684.

ERNEST WALKER.

WATERMELON: *Melon*, Vol. IV, page 2031.

WATSONIA (named for Sir Wm. Watson, M.D., 1715–1787, electrician and professor of botany at Chelsea). *Iridaceae*. Tunicate bulbous herbs, much like gladiolus, used in the garden for summer bloom.

Stems usually tall: lvs. long, sword-shaped: spikes long, simple or slightly branched; spathe lanceolate oblong or narrow, usually numerous; fls. 1 to a spathe, sessile; perianth-tube curved, broadened above, lobes subequal, ovate, oblong or lanceolate; stamens affixed within the throat; ovary 3-celled, cells many-ovuled: caps. globose, ovoid or short-oblong, loculicidally 3-valved.—About 33 species, S. Afr. The main differences between *Watsonia* and *Gladiolus*, from the horticultural as well as botanical points of view, are the longer tube and regular fl. of *Watsonia*, 3 of the 6 perianth-segms. in *Gladiolus* being usually different in size, shape, and direction of spread. An important

botanical difference is that the style-branches of *Watsonia* are simple, while those of *Gladiolus* are bifid.

Watsonias bloom from July to September and have scarlet, rose, or white six-lobed flowers, with usually a long slender tube which is bent near the base. They are very much like gladioli, having the same kind of a corm, the same sword-shaped rigid leaves, the same kind of a spike and the same season of bloom. It is, therefore, a great mistake to suppose that they are suited only to greenhouse cultivation. Great interest has been aroused in *watsonias* by the introduction of the white *watsonia*, known to the trade as *W. Ardernei*. The plant might be roughly described as a white gladiolus. It grows 3 to 4 feet high, strong specimens being branched, and bears a dozen or more flowers, each $2\frac{1}{2}$ to 3 inches long and about 3 inches across. The purity of its color and its value for cutting make it of exceptional interest to florists. There are other white-flowered forms of *watsonia*, but none of them seems to be in the American trade. Pure white is the exception in the iris family, while it is a common, if not dominant, "color" in the lily and amaryllis families. The white *watsonia* has acquired so many names that a short historical sketch of the plant is desirable. All the stock in the trade at present is supposed to be descended from plants cultivated by H. W. Arderne, of Cape Town. The original bulb was found 80 miles away in a peat-bog amongst thousands of the common pink-flowered kind. In October, 1892, Arderne had 400 spikes in bloom and in March, 1893, some of his plants were pictured in "The Garden" under the name of *Watsonia alba*. However, a pure white-flowered form had been previously found near Port Elizabeth and a bulb sent to J. O'Brien, of Harrow, flowered in England in 1889 and was then fully described as *W. iridifolia* var. *O'Brienii*, the name adopted in this work. In the recent discussions of the plant, the fact has been overlooked that T. S. Ware, of Tottenham, cultivated a white variety in 1880, it being figured in "The Garden" for that year as *Watsonia alba*. A nearly white form was cultivated in England as early as 1801, but the tube was pinkish outside and there was a rosy spot at the base of each perianth-segment. William Watson, of Kew, was the first to emphasize the close horticultural parallel between *Watsonia* and *Gladiolus* and to urge the whole group on the attention of the plant-breeder. This suggestion, coming from the man who may be said to have created the modern Cape primrose or streptocarpus, should result in another fine race of hybrids before many years. However, the *Watsonia* "bulb" is not so easily and safely stored as that of *Gladiolus*.

A. Upper part of tube cylindrical or narrowly funnel-shaped.

B. Length of perianth-segms. $\frac{1}{8}$ – $\frac{1}{2}$ in.

aletroides, Ker-Gawl. Bright scarlet or pale pink-fl. species, 1–2 ft. high, remarkable for the short perianth-segms.: st. simple or branched: spikes 6–12-fl. B.M. 533 (rosy scarlet, splashed with cardinal, the inner segms. white at the tip).

BB. Length of perianth-segms. $\frac{3}{4}$ –1 in.

c. Sts. tall, 3–4 ft., often branched.

D. Spikes lax, 12–20-fl.

E. Fls. scarlet.

angusta, Ker-Gawl. (*W. iridifolia* var. *fulgens*, Ker-Gawl.). Scarlet-fl. species distinguished from *W. Meriana* by the color of the fls. and by the shape of the perianth-segms. In *W. angusta* the segms. are decidedly acuminate, while those of *W. Meriana* are more nearly oblong and come to a point suddenly; also the style of *W. angusta* reaches to the tip of the perianth-segms., while in *W. Meriana* it does not. B.M. 600. Gn. 17:390 (as *W. Meriana* var. *coccinea*); 44:164. Gn.W. 21:683.

EE. Fls. rose-red or white.

F. Lvs. $\frac{1}{2}$ – $\frac{3}{4}$ in. wide: spikes about 12-fld.

Meriàna, Mill. This seems to be the dominant species of the genus and hence the most variable and the one most interesting to the plant-breeder. In its widest sense it includes *W. iridifolia*, but for horticultural purposes it will be convenient to consider the latter a distinct species. *W. Meriàna* is best restricted to the commonest type at the Cape, which is a rose-fld. species 3–4 ft. high, the st. usually branched, lvs. $\frac{1}{2}$ – $\frac{3}{4}$ in. wide, and the spikes 12–20-fld. This is the plant figured in B.M. 418 as *Antholyza Meriàna*. Gn. 17:390 is more typical in color. The white-fld. form, which is rarer in nature, is treated under *W. iridifolia*. Baker says that there are scarlet-fld. forms of this species, but he gives them no name, and it is probable that all such should be referred to *W. angusta*.

FF. Lvs. wider: spikes denser, 20-fld. or more.

iridifolia, Ker-Gawl. (*W. Meriàna* var. *iridifolia*, Baker). This is treated by Baker as a variety of *W. Meriàna* characterized by broader lvs. than the type: fls. closer and more numerous, white or pinkish. For horticultural purposes it will be convenient to treat it as a distinct species and restrict the name to the pink or rose-colored type.

Var. **O'Brienii**, N. E. Br. (*W. alba*, Hort. *W. O'Brienii*, Mast. *W. iridifolia* var. *alba*, Wm. Robinson. *W. Ardernei*, Hort. *W. Ardernei* var. *alba*, Hort. *W. Meriàna* var. *alba*, Hort. *W. Meriàna* var. *Ardernei*, Hort.). **WHITE WATSONIA**. A variety with pure white fls., discussed on page 3509. Gn. 17:390; 43, p. 229; 51, p. 284; 61, p. 89; 72, p. 17. J.H. III. 29: 219. G.C. III. 11:305; 19:143; 52:129. A.G. 20:573. G. 26:235; 37:285. R.B. 27, p. 33. G.M. 49:477. G.L. 27:180. R.H. 1910, pp. 504, 505.

DD. Spikes dense, 30–50-fld.

densiflora, Baker. This very distinct and handsome rose-colored species more nearly resembles a gladiolus than any other by reason of the density and regularity of its pyramidal infl.: sts. unbranched, 2–3 ft. high: spikes a foot long: fls. bright rosy red. B.M. 6400.—There is a choice variety with pure white fls. Var. **álba**, Hort., was intro. as early as 1891.

cc. Sts. shorter, mostly 1–2 ft., unbranched.

D. Tube $1\frac{1}{2}$ –2 in. long.

coccinea, Herb. This showy scarlet-fld. species differs from *W. Meriàna* in its st. being shorter and unbranched, the spikes fewer-fld., and the styles a trifle longer: st. 1 ft. high: spikes 4–6-fld.: corolla-tube elongated, longer than the limb, the lobes spreading, oblong, acutish. B.M. 1194 (*W. Meriàna* variety). J.H. III. 53:61.

DD. Tube $1\frac{1}{2}$ –2 in. long.

hùmilis, Mill. This species has rose-red fls. apparently the same size and color as *W. densiflora* but only 4–6 in a spike and the st. only a foot or so high: corolla-lobes oblong-lanceolate, acutish. B.M. 631.—A variegated form figured in B.M. 1193 as *W. roseo-alba* has a spike of 8 flesh-colored fls. with broad bands and splashes of scarlet.

AA. Upper part of tube short and broadly funnel-shaped.

rosea, Ker. Robust rose-colored species, growing 4–6 ft. high and the fls., though fewer than those of *W. densiflora*, are perhaps capable of greater size: spikes about 15-fld.: lvs. lorate-lanceolate: corolla-limb nodding, subcampanulate. B.M. 1072. G. 26:445. Gn. 77, p. 484. J.H. III. 44:162.

WILHELM MILLER.

F. TRACY HUBBARD.†

WATTLE: *Acacia*.

WAXBERRY: *Symphoricarpos*. **W. Myrtle**: *Myrica cerifera*. **W.-Palm**: *Cerozylon* and *Diplothemium*. **W.-Plant**: *Hoya carnosa*. **W.-work**: *Celastrus scandens*.

WEDELIA (Georg Wolfgang Wedel, professor at Jena, Germany, 1645–1721). *Compositæ*. Scabrous-pubescent or hirsute, annual or perennial herbs or subshrubs, suitable for growing in the greenhouse: lvs. opposite, usually dentate, rarely 3-cleft or entire: head heterogamous; ray-fls. male, disk-fls. fertile or the innermost sterile; involucre ovoid, campanulate or somewhat hemispherical, bracts in 2 rows; corolla yellow, male ligulate, spreading, apex entire or 2–3-toothed, female regular, tubular, 5-toothed or shortly 5-cleft: achenes glabrous or pilose, smooth or tuberculate, cuneate-oblong or obovate.—About 70 species, natives of the warmer regions of the world.

oblōnga, Hutchins. Glandular-hairy herb, up to nearly 3 ft. high: lvs. oblong or oblong-lanceolate, acute, $3-3\frac{1}{2} \times \frac{3}{4}-1$ in.: peduncles $1\frac{1}{2}-2$ in. long: fls. heads lemon-yellow, $1\frac{1}{2}-2$ in. diam.; outer bracts leaf-like, inner somewhat scarious; ray-florets about 12, 3-toothed. British E. Afr.

To this genus, *Pascalia* is referred by recent authors. *P. glauca*, Orteg., is from Chile, probably not in cult. The plant cult. under this name in England, and once offered in this country, is probably the plant shown in P.M. 8:125, which is thought to be a *Helianthus*. It is not hardy and there seems to be little reason for cultivating it here where there are so many hardy sunflowers. *P. glauca* is an herbaceous perennial, with opposite linear-lanceolate lvs., the upper ones entire and lower ones irregularly dentate: heads terminal and solitary, yellow-rayed.

WEEDS. A weed is a plant that is not wanted. There are, therefore, no species of weeds, for a plant that is a weed in one place may not be in another. There are, of course, species that are habitual weeds; but in their wild state, where they do not intrude on cultivated areas, they can scarcely be called weeds. The common pigweed and the purslane are sometimes vegetables, in which case potato plants would be weeds if they grew among them.

It would have been a sorry thing for agriculture if there had been no weeds. They have made us stir the soil, and stirring the soil is the foundation of good farming. Even after we have learned that crops are benefited by the stirring of the land, we are likely to forget the lesson or to be neglectful of it unless the weeds constantly remind us of it. Necessity is always the best schoolmaster; and of these necessities, weeds are amongst the chief.

The one way to destroy weeds is to practise good farming. Judicious tillage should always keep weeds down in cultivated lands. In idle lands weeds are likely to be a serious nuisance. In sod lands they are also likely to take the place of grass when for any reason the grass begins to fail. The remedy for weeds in grass lands, therefore, is to secure more grass. In order to do so, it may be necessary to plow the land and reseed. In some cases, however, it is only necessary to give the land a light surface tillage, to add clean and quickly available fertilizers, and to sow more grass seed. This is the fundamental remedy for weeds on lawns. If such weeds are perennial, as dandelion and plantain, it is advisable to pull them out; but in order to keep them out, a stiffer sod should be secured. The annual weeds that come in the lawn the first year are usually destroyed by frequent use of the lawn-mower.

Foul lands may usually be cleared of weeds by a short and sharp system of rotation of crops, combined with good tillage in some of the crops of the series. When the land for any reason is fallow—as when it is waiting for a crop—surface tillage with harrows or cultivators will serve to keep down the weeds and to make the land clean for the coming crop. Often lands that are perfectly clean in spring and early summer become foul in the fall after the crops are removed. Cleaning the land late in the season, therefore, may be one of the most efficient means of ridding the place of weeds. Coarse and rough stable manure, which is not well rotted, may also be a conveyer of weed seed. The seeds of weeds are sometimes carried in the seed with

which the land is sown, particularly in grass and grain seeds.

It does not follow that weeds are always an evil, even when they are abundant. In autumn a good covering of weeds may serve as an efficient cover-crop for the orchard. They are likely to entail some extra care the next year in order to prevent them from gaining a mastery, but this extra care benefits the orchard at the same time. It is, of course, far better to sow the cover-crop oneself, for then the orchardist secures what he wants and of the proper quantity and at the right season: but a winter cover of weeds is usually better than bare earth.

From the above remarks it will be seen that weeds are scarcely to be regarded as fundamental difficulties in farming, but rather as incidents. In the most intensive and careful farming the weeds bother the least. There should be a careful oversight of all waste areas, as roadsides and vacant lots. The greatest difficulty arises on commons and waste land, not on farms.

Weeds are often troublesome in walks, particularly in those made of gravel. If the walk were excavated 2 feet deep and filled with stones, rubble, or coal-ashes, weeds cannot secure a foothold. It is particularly important that gutters be not laid directly on the soil, else they become weedy. There are various preparations that can be applied to walks to kill the weeds, although, of course, they also kill the grass edgings if carelessly applied. Strong brine, applied hot, is one of the best (one pound of salt to one gallon of water). There are also preparations of arsenic, vitriol, lime, and sulfur, known as herbicides. For identification of weeds and means of control, see Georgia's "Manual of Weeds," New York, 1914.

L. H. B.

WEIGÈLA, WEIGÈLIA: *Diervilla*.

WELDÉNIA (for Ludwig von Welden, an Austrian army officer, wrote on natural history; 1780-1853). *Commelinaceæ*. Tuberosous-rooted herb, suitable for the greenhouse: lvs. numerous, grouped at the top of the st., forming a sort of involucre about the fls.: cymes very densely fasciculate, sessile among the lvs.; calyx sessile, $1\frac{1}{2}$ in. or less long, membranaceous, long and laxly tubular, often spathe-like, split, apex shortly 3-cleft; corolla-tube slender, much longer than the calyx, lobes broad, spreading, subequal; stamens 6; ovary ovoid.—One species. *W. candida*, Schult. f. St. short, simple: lvs. 6-8, strap-shaped, 2-6 in. long, with folding bases, pale green; fls. snow-white, 1 in. diam., solitary on erect scapes. Mex. and Guatemala. B.M. 7405.

WÉLFIA (named in honor of the English royal family). *Palmaceæ*. Unarmed palm, with a thick tall reed-like caudex, suitable for the warmhouse: lvs. terminal, pinnatisect; segms. coriaceous, strongly narrowed at base, apex entire or acuminate, many-nerved, plicate; spadices stout, pendulous; spathes 2, deciduous: fls. in deep hexagonal depressions, monœcious; male asymmetrical, sepals lanceolate, acute, petals broadly ovate, obtuse, stamens numerous, ovary rudimentary; female about equaling the male, compressed, sepals free, cymbiform-lanceolate, acuminate, petals much larger, 2 lateral cymbiform wing-keeled, dorsal narrower, flat, staminodes in a conical cup, ovary conical-subulate, 3-celled: fr. oblong, compressed, about 2 in. long, dark violet.—Two species, Cent. Amer. and Colombia. *W. regia*, H. Wendl. Up to 60 ft. high: lvs. when young divided almost to the base into a pair of oblong acuminate lobes, having a bronzy tint, at length becoming pinnatisect, borne on slender petioles; adult lvs. about 20 ft. long, pinnae numerous, narrow, unequal, decurrent on the angular rachis, whitish beneath. G.C. 1870:764. F.M. 1873:60. I.H. 18:62.

WELLINGTONIA: *Sequoia*.

WELWITSCHIA (Dr. Friedrich Welwitsch, 1806-1872, botanical traveler, who brought this remarkable plant to notice). *Gnetaceæ*. One of the most singular of plants, sometimes seen in the dried state in museums and rarely grown in botanic gardens.

The plant consists essentially of 2 persistent woody lvs. lying near or on the ground, the ends becoming much frayed (at one time supposed to be persistent cotyledons), and from the center or crown the cone-like fructification arises. It may be described as follows: A low woody plant, sometimes grown as an oddity: st. or trunk thick, cone- or top-shaped, usually somewhat raised above ground, more or less 2-lobed, said to be sometimes 14 ft. in circum.: lvs. 2, lasting the life of the plant, linear at first, later splitting into many sections: infl. axillary, paniculate, dichotomously branched, the branches ending in 4-angled ament-like spikes which are colored: fls. dioecious; male fls. with 4 perianth-segms. in the shape of a cross, stamens 6, joined at the base, seed sterile; perianth of female fls. tubular, inclosing completely the fertile seed.—One species, arid places Trop. and S. W. Afr.

The oldest actual name for this strange plant is *Tumboa*, which was mentioned incidentally in the *Gardeners' Chronicle*, 1861, page 75, in a running account of a meeting of the Linnean Society; and the name *T. Bainesii*, Hook. f., was similarly mentioned on page 1008 in an account of a meeting of the Royal Horticultural Society. In the same journal in 1862 the name *T. strobilifera* was also mentioned. Neither the genus nor the species was botanically defined. In *Gardeners' Chronicle* for 1862, the name *Welwitschia* was proposed, and under this name the characters were carefully drawn and the plant regularly described in *Trans. Linn. Soc.*, 1863, and in the same year in B.M. 5368, 5369. Under this name the plant has passed; but in Engler & Prantl, *Pflanzenfamilien Nachtr.* (1897), attention is called to the older *Tumboa* as the proper name, and this name is taken up in Cat. *Welwitsch Afr.*, pl. II, pt. 1 (1899). All the preceding literature is under *Welwitschia* and all the horticultural references; and inasmuch as the aim in nomenclature is, or should be, stability rather than priority, the principle of long-accepted usage should be invoked in this case and the name *Welwitschia* retained, particularly as the name *Tumboa* was not formally founded and as the revival of it contributes nothing to clearness or definition. (It is retained by the Brussels Congress.)

In respect to the cultivation of *Welwitschia*, W. Watson, Curator of the Royal Botanic Gardens, Kew, England, writes in 1916: "We have a plant here which was raised from a seed in 1880. It lives, but growth is very slow, so slow that a full-sized plant, such as we have in our Museum, might at this rate be reckoned a thousand years old. We grow it in a tropical house devoted to succulents, where it gets all the sunlight, the usual amount of water, except for about three months in winter, when it gets very little, and it is potted in sandy loam. There may be a set of conditions that would suit the plant better, though experiments with other plants raised here since did not reveal anything better."

mirabilis, Hook. f. Lvs. 6 ft. or more long, the split ends reclining on the ground, flat and long-narrow, attached at the base to the crown of the wrinkled brown and hard trunk: plant said to persist a century. G.C. III. 47:56. J.H. III. 46:38. G.W. 9, pp. 294-5.

L. H. B.

WESTRÍNGIA (J. P. Westring, Swedish physician and author; died 1833). *Labiataæ*. Shrubs, suitable for greenhouse cult., although apparently not now in common cult.: lvs. in whorls of 3, 4, or rarely more, entire

fls. axillary or rarely in terminal leafy heads; calyx campanulate, 5-toothed; corolla-tube short and dilated at the throat, limb 2-lipped, upper lip flat, broadly 2-lobed, lower spreading, 3-lobed; stamens, 2 upper perfect, 2 lower sterile: nutlets reticulate-rugose.—About 12 species, natives of extra-Trop. Austral.

rosmariniförmis, Smith. VICTORIAN ROSEMARY. A bushy shrub with the branches and under side of lvs. silvery white with appressed hairs: lvs. in whorls of 4, oblong-lanceolate to linear, $\frac{1}{2}$ –1 in. long: fls. white, axillary, almost sessile; calyx 3 lines long; corolla not twice as long as the calyx. Sandy hills, near the seacoast, Austral.—Offered in S. Calif.

F. TRACY HUBBARD.†

WHEAT: *Triticum*. W., India: *Pogopyrum tataricum*.

WHIPPLEA (in honor of Lieut. A. W. Whipple, commander of the surveying expedition to the Pacific Ocean in 1853–1854). *Saxifragaceæ*. Two low shrubs in W. N. Amer. with small opposite nearly sessile lvs., 3-nerved and entire or sparingly dentate, appressed-hairy on both sides, and with small white fls. in terminal cymes: fls. 5- or rarely 6-merous; receptacle turbinate, adnate to the base of the ovary; sepals lanceolate;

3990. *Wigandia caracasana*.
($\times \frac{1}{4}$)

petals small, oblong-spatulate; stamens 10, rarely 12, with dilated lanceolate filaments and subglobose anthers; ovary half-superior or nearly superior, with 3–6 short styles: fr. a caps. separating into 3–6 1-seeded carpels. They are not hardy N. and rarely cult. in botanical collections only, as they possess no particular ornamental qualities. They are plants of dry regions and demand a well-drained soil; the best place for them is in a rocky. Prop. is by greenwood cuttings under glass and by seeds treated like those of deutzia or hydrangea.

modesta, Torr. Sarmentose; the long shoots with numerous short upright flowering branchlets, pubescent: lvs. broadly ovate to elliptic, acutish, with a few shallow teeth or nearly entire, appressed-hairy on both

sides, $\frac{1}{2}$ –1 in. long: fls. white, about $\frac{1}{2}$ in. across, in slender-stalked dense cymes $\frac{1}{3}$ – $\frac{1}{2}$ in. long. May. Ore., Calif.

utahensis, Wats. (*Fendlera utahensis*, Greene. *Fendlerella utahensis*, Heller). Much-branched, upright shrub, to 2 ft., pubescent: lvs. elliptic-ovate to linear-oblong, acute, entire, $\frac{1}{3}$ – $\frac{1}{2}$ in. long, appressed-hairy on both sides: fls. white, in terminal small cymes $\frac{1}{2}$ – $\frac{3}{4}$ in. across. July. Ariz., Colo., Utah.

ALFRED REHDER.

WHITFIELDIA (named after Thomas Whitfield, intrepid naturalist who made several explorations into Trop. W. Afr. and brought back many choice plants). *Acanthaceæ*. Glabrous shrubs, rarely used as warm-house ornamentals: lvs. opposite, entire: fls. white or brick-colored, solitary in the axils of opposing bracts, arranged in a terminal raceme; calyx 5-parted, segms. membranaceous, colored, oblong or lanceolate; corolla-tube swollen almost from the base or slender-cylindrical and abruptly inflexed above widening to a campanulate throat, 5-lobed, lobes ovate or oblong-lanceolate; stamens 4, in pairs.—About 17 species, Trop. Afr. The material which has been offered in Amer. as *W. lateritia* is really *Jacobinia carnea* (see Vol. III, p. 1714): the true *W. lateritia*, Hook., is rarely cult. and is a tender evergreen shrub about 3 ft. high: lvs. ovate or oblong-ovate, wavy: fls. red; corolla bell- or funnel-shaped. W. Trop. Afr. B.M. 4155. F.S. 1:36.

WHITLAVIA: *Phacelia*.

WHORTLEBERRY: *Vaccinium*.

WIDDRINGTONIA: *Callitris*.

WIGANDIA (named after Johannes Wigand, Pomeranian bishop; wrote on plants; 1523–1587). *Hydrophyllaceæ*. Tall hispid perennial herbs or subshrubs, used for subtropical bedding, or may be grown in the greenhouse.

Leaves alternate, large, rugose, doubly dentate, cymes terminal, large, dichotomous: fls. sessile, 1-sided along the branch; calyx-segms. linear; corolla-tube shortly and broadly campanulate, scaled inside; limb broad, spreading, 5-lobed, lobes imbricate; stamens 5; ovary rather perfectly 2-celled: caps. 2-valved.—About 3 or 4 species, widely dispersed in the mountains of Trop. Amer. Monographed by A. Brand in Engler's *Pflanzenreich* hft. 59 (IV. 251). The species of *Wigandia* are very much confused in current reference books, as well as in the trade. The following account is based on André's revision of the genus in R.H. 1861: 371, with an important change in the name of one species. In respect to *W. urens*, André follows the previous revision by Choisy in DC. Prod. 10:184. The combination *Wigandia urens* was first used by Kunth, who applied it to a Mexican plant. Before this, however, another plant of the same family but a native of Peru had been called *Hydrolea urens*. When Choisy came to monograph the whole family he transferred *Hydrolea urens* to the genus *Wigandia* and called it *Wigandia urens*, Choisy. He therefore had to rename the Mexican plant, and this he called *Wigandia Kunthii*.

Wigandias are chiefly valued as foliage plants for subtropical bedding, because of their very showy character. Their leaves are covered with stinging hairs, similar to nettles. Many large specimens may be seen in California, but the plants are considered to be rather coarse and straggling. They are generally raised from seed every year, the seed being started indoors as early as January. The plants attain a height of 6 to 10 feet in a single season. They are unsatisfactory greenhouse plants, as they do not grow vigorously indoors. The roots may be kept over winter in a frostless place and stock may be secured in spring by cuttings. In general, the plants are not much used in North America.

caracasana, HBK. Fig. 3999. Erect robust subshrub, up to 9 ft. high, softly golden or silky-pubescent: lvs. rather long-petioled, ovate, obtuse, base subcordate, 18 x 10 in., coarsely, doubly and irregularly crenate, white-tomentose beneath: infl. golden silky-pubescent, terminal, elongate, strict (a thyrsoid cincinnus): corolla violet, tube white: caps. equaling or a little longer than the calyx. S. Mex. to Venezuela and Colombia. B.M. 4575 (adapted in Fig. 3999). B.R. 1966. F.S. 8:755. Gn. 4, p. 503; 8, p. 198. R.H. 1859, p. 653. J.F. 2:132. Var. **macrophylla**, Brand (*W. macrophylla*, Cham. & Schlecht.), is a larger-lvd. form which also grows rather taller than the type and has the infl. white-silky-pubescent. R.H. 1861:371.—It is the Mexican form of the species and the one mostly in cult.

Künthii, Choisy (*W. ürens*, HBK., not Choisy). Very hispid subshrub, not golden pubescent, about 6–15 ft. high: lvs. doubly sharp-serrate, not white-tomentose: infl. not at all thyrsoid, but paniculate, very hispid, rarely pubescent or dirty tomentose: corolla violet, tube white: caps. slightly longer than the calyx, very densely hispid. Mex. to Honduras.

ürens, Choisy, not HBK. (*W. peruviana*, W. Mill. *Hydròlea ürens*, Ruiz & Pav.). Stout erect subshrub up to 12 ft. high, very densely dirty white-hispid: lvs. short-petioled, 8–12 x 6–7 in., broadly ovate, irregularly dentate-serrate, base cordate or truncate, apex obtuse: fls. arranged in a broad terminal raceme (cincinnus); sepals lanceolate-acute, hispid; corolla violet, parted to the middle, lobes elliptical, densely silky outside: caps. oblong, twice shorter than the calyx. Peru. R.H. 1867, p. 470.

W. imperialis is listed as a very ornamental plant, but is not treated by Brand.—*W. Vigieri*, Carr., is not treated in Brand's monograph and is apparently a horticultural form, perhaps of *W. caracasana*. Carrière merely said it was a silvery plant instead of somber and glutinous like *W. caracasana*. It is frequently listed in the trade and is said to have lilac-blue or wine-colored fls.

F. TRACY HUBBARD.†

WIKSTRÆMIA (named after J. E. Wikström, professor of botany at Stockholm, 1789–1856). *Thymelæaceæ*. Shrubs or trees, occasionally grown in the warm-house or greenhouse: lvs. opposite or rarely alternate: fls. in short terminal or axillary racemes, spikes or heads; perianth tubular, limb spreading, 4-lobed, without scales in the throat; stamens 8; ovary villous, 1-celled: fr. a berry-like drupe.—About 40 species, Trop. Asia, Austral., and the islands of the Pacific.

canescens, Meissn. (*W. pauciflora*, Franch. & Sav.). Small shrub, 1–3 ft. high: lvs. 1–3 in. long, thin, alternate and opposite, oblong-lanceolate: perianth 3–4 lines long: fr. silky. Himalayas, Ceylon, China. The Japanese plant is *W. Ganpi*, Maxim. (*W. canescens* var. *Ganpi*, Miq.); from its bark apparently is made the celebrated Japanese copying-paper.

WILCÓXIA (named for Brig.-Gen. Timothy E. Wilcox, U. S. Army). *Cactææ*. Usually low weak plants growing from a cluster of dahlia-like roots: sts. slender, with low inconspicuous ribs covered with clusters of delicate spines: ovary and fr. bearing clusters of spines; seeds black.—Three species native of Texas and Mex.

Poselgeri, Brit. & Rose (*Echinocereus tuberosus*, Rümpl. *Cereus tuberosus*, Posel.). Roots black, several, borne near the surface: sts. 2 ft. or less high, with about 8 ribs, the lower and older part naked, spiny above, the spines almost hiding the ribs; spines appressed, delicate, pubescent, radials 9–12; central one ascending, black-tipped: fls. purple, 2 in. long: seeds pitted or rugose, $\frac{1}{2}$ in. long.—This species, although often cult., does not do well under glass when grown on its roots, but when grafted on various species of *Selenicereus*, it does extremely well.

J. N. ROSE.

WILD FLOWERS: Their appeal and conservation. In many countries some kind of wild flower holds first place in the love and sentiment of the inhabitants. The rose, the thistle, the shamrock, the iris, the edelweiss and alpine rose, the chrysanthemum, the poppy and the lotus have all contributed their share to the literature and art of the Old World. Thirty of the states have adopted some native American plant for the state flower, including the arbutus, bitter-root, black-eyed Susan, columbine, gentian, goldenrod, laurel, lupine, magnolia, mistletoe, moccasin-flower, Oregon grape, pasque flower, golden poppy, pine cone and tassel, rhododendron, rose, Sego lily, sunflower, syringa, and violet. Of these the goldenrod and violet lead in popularity, with the arbutus, magnolia, and rhododendron next in public favor. Nine states have chosen either cultivated plants of economic value or introduced weeds like the daisy. Thus far, no national flower has been adopted, principally because no wild flower grows or could be grown in all the states and territories, owing to the diversity of climate and flora. An attempt has been made recently to adopt the mountain laurel, but as this is a plant which grows only in the Appalachian regions of the eastern states it has not met with unanimous approval.

That a widespread interest in native plants exists there can be no question. Local and popular floras abound, poems and songs appear frequently, yet the people as a whole are still barbarians when it is a question of real love and protection. Arbutus is still pulled up from the roots and sent through the mails in frail and broken pasteboard boxes, having been nearly or quite exterminated where formerly it was abundant. Orchids and lilies are gathered by the basketful to adorn college commencements and church services. Ropes of laurel and ground-pine are used at balls and Christmas festivities, and the holly which used to be abundant is rapidly becoming scarce and hard to find. All these supplies come from wild sources and few of them would pay to cultivate. Moderation and protection are recommended for all of them. Some few of our wild flowers take kindly to cultivation, and are grown for their beauty: laurel, rhododendron, azalea, dogwood, and magnolias perhaps lead in popularity, but some of the smaller herbaceous plants such as bloodroot, hepatica, columbine, lilies, jack-in-the-pulpit, forget-me-nots, and many of the native ferns may be readily grown if given suitable conditions of soil, moisture, and shade. Most wild flowers prefer an acid soil with plenty of leaf-mold to the ordinary garden soil, and should be planted in some place by themselves where natural conditions can be maintained.

A hopeful sign of advancing appreciation is that the best landscape architects and park superintendents are recommending the planting and preservation of native plants and in many of the national parks and public reservations the native flora is protected from depredation. With the increase of motors has come an interest in good roads and roadside planting, but some of the railroads in Colorado still run "flower excursions" where a lot of vandals are taken to some beautiful spot and come home loaded with wild flowers which they promptly throw away. It is this spirit of selfish and thoughtless destructiveness which should be combated by all true lovers of native plants, and various organizations for their conservation have been formed to try to accomplish it. Arbor Day might fitly be called Conservation Day and used to impress on school children the importance of this work.

The following associations are interested and will supply information to those wishing to cooperate: Conservation Department, General Federation of Women's Clubs; Conservation Society of National Educators; American Association of Forestry; State Associations of Forestry; Garden Clubs of America, Philadelphia; Lincoln Highway Commission; Society for the Protec-

tion of Native Plants, Boston; Stokes Fund for the Preservation of Native Plants, New York Botanical Garden; American Association of Park Superintendents, Portland, Oregon; Wild Flower Preservation Society of America, Brooklyn Botanic Garden.

List of state and provincial flowers.

Alabama.....	Goldenrod.
Alaska.....	Forget-me-not.
Arkansas.....	Apple blossom.
California.....	Golden poppy.
Canada.....	Sugar maple.
Colorado.....	Blue columbine.
Connecticut.....	Mountain laurel.
Delaware.....	Peach.
Florida.....	Orange blossoms.
Georgia.....	Cherokee rose.
Idaho.....	Syringa.
Illinois.....	Native violet.
Indiana.....	Carnation (pink).
Iowa.....	Goldenrod.
Kansas.....	Sunflower.
Kentucky.....	Goldenrod.
Louisiana.....	Magnolia.
Maine.....	Pine cone and tassel.
Maryland.....	Black-eyed Susan.
Massachusetts.....	Arbutus, May-flower.
Minnesota.....	Moccasin flower.
Mississippi.....	Magnolia.
Missouri.....	Goldenrod.
Montana.....	Bitter-root (Lewisia).
Nebraska.....	Goldenrod.
New Jersey.....	Violet.
New York.....	Rose.
North Carolina.....	Daisy.
North Dakota.....	Wild rose.
Nova Scotia.....	Arbutus.
Ohio.....	Red carnation.
Oklahoma.....	Mistletoe.
Oregon.....	Oregon grape (Mahonia).
Pennsylvania.....	Laurel.
Rhode Island.....	Violet.
South Dakota.....	Pasque flower (Anemone).
Tennessee.....	Daisy.
Texas.....	Blue bonnet, lupines.
Utah.....	Sego lily (Calochortus).
Vermont.....	Red clover.
Washington.....	Rhododendron.
West Virginia.....	Rhododendron.
Wisconsin.....	Violet.
Wyoming.....	Gentian.
Hawaii.....	Lehua (Metrosideros).

ELIZABETH G. BRITTON.

liana), and *Odontoglossum illustrissimum* (*Lambea* *num* $\times$ *ardentissimum*), and through the parentage of the latter *O. crispum*, *O. Pescatorei*, and *O. Harryanum* enter into its composition. The hybrid approaches closely to *Oncidioda Charlesworthii*, and in a marked degree resembles *Odontioda Hermione* (*C. vulcanica* $\times$ *Oda. heatonensis*), many of the factors in the combination being difficult to trace. The erect oncidium-like spike bore ten pretty flowers, with purplish claret-red sepals and petals, the three-lobed lip being of whitish lilac color, with a blotch of claret-red in front of the crest."—Exhibited by Charlesworth & Co. For names of similar construction, see *Adamara*, *Linneara*, *Lowiara*, *Vuylstekeara*.

WINDBREAK. In horticultural usage, windbreaks are plantations of trees or other plants designed to check the force of the wind or to deflect it to other directions. Windbreaks are often of the greatest use, and at other times they are detrimental. In regions of very strong prevailing winds, they may be necessary to prevent injury to the plants. This is true along seashores. In the dry interior regions, windbreaks are often useful, also, to check the force of parching winds that would take the moisture from the land. In other cases, they are employed for the purpose of sheltering the homestead, to make it more comfortable for human occupancy: such breaks are usually known as shelterbelts. See *Hedges*.

Whether windbreaks shall be used for orchard plantations depends wholly on circumstances. In regions of very strong prevailing winds, as near large bodies of water or on the plains, such breaks are usually necessary on the windward side of the orchard. However, if the prevailing winds are habitually warmer than the local temperature, the winds should not be stopped or wholly deflected, but they should be allowed to pass through the windbreak with diminished power in order that, while their force may be checked, they may still prevent too low temperature. In regions that are very liable to late spring and early fall frosts, a tight break is usually a disadvantage, since it tends to confine the air—to make it still—and thereby to increase the danger of light frosts. If windbreaks are employed in such cases, it is best to have them somewhat open so that atmospheric drainage may not be checked. In most regions, the greatest value of the windbreak for orchard plan-

WILSONARA (from a personal name). *Orchidaceæ*. A hybrid orchid described and figured in G.C. III. 59, pp. 312, 315 (June 10, 1916). "The parents include *Cochlioda*, *Oncidium*, and *Odontoglossum*; *Oncidioda Charlesworthii* (*Oncidium incurvum* $\times$ *Cochlioda Noez-*

tations is to protect from the mechanical injuries that result from high winds and to enable workmen to pursue their labors with greater ease. The lessening of wind-fall fruit is often sufficient reason for the establishment of a windbreak. Usually very cold and very dry winds should be turned from the orchard; very strong winds should be checked; temperate winds should nearly always be allowed to pass through the orchard,

if their velocity is not too great; care must be taken to allow of adequate atmospheric drainage.

Windbreaks for orchards require much land, and crops near them are likely to suffer for lack of food and moisture, and also from shade. In small places, therefore, it may be impossible to establish large breaks. It is well to plant the windbreak at some distance from the first row of orchard trees, if possible. It is usually

planted for shelter-belts, because they thrive under most conditions, grow rapidly, and are hardy.

L. H. B.

WINDFLOWER: *Anemone*.

WINDOW-GARDENING. The growing of plants in windows and similar openings, particularly when conducted as a regular and systematic undertaking.

Although not strictly a part of the planting of the property, window- and veranda-boxes give color and tone to the place as well as provide pleasure and satisfaction for the inmates of the residence. For those who live in crowded localities or are unable to care for a garden, these outside boxes offer an opportunity for a display of flowers, not only in the summer months, but, in the case of window-boxes and by the substitution of other kinds of plants, through the winter months as well. The illustrations (Figs. 4001-4003) show good forms of window-boxes. The first two are drawn from illustrations in *Gardening*, May 15, 1916. See *House Plants*, Vol. III.

These boxes may be purchased and may be highly ornate, having pattern tiling or made of finely finished wood and suspended by fancy brackets; but such boxes are not necessary. A stout pine box of the required length, from 10 to 12 inches wide and at least 6 inches

deep, if painted a suitable color serves quite as well as the others, for the side and ends of the box should be soon covered by the drooping vines. Provision for drainage should be made by boring holes in the bottom of the box, these holes being covered with pieces of broken pots, coal-cinders or gravel-stones. This allows for the drainage of water while holding the earth from escaping. The soil for these window-boxes should be rich in plant-food, as the roots will be restricted. The most desirable soil is one that does not pack hard when watered, or contract much when dry, but remains porous and springy.

This soil may be made by mixing two parts of garden loam, one part of leaf-mold or wood earth, and one part of sand. To this mixture should be added well-decayed manure, preferably cow-manure, at the rate of one peck to two bushels of soil.

Many kinds of plants may be used in window- and porch-boxes, but in planting one should choose the subjects most suitable for the particular exposure. If the boxes are to be placed in full sunlight, it will be necessary to choose vigorous-growing sun-loving plants. For

4001. A hotel window-box.

best to use native trees for the break, since they are hardy and well adapted to the particular climate. Windbreaks often harbor injurious insects and fungi, and care must be taken that species of trees liable to these difficulties are not used. In the northeastern states, for example, it would be bad practice to plant the wild cherry tree, since it is so much infested with the tent caterpillar. In some cases, very low breaks may be as desirable as high ones. This is true in the open farming lands in the dry regions, since it may be necessary only to check the force of the wind near the surface of the ground. Windbreaks only 2 or 3 feet high, placed at intervals, may have this effect. Fence-rows sometimes act as efficient windbreaks. Near the seacoast, gardeners often plant low hedges for the purpose of protecting the surface of the garden. (See *Plants for the Seaside*, page 2670.) Along the Atlantic coast, the California privet is considerably used. This is *Ligustrum ovalifolium*, a Japanese plant. Farms in the open windy country may be efficiently protected by belts of woodland, or, if the country is wholly cleared, rows of trees may be established at intervals of a quarter or half mile along the direction of the prevailing winds (Fig. 4000).

In middle California, the most common windbreak is a tall thick hedge of Monterey cypress (*Cupressus macrocarpa*), either clipped close or allowed to grow naturally; it withstands heavy winds better than almost any other heavy-foliaged tree and is rapid in its growth. (Fig. 1790.) The Italians and Chinese, who have almost complete control of the truck-gardening industry in and around San Francisco, make extensive use of a Californian tree-mallow, *Lavatera assurgentiflora* (see page 1830), as a break and protection from the drift-sand. In California, various species of *Eucalyptus* may be used for breaks and wind-stops. The giant reed (*Arundo Donax*) is frequently grown around vineyards, particularly in the immediate vicinity of water. In California the olive, European walnut, fig, and almond are frequently planted for the outside row of an orchard of deciduous fruit-trees, to act as a partial windbreak.

On the plains and prairies, several kinds of poplars and willows, and also the box-elder (*Acer Negundo*), are

4002. Window-box in a club building.

a shady corner or a northern exposure, more delicate plants may be used. For the former, such plants as geranium, coleus, achyranthes (iresine), Paris daisy, double petunias, may be used; or, if a more pretentious display is desired, crotons, colored-leaved dracenas, acalypha, aspidistra, or small palms may be employed. Low-growing plants for the front of the box may consist of the dwarf white-leaved geranium Madame Salteroi, the golden feverfew, lobelia, sweet alyssum, and the white-leaved cineraria. For the drooping vines, nothing excels the variegated-leaved vinca, nasturtiums, tradescantia, and German ivy. If the position is shady, vigorous-growing ferns, such as the nephrolepis, a few of the pteris, and perhaps the hardiest of the adiantums are effective. The narrow-leaved dracena (*Cordyline indivisa*), grevillea, and Rex begonias are all good plants for shady places.

After the plants have filled the box with roots, it will be necessary to work into the soil more plant-food, either a light coating of bone-meal or a thicker layer of well-rotted manure; still better would be a watering about once each week with dilute liquid manure.

One of the objections to veranda-boxes, especially those that are fastened permanently in place, is that in winter they are usually bare of foliage and therefore unsightly. This disadvantage may be overcome and a seasonable appearance given by the use of small conifers, broad-leaved evergreens, small Irish junipers, low-growing junipers, arbor-vitæ, both pyramidal or globular, young trees of spruce, hemlock, or pine. Of broad-leaved evergreens, dwarf box, mahonia, *Evonymus radicans* and pachysandra or *Vinca minor* are all

4003. A window-box of evergreens for winter use.

available. To lighten the somber effect of the solid green, small shrubs bearing bright-colored fruits may be introduced, such as dwarfed plants of barberry, either *Berberis vulgaris* bearing long clusters of dark red fruits or *B. Thunbergii* with bright scarlet berries borne along the gracefully bending branches. Privets, either *Ligustrum vulgare* or *L. Regelianum*, are good for berries, both bearing clusters of blue-black fruits contrasting well with the green of the conifers or the reds of the barberry; these fruits are held through the winter without change in color. Hardy strains of English ivy or drooping plants of *Evonymus radicans* may be used to hide the boxes in winter.

It often happens that one or more plants in a box fail to thrive and the desired effect is lost. An attempt

to remove such a plant by digging it out injures the remaining plants, or if the plant is cut out spaces are left. This condition may be obviated by using pot-grown plants, setting the pots containing the plants in the boxes and filling in around the pots with earth or moss; by so doing, any one plant may be removed and another substituted without injury or check to those remaining. By this method it is also possible to effect quick changes in the character of the boxes. The change may be from the winter material to spring-flowering bulbs, from bulbs to pansies, then to summer-blooming annuals, and again to autumn-blooming plants. Combinations may be changed at will, seasonable effects be secured, and the monotony of a planted box be overcome. It is not necessary to grow the plants in large pots, a 4- or 5-inch size being large enough for most of the kinds to be used. In employing this method, however, it is best to have 2 or 3 inches of rich earth in the bottom of the box on which to place the pots; the roots of the plants will escape through the hole in the bottom of the pot and find sufficient food to develop.

This plan of filling the boxes with potted plants will recommend itself when it is not possible to heat the room at all times, as a schoolroom from Friday until Monday; in this case the plants may be carried home over this period.

WINTER-GARDEN: *Planting*, Vol. V, page 2677.

WINTERGREEN: *Gaultheria* and *Pyrola*. W., *Flowering: Polygala paucifolia*.

WINTER PROTECTION: *Planting*, Vol. V, page 2684.

WISTÈRIA (named for Caspar Wistar, 1761-1818, Professor of Anatomy in the University of Pennsylvania, but spelled Wisteria by Nuttall, author of the genus, the spelling Wistaria being a later adaptation). *Leguminosæ*. WISTERIA. WISTARIA. Attractive large twiners with pea-shaped flowers, planted for covering porches (Fig. 4004), arbors, and buildings; the noblest of the woody vines for temperate regions.

Stout vines, often attaining great age and with woody trunks reaching several inches in diam.: lvs. odd-pinnate, alternate, with 9-13 lfts.: fls. blue, lilac, purplish, or white, in long drooping racemes, in late spring and early summer; calyx bell-shaped, somewhat 2-lipped from the 3 lower teeth being longer than the 2 upper ones; standard large, reflexed, narrowed below and typically with 2 callosities or appendages at base; wings falcate, auricled at base; keel obtuse, scythe-shaped; stamens diadelphous: fr. an elongated 2-valved torulose pod.—The recognized species are 2 in the eastern U. S., and 4 in eastern Asia. Under the American Code, the genus takes the name Kraunhia; the name Bradleia has also been applied. The so-called "evergreen wisteria" is *Millettia megasperma*, described on page 2706, Vol. V. The species of Wisteria are so much confused in domestication that few portraits of them are cited in the following account.

Wisterias will live in rather dry and sandy soil, but they prefer a deep and rich earth. The roots are long and few and go down deep, making few fibers. They resemble licorice root. They are hard to transplant, unless they have been pot-grown for the purpose or frequently transplanted in the nursery row. Unless manured heavily when transplanted, they are very slow in starting into vigorous growth. The most satisfactory method of propagation for the amateur is layering in summer; the following year the layers may be detached. Seeds grow readily, but do not reproduce the horticultural forms; such forms may be grafted on seedlings of *W. frutescens* or other available stock, the union being made at the crown; sometimes root-grafting is employed. Cuttings of roots, an inch or two long, are also frequently used. Cuttings of ripened wood may be struck under glass.

CXIX. *Wisteria sinensis* in a striking setting.

Those who wish to give a young wisteria an extra-good start may sink a bottomless tub in the ground and fill it with good soil. If a wisteria is to be trained to a tree, choose an old tree, if possible, which is past the height of its vigor; but good results are to be expected only when sunlight and opportunity are ample, and these can rarely be secured under a living tree-head.

The Japanese wisteria (*W. floribunda*) is one of the best and commonest of hardy climbers. It has pale green pinnate foliage and bears profusely of dense drooping clusters of purplish pea-shaped flowers. The clusters are about a foot long. This is the commonest and best form. The variations furnish the connoisseur with variety in habit, color, and season of bloom, but they are not as prolific, and doubling adds nothing to the beauty of the flowers. Moreover, the double flowers decay quickly in wet weather.

The wisterias bloom in May and usually give a smaller crop of flowers in August or September. The spring crop is borne on spurs, while the autumn crop is borne on terminal shoots of the season. There are several ideas about training a wisteria. A good way is to let it alone. This produces rugged twisted and picturesque branches and gives a certain oriental effect, but it is not the best method for covering a wall-space solidly or for making the best display of bloom. To cover a wall completely it is necessary to keep the leaders taut and to train outside branches wherever they are needed. If quantity of bloom is the first consideration, the vines should be pruned back every year to spurs, a common method in Japan. The low one-storied Japanese building will have a wisteria so trained that the vine follows the eaves all around the house. The foliage is all above, and the yard-long clusters of purple blossoms depend therefrom in solid unbroken linear masses two or three ranks deep. When trained as a standard, the wisteria requires much care. A fine standard is figured in G.F. 6:256 and Gng. 1:321, where directions may be found. "When young plants of wisteria are cut back to a height of 6 or 8 feet and pruned in for some years, the stem will stiffen until it is able to stand alone, and the top will spread out into a broad head."

KEY TO THE SPECIES.

- A. Standard of the fl. with distinct callosities or appendages at base (*Wisteria proper*).
- B. Lfts. 7-9 pairs. 1. *floribunda*
- BB. Lfts. usually less than 7 pairs.
- C. Lvs. smooth or nearly so on both surfaces at maturity.
- D. Racemes long, 6-12 in. or more.
- E. Fls. large (more than 1 in. across at full expansion):
- Chinese. 2. *sinensis*
- EE. Fls. small (less than 1 in. across): American. 3. *macrostachys*
- DD. Racemes short, 4-5 in. or less:
- American. 4. *frutescens*
- CC. Lvs. persistently velvety at maturity 5. *venusta*
- AA. Standard lacking auricles at base (transition to *Millettia*). 6. *japonica*

1. *floribunda*, DC. (*Glycine floribunda*, Willd. *Wisteria brachybotrys*, Sieb. & Zucc. *Kraunkhia brachybotrys*, Greene). JAPANESE WISTERIA. Young lvs.

densely covered with straight appressed hairs, but foliage soon glabrous; lfts. 7-9 pairs, ovate-elliptic, rather abruptly acuminate, acute, rounded at base: fls. violet or violet-blue, rather small, in moderately long racemes (or sometimes in short racemes, particularly later in the season, whence the name *brachybotrys*); standard oblong-orbicular, subcordate at base and auriculate, with a short stipe-like claw; calyx hairy, the 2 upper teeth very short and broad. Common on

4004. Wisteria covering for a porch.

the margins of woods and along streams in Japan; much cult. there in temple grounds, parks, and gardens; also grown in this country. F.S. 9:880.—From the Chinese wisteria (*W. sinensis*) it is distinguished by more numerous lfts. which are shed earlier in autumn, much smaller, and 2-3-weeks-later fls., and greater hardiness. It runs into several marked forms. Var. *alba* (forma *alba*, Rehd. & Wils. *W. multijuga* var. *alba*, Carr.) has white fls. R.H. 1891, p. 421. Var. *rosea* (forma *rosea*, Rehd. & Wils.) has rose-colored or pale pink fls. with wings and tip of keel purple. Var. *variegata* (forma *variegata*, Rehd. & Wils. *W. chinensis* var. *variegata*, Nichols.) has variegated foliage. Var. *violaceo-plena* (forma *violaceo-plena*, Rehd. & Wils. *W. chinensis* var. *flore-pleno*, Mill.) is a double-fl. form. R.H. 1887:564. Gn. 17, p. 105. F. 1882:557. Var. *macrobotrys* (forma *macrobotrys*, Rehd. & Wils. *W. macrobotrys*, Sieb. *W. multijuga*, Van Houtte. *W. grandiflora*, Hort.) has very long racemes, sometimes 2-3 ft.: much prized. F.S. 19:2002. R.H. 1891, p. 176. Under the name *W. multijuga Russelliana*, a slender-racemed form is shown in Gn. W. 21, suppl. Apr. 2, although the lfts. are not more than 5 pairs. This variety is described as having a purple calyx, soft purple standard deepening in color with age on both faces and a creamy white eye-like blotch on the inner face; wings and keel dark blue, the tip of the keel violet; racemes reach 2½ ft. in length. Named for John Russell, Richmond, Surrey.

2. *sinensis*, Sweet (*Glycine sinensis*, Sims. *Wisteria chinensis*, DC. *W. consequana*, Loud. *Kraunkhia*

sinensis, Makino). CHINESE WISTERIA. Fig. 4005. Lvs. smooth or nearly so at maturity, the petiole swollen at base; lfts. about 5 pairs, ovate-acuminate or ovate-lanceolate, short-stalked, 2-3 in. long, the margins ciliate but entire; racemes pendulous, 6-12 in. long, terminating

4005. *Wisteria sinensis*. (X about $\frac{2}{3}$)

the branches; calyx villous; corolla large, blue-violet, not fragrant, showy. Low altitudes in China, and much cult. there; apparently little grown in this country and not so hardy as *W. floribunda*. B. M. 2083 (from which Fig. 4005 is adapted). B. R. 650. L.B.C. 8:773. P. M. 7:127. Var. *alba* (forma *alba*, Lindl. Var. *albiflora*, Lem.) has white fls. I.H. 5:166.

3. *macrostachys*, Nutt. (*Kraunkhia macrostachys*, Small). Slender vine 20-25 ft. high or long; lfts. usually about 9, ovate to elliptic-lanceolate, about 2 in. long, acuminate

or acute, cordate or rounded at base; racemes 6-10 in. long, drooping, loosely fld., the pedicels and calyx glandular-hairy; fls. light blue or purplish, the standard about $\frac{1}{2}$ in. across and not prominently auricled; calyx-teeth half or more the length of the tube. Swamps, Ill., southward.—Probably rarely if at all cult.

4. *frutescens*, Poir. (*Glycine frutescens*, Linn. *Kraunkhia frutescens*, Greene. *Bradleria frutescens*, Brit. *W. speciosa*, Nutt.). Tall stout climber, the trunk attaining several inches in diam.: not glandular, smoothish or somewhat downy at maturity; lfts. 4-6 pairs, ovate to ovate-lanceolate, acuminate but obtuse, glabrous above; racemes 4-6 in. long, densely fld.; fls. lilac-purple; auricles of the standard rather prominent; calyx-teeth very short. Low grounds, Va. to Fla. and Texas.—Sometimes planted. Var. *alba*, Hort., with white fls., has been listed. Var. *magnifica*, Herincq (*W. magnifica*, Hort.), supposed to belong here, has racemes 50-60-fld. and 6-8 in. long; fls. 1 in. across, lilac with a yellow spot, earlier than in the type. F.S. 11:1151.

5. *venusta*, Rehd. & Wils. (*W. brachybotrys* var. *alba*, Mill.). SILKY WISTERIA. Tall, reaching 30 ft. or more, the young growth pubescent; lfts. usually 5 pairs (from 4-6 pairs), velvety both sides, oblong-lanceolate or elliptic to ovate-oblong, short-acuminate, at the base subcordate or rounded or truncate, entire; raceme pendulous, 6 in. or less long including the short peduncle, broad, the rachis densely appressed-villous; fls. very large, white, on nearly horizontal spreading pedicels; standard suborbicular, truncate at apex and auricled at base, clawed; upper calyx-teeth subulate; pod compressed, densely velvety. China, province Chi-li.—

More or less planted in Eu. and U. S., but only recently distinguished. Var. *plena* (forma *plena*), Rehd. & Wilson. With double white fls., occasionally offered by Japanese dealers; the only double-fld. white wisteria known.

6. *japonica*, Sieb. & Zucc. (*Millettia japonica*, Gray. *Phaseolodes japonicum*, Kuntze. *Kraunkhia japonica*, Taub.). Glabrous throughout; lfts. 4-6 pairs, petiolulate, narrow-ovate or ovate-lanceolate, acuminate but obtuse at point, entire, light green; fls. small, white, in long drooping simple racemes to 8 in. long; calyx cylindrical urn-shaped or cup-shaped, pubescent; standard obovate, lacking the callosities at base; ovary and style glabrous; pod linear-oblong, mucronate at apex, woody, not large. Japan, Korea.—Little known in this country, and not hardy in the northern parts. By some authors this species is kept in the genus *Millettia*, where it was placed by Asa Gray; and under that name it is described in Vol. IV, page 2051.

L. H. B.†

WITCH-HAZEL: *Hamamelis*.

WITHANIA. See note under *Salpichroa*.

WITLOOF (Dutch, "white-leaf") is a salad vegetable comprised of the compact blanched leaf-head produced by certain forms of chicory. The large thick roots of chicory produce leaves when forced in absence of light, and these leaves may be further blanched by forcing them through sand or other covering. See *Chicory*.

The vegetable known as barbe-de-capucin, often shortened to barbe, is very similar to witloof, being produced by forcing either wild or improved roots of chicory and having a looser more leafy head. Witloof is usually forced from a special variety, grown for this purpose. As seen in the market in its best form, it is a firm oblong-pointed head about 6 inches long of white crisp undeveloped leaves. (Fig. 4006.) This vegetable is imported into this country in large quantities, being much prized as a delicate salad with a slightly bitter and characteristic flavor. It is frequently known as French endive.

There seems to be no reason why witloof can not be produced in this country. The New York Agricultural Experiment Station (Geneva) has recently published the results of tests (J. W. Wellington, Bulletin No. 418), from which the following directions are adapted: The seed (sold by many American seedsmen) from which to grow the forcing roots may be sown any time in May in open ground, in rows 18 inches apart and the plants later thinned to 6 inches apart in the row. Ordinary garden culture only is needed, but the plants should make a steady luxuriant growth, resembling large smooth-leaved dandelions. The roots should be lifted just before the ground is liable to freeze, the leaves trimmed to within 2 inches of the crown, and the roots stored. When needed for forcing in winter, the roots should be placed in beds or boxes where moderate heat can be applied, first cutting them off at the bottom to a uniform length of 8 or 9 inches. For holding the roots any soil or sand will do, since the growth of the heads is from the food stored in the roots and does not depend at all on the soil fertility. The roots may be set quite close together, but not touching, upright in the soil, and

4006. Witloof. (X $\frac{1}{4}$)

covered to the crowns. Various materials may be used for holding and bleaching the heads during their growth; 8 inches of clear sand is a good medium. This may be placed on the bedding material as soon as the roots are set. One or more free applications of water should

4007. *Woodwardia orientalis*.

be made. From 50° to 60° F. is a desirable temperature, the latter probably preferable since growth is slower at the lower temperature. Higher temperature than 60° for any considerable period causes the leaves to shoot up rapidly and decreases the proportion of solid heads.

At these temperatures the leaves should begin to show through the 8 inches of sand in about two weeks, when the heads are ready for harvesting.

In the Geneva tests four grades or sizes of roots were used: extra, averaging 2 inches in diameter, large, 1.4 inches, medium, 0.9 inch, and small, 0.6 inch. Of these the large and medium roots gave more than 70 per cent of marketable heads, while the extra roots produced too many divided and loose heads, or heads too large to serve satisfactorily as individual portions at table. The small roots produced many small heads, too slender for market purposes. The heads should be 4 to 6 inches long, and weigh two to three ounces to suit the market best. In Europe they are packed in baskets holding ten kilograms; but a three-pound Climax basket makes a satisfactory package for American markets. L. H. B.

WITSÈNIA (named after Nicholas Witsen, Dutch patron of botany in first half of 18th century). *Iridaceæ*. An ornamental greenhouse shrub with erect ensiform lvs. which are equitant; subsessile fls. with a cylindrical tubed perianth, which has erect connivent lobes and a 3-celled ovary which becomes a shiny leathery caps. Only one species from S. Afr., *W. Maïra*, Thunb., which is not in cult. B.R. 5. P.M. 8: 221. The plant known in horticulture as *W. corymbosa*, Ker, is more correctly named *Nivènia corymbosa*, Baker. St. tall, woody at base, branched, compressed, acutely angled: lvs. erect, rather rigid, ensiform and equitant, upper ones smaller: fls. 1 (or 2?) to a spathe, subsessile; perianth purplish blue, tube elongated, cylindrical, lobes erect, connivent, outer ones rather thick, tomentose outside, inner ones shorter; spathes usually 2 to an axil. S. Afr. G. 32:739. Gn. 72, p. 375.

WITTIA (named for N. Witt, of Manaos, Brazil). *Cactaceæ*. Epiphytic spineless flat-stemmed plants: fls. rather small, not fugacious, with a very definite tube; lobes much shorter than the tube. In some respects similar to *Rhipsalis*, but with very different fls.: perhaps closest to *Disocactus*.—Three species.

panamensis, Brit. & Rose. This species has recently been grown in Washington and the New York Botanical Garden, blooming freely every spring. St. much flattened, erect: fls. purple, 1 in. or more long. Native of Panama. J. N. Rose.

WITTMÁCKIA (named for L. Wittmack, professor at Berlin). *Bromeliaceæ*. Tall herbs: lvs. with relatively small thorns, never banded: infl. arising from the lf.-rosette, with membranous sheaths, often nodding or hanging, compound panicle with long many-fl. racemose branches: calyx free or slightly adnate, the right side strongly winged; petals free, linear, acuminate, without scales: fr. a dry berry. About 5 species, Cent. and S. Amer. This genus has sometimes been referred to *Aechmea*; see *Billbergia* for cult. *W. lingulata*, Mez. Lvs. about 10 in a rosette, firm, strap-shaped, rounded, shortly cuspidate, about 2 ft. long, 2½ in. wide, spines short, broad-based, about 3 lines apart: scape floccose when young; sheaths lanceolate; panicle pinnately branched: fls. numerous, sessile; sepals white, ovate, bearing an awn nearly 1 line long; petals yellow, ovate from an oblong base; ovary glabrous, rather cylindrical. W. Indies. B.M. 8056.

WOOD BETONY: *Stachys Betonica*. Woodbine: In England, *Lonicera Periclymenum*; in America, *Parthenocissus quinquefolia*. W. Lily: *Trillium*. Woodruff: *Asperula*. W. Sorrel: *Oxalis Acetosella*.

WOODS, IN LANDSCAPE: *Planting*, Vol. V, page 2662.

WOODSIA (after Joseph Woods, an English botanist, 1776-1864). *Polypodiaceæ*. A genus of mainly rock-loving ferns characterized by their inferior indusium, which is attached beneath the sorus, inclosing it at first but soon splitting into star-like lobes, and later hidden beneath the sorus.—Some 15 species are known, of which 7 grow wild in this country. The following native species are sometimes cult. in borders. Treatment given other hardy ferns will suit them well. Both grow best amongst rocks.

livénsis, R. Br. Growing in rosettes or tufts: lf.-stalks dark, polished, jointed about ½ in. from the rootstock; lf.-blades 3-8 in. long, 1 in. or more wide, bipinnatifid; segms. crowded, obscurely crenate: sori confluent when old. Eu. and N. Amer. north of Va.

obtusa, Torr. Lvs. clustered, 6-15 in. long, 2-4 in. wide, minutely glandular-hairy, bipinnate; pinnae rather remote, triangular-ovate. New England to Ariz.

W. glabella, R. Br., and *W. alpina*, Gray, are two rare alpine hardy species which have been offered. They are of interest only as rarities in large collections. R. C. BENEDICT.†

WOODWÁRDIA (Thomas J. Woodward, an English botanist). *Polypodiaceæ*. CHAIN FERN. A group of rather coarse-foliated ferns of diverse habit and structure, but all bearing the sori in rows arranged parallel to the midrib like links of sausages. See *Fern*.

A. Lvs. of two sorts, the veins everywhere forming areoles.

areolata, Moore (*W. angustifolia*, Smith). Sterile lvs. deltoid-ovate, with numerous oblong-lanceolate sinuate pinnæ; sporophylls with narrowly linear pinnæ 3-4 in. long. Mich. to Fla., mostly near the coast.—Often and probably better separated under a distinct genus, *Lorinseria*, on account of its different lvs. and habit of growth.

AA. Lvs. uniform.

B. Veins forming one or more series of areoles.

radicans, Smith. Lvs. rising from a short erect st., 3-5 ft. long, gracefully curved; pinnæ 8-15 in. long, 2-4 in. wide, pinnatifid nearly to the midrib. The true *W. radicans* from Eu. bears scaly buds toward the apex of the lf. and roots to form new plants. The Californian and Mexican species, which has often been referred to

4008. Fruiting lobe of *Woodwardia virginica*. (× ¼)

this species, is really distinct and never roots; it is apparently not in the trade.

orientalis, Swartz. Fig. 4007. Lvs. 4-8 ft. long, 12-18 in. wide, with lanceolate pinnæ and sinuate pinnules; veins uniting freely. Japan and Formosa.

BB. Veins free between the sori and the margin.

virginica, Smith. Fig. 4008. Lvs. arising singly from a long creeping rootstock; lf.-blades 12-18 in. long, 6-9 in. wide on stout stalks; pinnæ linear-lanceolate, 4-6 in. long, cut nearly to the rachis into oblong lobes. Canada to Mich., Ark., and Fla.—Better separated as a distinct genus, *Anchistea*, on account of its slender long-creeping rootstock, from which the lvs. arise at intervals.

W. spinulosa, Mar. & Gal. (*W. paradoxa*, Wright). Resembles *W. radicans* but has narrower fronds, and veinlets perfectly free from sorus to the margin. Vancouver Isl. to Mex.

L. M. UNDERWOOD.
R. C. BENEDICT.†

WORMS. Under the names of "worms," "snails," and "caterpillars," various odd fruits of leguminous plants are grown as curiosities. The pods are often put in soups as a practical joke, not for their edible qualities. The plants chiefly grown for this purpose are *Scorpiurus vermiculata*, Linn., *S. subvillosa*, Linn., *S. muricata*, Linn., *S. sulcata*, Linn., *Medicago scutellata*, Mill., and *Astragalus hamosus*, Linn. The last is the one usually known as "worms." The picture, Fig. 4009, shows species of *Scorpiurus*, chiefly *S. vermiculata* (beneath) and *S. subvillosa* (above). All these various plants are annuals of the easiest culture. They are practically unknown in this country, although offered by seedsmen. See *Caterpillars*.

L. H. B.

WORMWOOD (*Artemisia Absinthium*). Fig. 4010. An erect hardy herbaceous perennial, native of middle and western Europe and the countries that bound the Mediterranean, and sometimes found in waste places as an escape from American gardens, having angular rather shrubby stems 2 to 4 feet tall, which bear abundant much-divided hoary leaves of intensely and persistently bitter flavor, and panicles of greenish or yellowish flower-heads. The seed, grayish and very small, retains its vitality for about four years, but is usually sown soon after harvesting. The tops and leaves, gathered and dried in July and August when the plant is in flower, are officially credited in America with aromatic, tonic, and, as its name implies, anthelmintic properties, although now, for no apparent reason other than caprice of practice, they are less popular with the profession than formerly: In domestic medicine they are employed as mentioned and as a diuretic; locally as a fomentation or as a decoction with vinegar to ulcers, sprains, and bruises. In the dry state they are occasionally placed among clothing as a moth-repellant. Formerly wormwood was used by brewers to embitter and preserve liquors, but at the present time it finds its most extensive use as the principal ingredient in absinthe, in the manufacture of which peppermint, angelica, anise, cloves, and cinnamon are also ingredients. According to Blythe, the green color of this

liquor is due not to wormwood but to the chlorophyll of spinach, parsley, or nettles. The plant may be grown without trouble in light dry rather poor garden soil from seed which, owing to its small size, should be started where it may not be washed out or packed down by rain. When large enough to set out, the few specimens necessary to furnish a family supply should be placed not closer than 15 inches each way the first year. If alternate plants be removed with a good ball of earth early in the following spring and planted 30 inches apart, they will be sufficiently close together and the transplanted ones should suffer from no check. Ripened cuttings taken in March or October may be used for propagation. Clean cultivation and slight annual dressings of manure are the only other requisites. In the middle western states there are several localities where wormwood is grown for export.

Wormwood is used very extensively in the manufacture of certain medicines. The oil is produced largely in southern Michigan, and Wisconsin supplies a large acreage.

M. G. KAINS.

WUERTHIA: *Ixia*.
W. elegans, Regel, is
Ixia columellaris.

WULFÈNIA
(named for F. X. Wulfen, 1778-1825).
Scrophulariaceæ.
Hardy perennial
glabrous or slightly
pilose herbs, suitable
for the border
or rock-garden.

Leaves nearly
radical, petioled,
crenate; peduncles
scape-like, simple; fls. racemose at the top of the scape or spicate, solitary at the axils of the bracts, nodding, blue; calyx 5-parted, segms. narrow; corolla-tube exserted, cylindrical, limb 4-lobed, erect-spreading; stamens 2; caps. acute, septicidally and loculicidally dehiscent, 4-valved.—About 8 species. Eu. and Asia.

Amherstiana, Benth. Lvs. obovate-oblong or obovate-spatulate, 2-5 in. long, coarsely crenate or lobulate, narrowed at base and subpinnatifid; petioles $\frac{1}{2}$ -1 $\frac{1}{2}$ in. long; scapes 5-10 in. long, slender; racemes long, many-fld.; corolla $\frac{1}{2}$ in. long. Himalayas. G.W. 9, p. 375.

carinthiaca, Jacq. About 9 in. high: lvs. oblong or oval-oblong, doubly crenate, slightly lobed, narrowed at base, radical few, 3-8 in. long; scape 1-2 ft. long; raceme dense, spike-like, at length elongated; corolla-tube $\frac{1}{4}$ in. long, limb shorter, upper segms. bifid, lower somewhat crenate. Mountains of Carinthia.

W. cordata, Greene=*Synthyris reniformis*.

F. TRACY HUBBARD.

WYETHIA (named for N. J. Wyeth, North American botanical collector). *Compositæ*. Hardy perennial herbs, probably adapted to the wild-garden or border. Caudex stout: sts. usually simple, 1-headed: lvs. radical or alternate, entire: heads large, heterogamous; ray-fls. pistillate, in 1 row, disk-fls. perfect and fertile; involucre hemispherical, 2-3 rows of bracts: corolla yellow, rays ligulate, spreading, entire or minutely 2-toothed.—About 7 species, N. Amer. *W. mollis*, Gray. Plant floccose-woolly when young, more or less glabrous when old, 1-3 ft. high, bearing solitary or few heads: lvs. oblong or ovate, base rounded, truncate or cuneate: rays 10-15, over 1 in. long: achenes minutely pubescent at summit. Nev. and Calif. B.M. 7772.

4009. Pods known as "worms" and "caterpillars," sometimes grown for curiosity and as surprises.

4010. Wormwood, ($\times \frac{1}{2}$)

X

XANTHISMA (Greek, *died yellow*, referring to the color of the flowers). *Compósitæ*. Summer-blooming yellow-flowered composites.

Annuals or biennials, with alternate, usually entire, narrow lvs.: fls. all fertile, exclusively radiate: achenes top-shaped, 4-5-ribbed or angled; pappus persistent, composed of 10 or 12 rigid bristles which are minutely scabrous above, gradually chaffy-dilated toward the base, and longer than the disk-corolla, as many more one-half shorter, and usually 5 still smaller and shorter external ones.—Two species, of easy cult.

texanum, DC. (*Centaureid-ium Drummondii*, Torr. & Gray). Fig. 4011. Nearly glabrous biennial or annual, 1-4 ft. high: lvs. narrowly oblong to lanceolate; st.-lvs. entire or with a few teeth toward the apex: fls. attaining a diam. of 2 in. even in the wild, very showy, composed of a small disk and about 20 rather slender rays. On prairies, Texas.—Suitable for dry open places. In cult. treated like a hardy annual, the seed being sown in the open border early in spring. The second species, *X. Berlandieri*, Small (*X. texanum* var. *Berlandieri*, Gray), also of the prairies in Texas, is probably not cult. N. TAYLOR.†

XANTHÓCERAS (Greek, *xanthos*, yellow, and *keras*, horn, alluding to the yellow horn-like processes of the disk). *Sapindacææ*. Ornamental shrub planted for its showy racemes of white flowers and also for the handsome pinnate foliage.

Deciduous: lvs. alternate, odd-pinnate, with narrow serrate lfts.: fls. polygamous, the upper ones of the terminal raceme pistillate, the lower ones staminate, those of the lateral racemes staminate, with rarely a few pistillate ones at the apex; sepals and petals 5; disk with 4 sub-erect cylindric horns about half as long as stamens; stamens 8; ovary superior, 3-loculed, with a rather short, thick style: fr. a caps., with thick walls dehiscent into 3 valves, each locule with several globose, dark brown seeds.—One species from N. China, allied to *Unghadia* and *Koelreuteria*.

A very handsome shrub or sometimes a small tree with rather finely pinnate dark green and glossy foliage which is not attacked by insects and retains its

bright color until frost sets in, and with showy white flowers appearing in upright profusely produced racemes with the leaves on last year's branches. The large greenish fruits are similar to those of the buckeye. It is hardy as far north as Massachusetts and is well suited for solitary planting on the lawn. *Xanthoceras* is also

sometimes used for forcing. It is not very particular as to soil. A porous loamy soil and a sunny position seem to suit it best. Propagation is by seeds, stratified and sown in spring, and by root-cuttings, which succeed best with moderate bottom-heat.

sorbifolia, Bunge. Figs. 4012, 4013. Shrub or small tree, attaining 15 ft. with rather stout upright branches, glabrous: lvs. 6-12 in. long; lfts. 9-17, usually opposite, sessile, narrow-elliptic to lanceolate, sharply serrate, dark green above, paler beneath, 1-2 in. long: racemes 6-10 in. long: fls. on slender pedicels, white, about $\frac{3}{4}$ in. across, each petal with a blotch at the base changing from yellow to red: fr. green, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. long; seeds $\frac{1}{2}$ in. across. May. N. China. B.M. 6923. F.S. 18:1899. R.H. 1872: 290; 1898, p. 356. Gn. 8, p. 524 (col. pl. not numbered); 34, p. 372; 50, p. 227; 63, p. 407; 65, p. 412; 71, p. 298; 76, p. 121. G.C. II. 26:205; III. 2:274, 275; 11:533; 17:197; 58:90. G. 27:83; 37:121. J.H. III. 48:424; 49:210. G.F. 6:285. A.F. 3:109; 12:36. A.G. 18:357. Gng. 2:292, 293; 3:289; 12:610, 611. Mn. 1, p. 27. F.E. 17:389. M.D.G. 1900:592, 593; 1909:499. G.W. 12, p. 425. I.H. 24:295. Gn. W. 21:429.

ALFRED REHDER.

XANTHORRHIZA: *Zanthorhiza*.

XANTHORRHËA (Greek, *yellow flow*, referring to the resin which exudes from the trunks). *Liliacææ*. Persistent

perennials with a thick woody caudex, adapted to greenhouse culture and which have been tried out-of-doors in the extreme South.

Caudex very short to arborescent: lvs. in a dense tuft at the top of caudex, long-linear, brittle, spreading or recurved: scape or peduncle terminal, often several feet long, terminating in a dense cylindrical spike: fls. greenish, numerous, sessile; perianth persistent, segms. 6, 3 outer glume-like, erect, concave or almost hood-shaped at the top, 3 inner much thinner, erect with the

4011. *Xanthisma texanum*. ($\times \frac{1}{2}$)

outer but more or less protruded beyond them; stamens 6; ovary sessile, 3-celled: caps. protruding from the perianth, ovoid or acuminate, 3-valved, hard, brown and shining.—About 14 species, Austral.

The "grass trees," "grass gums," or "black boys," form a conspicuous feature of the Australian landscape. These picturesque desert plants are well worth trial in the warmer and more arid regions of the United States. The trunk varies from almost nothing in some species to 15 feet in the case of aged specimens of *X. Preissii*. The tall and palm-like trunks are thickly covered with the bases of the old dead leaves, which are cemented together by the black or yellow resinous gum that flows freely from the stems. In Australia the trunks are often charred and discolored by bush fires. The following species have been offered in southern Florida and southern California, but are practically unknown to cultivation in this country. All the species are long-lived perennials native to dry and rocky

places. They are said to thrive in a compost of peat and loam and to be propagated by offsets. *X. Preissii* seems to be the most desirable species.

A. *Trunk very short.*

B. *Spike 3-8 in. long.*

minor, R. Br. Lvs. 1-2 ft. long, 1-2 lines wide: scape longer than the lvs.: spike less than $\frac{3}{4}$ in. wide. B.M. 6297. — Belongs to the group in which the inner perianth-segms. have a white blade conspicuously spreading above the outer ones, while in the next two species the inner segms. have a short whitish tip, little longer than the outer and scarcely spreading.

BB. *Spike 1½-2 ft. long.*

hastilis, R. Br. Lvs. 3-4 ft. long, 2-3 lines broad: scape often 6-8 ft. long, not counting the spike. Readily distinguished by the dense, rusty tomentum covering the ends of the bracts and outer perianth-segms. B.M. 4722. G.C. III. 17:196. F.S. 9:868. G. 24: 612. Gn.W. 22:13. R.H. 1914, p. 67.

AA. *Trunk becoming 5-6, or even 16 ft. long.*

Preissii, Endl.

Lvs. 2-4 ft. long, 1-2 lines broad, rigid, very brittle when young: scapes 2-6 ft. long, including the spike, which occupies one-half to nearly all its length. B.M. 6933. G.C. III. 39:228.

undulatifolia, Tod. ex Riccobono. Trunk 8 ft. or so high, 12 in. diam.: lvs. in a large crown, 5 ft. long, fragile, sword-shaped, reflexed, rhomboidal in section: scape quite erect, cylindric, about 12 ft. long, with a dense spike of golden yellow fls. Austral.

F. TRACY HUBBARD.†

XANTHOSOMA (Greek, *yellow body*, referring to the stigma). *Araceæ*. This group is interesting to the horticulturist as containing the handsome variegated stove foliage plant known to the trade as *Phyllotæxium Lindenii*, and part of the vegetables known as yautia, malanga, and taniar, a crop to which much of the arable land in Porto Rico is devoted.

Milky herbs of S. and Cent. Amer. with a thick sometimes elongated corm: lvs. arrow-shaped, 3-cut or pedately cut: fls. unisexual, naked; males with 4-6 stamens connate in an inversely pyramidal synandrium with 5 or 6 faces; ovary 2-4-loculed; ovules anatropous.—A genus of 25 species, according to Engler, who has given an account of them in DC. Mon. Phaner., vol. 2 (1879).

Many species of the arum family are noted for their huge corms, some of which are edible after the acid and more or less poisonous properties are destroyed by cooking. Of this class the best known are the taros (*Colocasia esculenta*, Schott, the common taro of southern Asia and the Pacific islands, and *C. antiquorum*, Schott,

4012. *Xanthoceras sorbifolia*. ($\times \frac{3}{8}$)

4013. Fruit of *Xanthoceras sorbifolia*. ($\times \frac{1}{2}$)

the Egyptian taro, and the yautias, taniers, or malangas (*Xanthosoma sagittifolium*, and other species of this genus) of the West Indies. The botany of the species of *Xanthosoma* is confused. The corms and cormels (offsets) of some taros, and the cormels of some varieties of yautia, are free from acidity even in the raw state

4014. *Xanthosoma sagittifolium*.

as cultivated in southern United States. Yautia corms are strong-flavored and are seldom eaten. The young leaves of colocasia and xanthosoma when properly cooked are said to be equal or superior to spinach.

A. Caudex a short, thick, erect rhizome.

sagittifolium, Schott (*Arum sagittifolium*, Linn.). YAUTIA. MALANGA. Fig. 4014. A tropical vegetable. "Young plants of this are stemless, but in age, from the decay of the old lvs., an annulated caudex or corm is formed some inches in height, each throwing out stout fibers from the base, and from time to time producing offsets by which the plant is easily prop., or if suffered to remain the plant becomes tufted, and numerous lvs. are produced from the summit of the short, yet st.-like trunks" (B.M. 4989). Lvs. 1-2 or almost 3 ft. long, broadly sagittate-ovate, suddenly and shortly acute at apex, basal lobes obtuse: spathe large, with a creamy white limb. Trop. Amer.—In northern hothouses said to bloom in winter.

AA. Caudex tuberous.

Lindenii, Engl. (*Phyllotænium Lindenii*, André). Fig. 4015. Tender variegated foliage plant with large arrow-shaped lvs. marked with white along the midrib and parallel veins which run therefrom to the margin. I.H. 19:88. A.G. 19:573 (1898). G.W. 5, p. 308.—Tuberous plant from Colombia. G. W. Oliver, in his "Plant Culture," remarks that this stove ornamental plant should be more used for decorative purposes than it is at present, for it will stand more rough usage than one would suppose. After a goodly number of leaves have been developed in a warm, moist atmosphere, the plants will maintain a good appearance in a greenhouse temperature and may even be used as house plants. The lvs. are firmer in texture than caladiums. Prop. by division. Before repotting, put the pieces in a warm sand-bed to encourage fresh roots. Lvs. oblong-hastate, with acute basal lobes. A very worthy species for ornament.

X. bataviensis, Hort. Said to have purple sts. and dark green lvs., with edible tubers.—*X. belophyllum*, Kunth, has a short thick erect rhizome and a cordate-hastate lf. Venezuela. Var. *caracasana*, C. Koch (*X. caracasana*, Schott. *Colocasia caracasana*, Engl.), has lvs. pale green beneath, the posterior lobes more produced at the apex and the midrib and nerves often rosy. Caracas.—*X. cordatum*, N. E. Br. Lvs. glabrous: tube of spathe green; blade yellow-green outside, rose-tinted at base, whitish inside. British Guiana.—*X. cordifolium*, N. E. Br. Allied to *X. sagittifolium*, but differing in lvs. being obtusely round-cordate and spadix bearing club-shaped neutral organs. British Guiana.—*X. Hoffmannii*, Schott. Lf.-stalk whitish with dark purple blotches: spathe with green tube, purple inside, the limb white, Costa Rica.—*X. maculatum*, Nichols., is described as having immense pale green lvs. variegated with creamy yellow, the petiole violet-tinted.—*X. Majaffa*, Schott (*Colocasia Majaffa*, Hort.). Closely allied to *X. belophyllum*, has a similar caudex and a cordate-ovate lf., but the posterior costæ are separated by a right or acute angle, the angle in *X. belophyllum* being obtuse.—*X. Marshallii* is said to be a very rapid grower, with green lvs. and dark sts.—*X. novo-leonense*. Grows to 6 ft. high, and has very large lvs. which stand almost horizontal.—*X. violaceum*, Schott. Lvs. primrose, finally green, sagittate-oblong-ovate, 8-16 in. long, 6-12 in. wide: spathe with a tube 4 in. long, the blade 6 in. long, 3 in. wide.

WILHELM MILLER.

ROBERT A. YOUNG.†

XANTHÓXYLUM: *Zanthoxylum*.

XENIA. When sweet corn is fertilized by pollen from a starchy variety, the grains which result from this union become smooth and hard because packed with starch. In like manner the pollen of a purple-seeded variety like the Black Mexican sweet corn, produces purple seeds on ears which would otherwise have white or yellow seeds, and pollen from a yellow-seeded variety produces yellow seeds on the ears of a white-seeded variety. Such direct effects of the pollen are known as xenia (Focke, 1881). While the phenomenon is best known in Indian corn, it has been demonstrated recently also in rye (von Rümker), in which a green-seeded variety bears yellow seeds if pollinated by a yellow-seeded variety. In both maize and rye, the xenia characters affect only the endosperm (albumen) of the seeds, while characters of the seed-coat show no xenia. The correct interpretation of xenia in maize was given by de Vries (1899) and Correns (1899), and almost simultaneously by Webber (1900). This explanation is briefly as follows: The pollen-tube contains two male nuclei, one of which fertilizes the egg, while the other unites with certain other nuclei of the embryo-sac to form the endosperm-

4015. *Xanthosoma Lindenii*. Leaves 1 foot or so long.

nucleus from which the whole of the endosperm is developed. The direct effect of the pollen on endosperm characters is due to this participation of one of the male nuclei in the production of the endosperm. A slightly different phenomenon is seen in peas, in which pollen from a yellow-seeded variety produces yellow seeds in the pods of a green-seeded variety, for here the xenia character resides not in the endosperm, but in the embryo itself. Physiological effects of pollen in causing local disturbances of nutritive or other functions in tissues surrounding the style or ovary, thus affecting the size and quality of the fruits, are not properly included under xenia. Many reported cases of xenia in plants other than those here mentioned are undoubtedly mythical and will not stand the test of careful experimental investigation. The deterioration of melons supposedly caused by growing in the proximity of pumpkins or cucumbers, is doubtless a case of this kind.

GEO. H. SHULL.

XERÁNTHENUM (Greek, *dry flower*: it is one of the "everlastings"). *Compósitæ*. Annual erect herbs, densely pubescent or tomentose, of which *X. annuum* is one of the oldest and best known of the "everlastings" or immortelles.

Heads rayless, but the large involucreal scales are petal-like and persistent, giving the plant its value as a subject for dry bouquets: outer fls. few and sterile, inner ones fertile; receptacle chaffy; involucreal scales in many series, of various lengths, glabrous; heads solitary on long naked peduncles.—Four or 5 species, Medit. region.

The culture of xeranthemum is very simple. Seeds are usually sown in the open, where the plants are to stand; but they may be started outdoors and the seedlings transplanted. Hardy or half-hardy annuals.

annuum, Linn. Fig. 4016. Annual, 2-3 ft. tall, erect, white-tomentose: lvs. alternate, oblong-lanceolate, acute, entire; heads purple, 1-1½ in. across, the longer scales wide-spreading and ray-like. S. Eu. G. 4: 74, 75. —Runs into many varieties. Var. *ligulidsum*, Voss (*X. plenissimum* and *X. imperiale*, Hort.). A double or half-double form. Var. *perligulidsum*, Voss (*X. superbissimum*, Hort.), has very full double heads. In these and the single types there are white-fld. (var. *album*), rose-fld. (var. *roseum*), and purple-fld. (var. *purpureum*) varieties. There are also violet-fld. forms. Var. *multifidum*, Hort. (var. *compactum*) has a more compact and bushy habit, with somewhat smaller heads. *X. varius*, Hort., is a trade name for mixed varieties. Xeranthemums

4016. *Xeranthemum annuum*.
($\times \frac{1}{2}$)

are considerably used for a certain type of bedding, but they are mostly grown for cutting.

X. inapterum, Mill. (*X. erectum*, Presl), has white heads, of which the scales are little or not at all open or spreading. S. Eu. to S. W. Asia. L. H. B.

XEROCĹADIÁ (*dry branch*, from the character of the growth). *Leguminosæ*. One species, *X. viridiramis*, Taub. (*X. Zeyheri*, Harv. *Acácia viridiramis*, Burch.), of S. Afr., likely to be planted in warm dry regions in choice collections, differs from *Acácia* in having only 10 (rather than indefinite) stamens, powdery pollen, 5 free petals, and other technical characters. It is described as a small, dry, and very rigid bush 1-2 ft. high, with pale bark, spinous stipules, deciduous bipinnate lvs., and fls. 8-12 in nearly or quite sessile heads: petals oblong; filaments not much exceeding the petals; anthers with a very minute sessile gland: pod or legume semi-obovicular, indehiscent, 1-seeded, about ½ in. long, winged.

XERONĚMA (Greek, *dry and thread*, referring to the filaments which dry and persist). *Liliacæ*. Perennial herb, sometimes grown in the warmhouse: rhizome very short: st. erect, simple: lvs. grouped at base of st., elongate, rigidly veined: raceme terminal, simple, second rachis abruptly bent at base, frequently horizontal: fls. grouped on erect short pedicels; perianth red, showy, about ½ in. across, persisting, segms. distinct, linear, erect, 1-nerved; stamens 6; ovary sessile, obtuse, 3-celled: caps. very short-stipitate, loculicidally dehiscent. One species, New Caledonia. *X. Moorei*, Brongn. & Gris. St. about 20 in. long with a few reduced lvs.: basal lvs. 12-16 in. long, erect: fls. bright crimson; perianth ½-¾ in. long; stamens exserted. New Caledonia. B.M. 8342.

XEROPHYLLUM (Greek, *dry leaf*). *Liliacæ*. **TURKEY'S BEARD**. Tall subaquatic hardy perennial herbs not extensively in cultivation.

Rhizome short, thick and woody: sts. erect, tall, simple: lvs. radical or grouped at base of st., long-linear, rather stiff, margin scabrous; cauline lvs. sparse, much smaller: fls. white, numerous, in a terminal raceme; perianth withering, persistent, segms. distinct, oblong or lanceolate; stamens 6; ovary sessile, 3-grooved, obtuse, 3-celled: caps. subglobose, or short-oblong, 3-grooved, loculicidally dehiscent.—Three species, N. Amer. Watson, in Proc. Am. Acad. 14: 284.

The turkey's beard of the eastern states (*X. asphodeloides*) is a strong herb, 3 to 4 feet high, resembling asphodel. It has a dense tuft of numerous long, wiry leaves from the center of which springs a stately shaft sometimes 5 feet high, with an oval or oblong raceme 6 inches long, crowded with yellowish white 6-parted flowers, each ¼ inch across. It blooms from May to July, flowers with delicate fragrance lasting a long time. The species is a native of the dry pine barrens from southern New Jersey to eastern Tennessee and Georgia. The chief species of the Pacific coast, *X. tenax*, has white and violet flowers, the latter color supplied by the stamens. Each region should cultivate its own species. The forms are too much alike for the same garden. A third species, *X. Douglasii*, Wats., is a rare plant ranging from Montana to Oregon. It is distinguished by its six-valved capsule and is said to be inferior as a garden plant to the other species.

asphodeloides, Nutt. (*Helónias asphodeloides*, Linn. *X. setifolium*, Michx.). Fig. 4017. Tall hardy perennial, 1-4 ft. high: lvs. 1 line or less wide: raceme 3-6 in. long; perianth-segms. exceeding the stamens. Pine barrens, E. U. S. B.M. 748. L.B.C. 4: 394. Gng. 1: 173. A.F. 7: 171. Gn. 27, p. 224; 39: 526 and p. 527; 58, p. 15. G.C. II. 13: 433.

tēnax, Nutt. Two to 5 ft. high: lvs. about 2 lines wide: raceme 1-2 ft. long; pedicels longer: perianth-

segms. scarcely equaling the stamens. Calif. to Brit. Col. June, July. B.R. 1613 (erroneously as *X. setifolium*).

F. TRACY HUBBARD.†

XIMENIA (named after Francis Ximenes, Spanish monk, who wrote on plants of Mex. in 1615). *Olacaceæ*. Glabrous or tomentose shrubs or trees, one of which, *X. americana*, occurs native in S. Fla. and is a tropical fr. of minor importance. Branches usually thorny: lvs. alternate, entire, subcoriaceous, usually fascicled: fls. whitish, arranged in short axillary cymes or rarely solitary; calyx small, 4-5-toothed or -lobed, unchanged in fr.; petals 4-5, valvate, narrow, bearded inside; stamens twice the number of petals; ovary 3-celled at base or higher, ovules 3: drupe ovoid or globose, flesh pulpy.—About 5 species, natives of the tropical regions of the world. Here belongs the hog plum which grows wild throughout the tropics, and in the U. S. is native to Fla. south of Tampa Bay. The fr. is about an inch long, shaped like a plum, and the pulp is sweet and aromatic. The "stone" which incloses the seed is proportionately very large. The fr. is borne on a small tree, each branch of which ends in a thorn about ½ in. long. The frs. are generally eaten, but although it is fairly common in Fla. it is not cult. The species has been suggested by the American Pomological Society as worthy of cult. with a view to improvement.

americana, Linn. HOG PLUM. Also called "mountain" or "seaside plum" and "false sandalwood;" "wild olive" in Jamaica. Tropical fruit-bearing tree: lvs. 2-3 together, oblong, obtuse, short-petioled: peduncles 2-4-fld., shorter than the lvs.: fls. small, yellow; petals thick, lanceolate, rusty-hairy within: fr. yellow; nut white, globose. Tropics.—The "hog plum" of Jamaica is *Spondias lutea*. F. TRACY HUBBARD.†

XYLOBIUM (Greek, *wood and life*, in allusion to the substance on which the plants grow). *Orchidaceæ*. Epiphytic herbs, grown in the warmhouse.

Stems short, with many sheaths, soon thickened into fleshy pseudobulbs, which are 1-2-lvd.: lvs. large or elongated, plicate-veined, contracted to the petiole: scapes erect, simple, arising from the base of the pseudobulb: fls. racemose, medium-sized or rather large, very shortly pedicelled; bracts linear, usually rather long; sepals subequal, erect, finally spreading, lateral broader than the dorsal, forming a chin; petals similar to the dorsal sepal if not smaller; labellum somewhat articulate with the foot of the column, lateral lobes erect, surrounding the column, midlobe short, broad, surface smooth, lamellate or callous at the base; pollinia 4, ovoid: caps. oblong, erect.—About 30 species, natives of Trop. Amer.

bractescens, Kränzl. (*Maxillaria bractescens*, Lindl.). Pseudobulbs conical, elongated, sulcate: lvs. broad, folded: scape 3-sheathed; raceme elongated, few-fld.: sepals oblong-lanceolate, they and the similar but smaller petals dull yellow; lip reddish brown, 3-lobed. Peru.

brachystachyum, Kränzl. Pseudobulbs almost globose, slightly narrowed above, 1-lvd.: lf. oblong, acute, 3-nerved, thick, shining, petiole sulcate, blade 10 by about 4 in.: raceme very short, few-fld.: dorsal sepal broad ovate-oblong; lateral ones much larger, outside dull purple; petals oblique at base, oblong above, dull purple outside, yellow spotted purple inside; lip simple, obovate-oblong, rather acute, slightly fiddle-shaped. Brazil. G.C. III. 40:302 (desc.).

dëcolor, Nichols. (*Maxillaria dëcolor*, Lindl.). Pseudobulbs clustered, oblong, compressed, 1-2 in. long, bearing a single lf.: lf. 12-15 in. long, oblong-lanceolate, plicate and acuminate at both ends: scapes erect, many-fld.: sepals and petals sulfur-colored or shaded with white; lip whitish, obsolete 3-lobed, obtuse. W. Indies. B.M. 3981. B.R. 1549.

elongatum, Hemsl. (*Maxillaria elongata*, Lindl.) Pseudobulbs cylindrical, elongated, about 6 in. long, 2-lvd.: lvs. lanceolate, 3-ribbed: scape erect, 2-sheathed, many-fld., infl. a dense oblong raceme: sepals and petals pale yellowish white, linear, acuminate; lip ovate-oblong, very fleshy, purplish brown. W. Indies.

leontoglôssum, Benth. (*Maxillaria leontoglôssa*, Reichb. f.). Pseudobulbs fusiform, congregated, 1-lvd.: lf. petioled, elliptic-lanceolate, acute, plicate: scape

4017. *Xerophyllum asphodeloides* growing near the margin of a pond.

stout, bearing an oblong or cylindrical, dense and nodding raceme: fls. yellow, spotted with maroon; dorsal sepal oblong, lateral sepals oblong-lanceolate; petals similar to lateral sepals; lip oblong, lateral lobes narrow, midlobe rotundate fleshy and marked with purple-brown. Colombia. B.M. 7085.

squälens, Lindl. (*Maxillaria squälens*, Hook.). Pseudobulbs stout, 2-3 in. long: lvs. 9-12 in. long: scapes densely fld.: sepals and petals yellowish white, petals and midlobe of lip streaked with purple, lateral lobes of lip deep purple. Venezuela. B.M. 2955.

X. zëvum, Hort., is offered in the trade.—*X. peruvianum*, Hort., is also offered.

F. TRACY HUBBARD.

XYLOPHÏLLA ARBÛSCULA, Swartz: *Phyllanthus speciosus*.

XYLOPIA (from the Greek *Xylopi-kron*, bitter wood). *Annonaceæ*. Shrubs and trees grown mostly for their fruits, and also for spices and other products.

The genus resembles other *Annonaceæ* in having alternate distichous entire lvs., and fls. with 6 petals in 2 series, but distinguished by the form of the torus, or receptacle, which has a concavity in the middle including the carpels, surrounded by a ring of stamens borne on the convex portion of the receptacle: infl. instead of being extra-axillary or lf.-opposed, as in many other genera of the family, consists of short-stemmed or sessile fls. growing from the axils of the lvs., either solitary or in clusters of 2 to several: calyx

with 3 valvate sepals connate for some distance from the base; outer petals elongate, thick, valvate, and connivent, or scarcely opening, and triquetrous above, inclosing the 3 inner linear petals, which are concave at the base; after anthesis the receptacle undergoes a transformation, its center becomes depressed so as to form a cone-like sac, while its margin grows in such a way as to form a dome with an orifice at its apex; through this orifice protrude the styles, while the ovaries occupy the cavity, and the surface of the dome in most species is covered with the crowded stamens, the expanded connectives of which form a sort of tile-like covering to the pollen-sacs; carpels vary in number and the ovaries have a ventral placenta bearing an indefinite number of ovules primitively arranged in 2 vertical rows: fr. consists of clusters of berries either sessile or shortly stipitate, more or less elongate, often constricted between the seeds, which have a ruminate endosperm, like other members of the Annonaceæ, and in many cases there is an aril on both sides of the terminal umbilicus. In the African species, sometimes separated as a distinct genus under the name *Habzelia*, instead of a central cavity there is only a slight depression at the summit of the torus or even none at all. In the genus *Pseudannonia*, treated by Baillon as a section of *Xylopi*a, but given generic rank by the writer (see Journ. Wash. Acad. Sci. 3:16. 1913), both the corolla and the fr. differ radically from those of *Xylopi*a. The inner petals form a diminutive acute triquetrous corolla over the essential parts, and the outer ones, much broader and longer, recall by their form and the thickness of their margin the fls. of certain species of *Annona*, while their few-seeded frs. are thick and fleshy, when mature suggesting the frs. of our common *Asimina triloba*. It is intended here to describe only the species of economic importance.

*Xylopi*a *æthiopica*, *X. Eminii*, *X. aromatica*, *X. carminativa*, *X. frutescens*, and *X. grandiflora* are worthy of cultivation for the sake of their spicy fruits; while *X. parvifolia* and *X. nigricans* of Ceylon are desirable for the exquisite perfume of their flowers, which like those of the ilang-ilang (*Canarium odoratum*) might be utilized as a source of an essential oil for use in perfumery. Propagation is possible either by seeds or by grafting and budding, as in the case of other Annonaceæ. Seeds should be sown as soon as ripe in shaded beds and the small seedlings should be transferred to pots and kept until ready for planting out, preferably in good, well-drained soil in sheltered situations.

INDEX.

A. American species (Nos. 1-7).

B. Lvs. acute or acuminate.

1. *grandiflora*, Aubl. (*X. cubensis*, A. Rich. *X. longifolia*, A. DC.). MALAGUETO MACHO. MALAGUNTO GRANDE. ZEMBÉ. FRUTA DEL BURRO. ACHON. Fig. 4018. Tree with younger branches rufous-tomentose near extremities: lvs. approximate, distichous, elliptical-lanceolate or oblong, acute at the apex, usually obtuse at the base, puberulous above, tomentose and rufescent beneath, the blade 4 in. or more in length, the petiole about $\frac{1}{4}$ in. long, grooved above, tomentose and rufous: peduncles axillary, very short, 2-fld.; pedicels incurved, bracteate, villous, ferruginous: fls. often 2 in. long; calyx short, cup-shaped, shortly 3-parted; petals erect, the outer ones linear, acutish, concave at the base, silky near the base, subtomentose above; the inner ones shorter and narrower, linear and triquetrous, acute, expanded and shell-like at the concave base, so as to cover the essential

parts; receptacle hollowed in the center, forming a cavity in which the ovaries are included, the styles protruding beyond its opening. A wide geographical range, which has undoubtedly been extended through human agency. It is spread in S. Amer. from Brazil to Panama and also occurs in Cuba, where it is known as *Malagueta brava*, or "wild melegueta," and *Guacima Maria*, or St. Mary's *guacima*.—Varies considerably in the size and pubescence of its lvs. According to Baillon the frs. of this species, together with those of *X. frutescens* and *X. sericea* (*X. carminativa*), are offered for sale in the pharmacies of Brazil. They contain large cells filled with a volatile aromatic oil, having a pepper-like flavor, but more agreeable and delicate than pepper. Martius regards these frs. as worthy of intro. into the pharmacopœia, on account of their tonic and carminative properties.

2. *carminativa*, R. E. Fries. (*Unōna carminativa*, Aruda da Camara. *X. sericea*, St. Hil.). PAO D'EMBIIRA. PINDAIBA. PIMENTA DE MACACO. A tree closely allied to *X. grandiflora*, but with the lvs. narrower in comparison with their length, and with the apex more attenuate and the base more acute, but the latter varies and is sometimes rounded; lf-blade clothed with appressed silky hairs longer than those of *X. grandiflora*, and usually smaller than the latter, but also varies in size: fls. much smaller than those of *X. grandiflora*, scarcely exceeding $\frac{1}{2}$ in. in length, and serving at once to distinguish the two species: frs. either rounded at the tip or pointed, shorter than those of *X. grandiflora*, and usually containing 3 or 4 seeds, but sometimes only 1 or 2, in the latter case they resemble the frs. of *X. frutescens*, from which, however, they may be distinguished, when dry, by their black color and rough surface. Ranges from Minas Geraës in Brazil to British Guiana.—The seeds are commonly found in apothecary shops in Brazil, where they are sold as carminatives. According to St. Hilaire the bark is stringy and tenacious and is excellent for cordage, especially for boat-cables. The frs. have the odor and taste of pepper and are used as a condiment, but are not so pungent as pepper. Specimens were purchased at Januaria, state of Minas Geraës by Messrs. Popenoe, Shamel, and Dorsett, of the U. S. Dept. of Agric. during their recent mission to Brazil.

3. *frutescens*, Aubl. MALAGUETA HEMBRA. MALAGUNTO CHICO. COUGNERECOU (Carib name). JEJERECOU (Cayenne). EMBIRA. PINDAIBA (Brazil). Fig. 4018. A shrub or small tree with distichous branches; new branchlets pilose, reddish: lvs. oblong-lanceolate, acuminate at the apex, with the tip of the acumen obtuse or rounded, and the margins revolute, above glabrous, beneath silky with white, appressed, sericeous hairs: peduncles pilose, very short, bracteolate, solitary, or in 2's or 3's, growing from the axils of the lvs.: calyx pilose, with the divisions ovate acute; petals oblong, never opening widely, sericeous on the outside: frs. glabrous, aromatic. Endemic in Brazil, Venezuela, Guiana, Colombia, and Panama.—Collected at Gatun by Hayes, who states that "the negroes of the Isthmus use the red berries of this small tree as a substitute for pepper and the bark for making ropes." Specimens in the National Herbarium were recently collected by Henry Pittier in the Canal Zone, and bear the common name "malagueta hembra," to distinguish them from the fr. of the "malagueto macho." The name *malagueta*, sometimes modified to *mala-gunta*, undoubtedly comes from Afr., where it is applied to the so-called "grains of paradise" (*Amomum Melegueta*, Roscoe), a famous spice of the west coast of Afr.

4. *muricata*, Linn. (*X. jamaicensis*, Griseb.). SMALLER BITTER-WOOD. Fig. 4018. A shrub with ovate or lanceolate, long-acuminate lvs., with the slender acumen often obtuse at the tip, clothed beneath with

strigose hairs, and bearded at the tip: fls. small, in axillary clusters: berries punctate.—This species, the type of the genus *Xylopi*a, was based by Linnæus on a plant growing in the mountains of Jamaica described and figured by Patrick Brown in his Natural History of Jamaica, and called by him *Xylopicium*, on account of the bitter taste of its wood. The vernacular name was applied to it to distinguish it from *X. glabra*, Linn., a species based on Plukenet's *Xilopicon*, or *Lignum amarum*, of Barbados, commonly called bitter-wood.

5. *discreta*, Safford (*Unona discreta*, Linn. f. *Habzèlia discreta*, A. DC.). PEYRICOCOUM. A shrub or small tree with privet-like, or willow-like lvs. and

4018. *Xylopi*a.—a-e, *X. grandiflora*, showing flower-bud and leaf at a, section of flower with cavity in receptacle at b, fruiting branch at c, four-seeded fruits, d, e, f, *X. frutescens*, fruiting branch; g, *X. muricata*, type of the genus; h, *X. obtusifolia*, fruit and three leaves. (b nat. size; others $\times$ about $\frac{1}{2}$.)

slender, flexible, virgate branches: lvs. alternate, short-petioled, 2-ranked, narrowly oblong-lanceolate, about 1 in. long, clothed beneath with appressed silky hairs: fls. resembling those of an *Annona* but with the carpels distinct and stipitate, developing into a cluster of berries borne on the center of the indurated receptacle: berries purple, aromatic, oblong-linear, 1-3-seeded, more or less constricted between the seeds; the latter ovate-globose, smooth and glossy.—This species was first described by the younger Linnæus from a tree growing in Surinam, or Dutch Guiana, and proposed by him as the type of a new genus *Unona*. It proved, however, to be congeneric with *Xylopi*a. The name *Unona* was afterward applied to an Asiatic genus previously described by Loureiro as *Desmos*, but according to the laws of botanical nomenclature, was not

available for the name of a second genus. The generic name *Desmos* is therefore valid, and must be used for the Asiatic plants commonly called *Unona*. (See *Desmos*, Vol. II, p. 991 of this work.)

6. *aromatica*, Baill. (*Habzèlia aromatica*, A. DC. *Waria zeylanica*, Aubl.). MANIGUETTE. BOIS D'ECORCE. POIVRE DES NÈGRES. A tree with a trunk 20 ft. high or more, with a spreading crown and leafy branches: lvs. ovate or oblong-acuminate, glabrous, subsessile: fls. axillary, solitary or in pairs; calyx-divisions subrotund-ovate, acute, fleshy; petals 6, the 3 outer ones longer, ovate-oblong, on the outside vilous, cinereous, on the inside glabrous, violet-colored, the 3 inner ones smaller, glabrous, violet-colored: berries reddish, numerous (12-25 in a cluster), oblong, subterete, shortly stipitate, with a longitudinal seam down one side; constricted between the seeds; seeds 3-6, orbiculate, reddish.—A species of doubtful relationship, owing to its broad petals and orbiculate seeds. It has been referred to *Unona concolor*, Willd., and may possibly be congeneric with *Desmopsis* or *Unonopsis*. The type, described by Aublet under the name *Waria zeylanica*, was collected in the forest of Timoutou, French Guiana.

BB. Lvs. obtuse or rounded at the apex.

7. *obtusifolia*, A. Rich. (*Habzèlia obtusifolia*, A. DC.). GUIMBA. GUAVICA. GUAVICO DE SAVANA. PICO DE GALLO. Fig. 4018. A shrub or small tree with numerous crooked branches, the extremities of which are ferrugineous-pubescent when young. It differs from all other species here described in its perfectly glabrous lvs., which are quite obtuse or rounded at the apex and obovate or subspatulate in outline, coriaceous, pale green and glossy above and paler beneath, and about 1-1½ in. long: fls. axillary, solitary, very shortly peduncled, subtended by small scale-like bracteoles; calyx-divisions broad, subacute, and ciliate along the margin; outer petals narrowly linear, acutish, dilated and concave at the base, covered on the outside with rufous silky hairs; inner petals shorter and narrower, triquetrous above, expanded and concave at the base, covering the essential parts; carpels included in the cup-like hollow of the receptacle, numerous, but usually only 2-8 developing into fr.; the latter a cluster of terete follicles more or less constricted between the 2-4 seeds, which have a whitish fleshy aril on each side of the hilum.—This plant is known only from the Island of Cuba, where it is prized for its fine yellow wood. Its local name Pico de gallo (cock's beak) is suggested by the form of its sharp elongated fl.-buds.

AA. Asiatic species.

8. *parvifolia*, Hook. f. & Thom. (*Patdnia parvifolia*, Wight. *Unona tripetaloides*, Moon). NETAWU. ATUKÉTIYA. A tall aromatic tree of Ceylon, with a straight trunk, smoothish bark, and silky shoots and young branches: lvs. oval, acuminate, acute at the base, 3-5 in. long, glabrous; petiole ¼ in., finely pubescent: fls. axillary, solitary or in clusters of 2 or 3 on very short peduncles bearing several short imbricated scale-like bracteoles; calyx-divisions small, broad, united half-way up, acute, pubescent; petals hairy, the outer ones linear, strap-shaped, acute, hollowed at the base; the inner a little shorter, thick, trigonous, expanded and hollowed at the base, covering the essential parts; stamens truncate; carpels 5, sunk in the center of the receptacle; ovules 4-6 in two rows: fruiting carpels 1-4 on very short thick stalks, broadly ovoid, 1-1½ in. long, containing several smooth brown oblong seeds.—This species is common in the moist low country near Colombo, Ceylon. Its bark, especially that of the root, its yellow fls., and the fr. are all delightfully sweet-scented and aromatic, and are chewed by the natives with their betel. The wood is

yellowish gray and soft. Two other Ceylon trees with fragrant yellow fls. are *X. nigricans*, with the calyx-divisions divided almost to the base; and *X. Chàm-pionii*, with blunt ovoid fl.-buds.

AAA. *African species.*

9. *æthiòpica*, A. Rich. (*Unòna æthiòpica*, Dunal. *Habzèlia æthiòpica*, A. DC.). GUINEA PEPPER. NEGRO PEPPER. HABB SELIM. GRAINS OF SELIM. AKOLA. BIKUÈ. A leafy tree of moderate height: lvs. coriaceous, glabrous and glossy above, finely appressed pilose beneath, oblong-elliptic or oblong, obtuse or narrowed at the base and more or less acuminate at the apex: fls. solitary or in clusters of several, short-pedicelled; calyx with the segms. broadly triangular and acute; petals on the outside fulvo-sericeous, linear, subconcave at the dilated base, the outer ones with thick margins, the inner ones narrower, triquetrous; stamens with the dilated connective puberulous, outer circle of stamens sterile, a little broader than the fertile ones; carpels numerous; ovules 6-8 in a single series; mature carpels subsessile, slender, cylindrical, somewhat incurved, about 2 in. long, slightly constricted between the seeds, glabrous, vermilion-colored within; seeds 6-8, of medium size, ellipsoid, about $\frac{1}{2}$ in. long and half as thick.—This species is endemic in W. Afr. where its fr. is used as a substitute for pepper. It was known to old authors under the name *Piper æthiopicum*. Closely allied to this species and similarly used are *X. niamniamensis* of Cent. Afr., formerly brought by caravan across the Sahara to the shores of the Medit., and *X. Eminii*, Engler, of the Uganda. So precious are these spices held, not only for seasoning food but for use as carminatives and stomachics, that in certain districts of Afr. they are circulated as money.

W. E. SAFFORD.

XYLÓSMA (Greek, *xylos*, wood, and *osme*, odor; alluding to the aromatic wood of some species). Syns., *Myróxylon*, *Hisingera*, *Flacourtiaceæ*. About 45 species

of evergreen, often spiny, trees or shrubs distributed throughout the tropical and subtropical regions of both hemispheres except Afr. Lvs. alternate, short-petioled, usually dentate, exstipulate: fls. small, in axillary racemes, usually dioecious, apetalous; sepals 4-5, slightly connate at the base; stamens many, distinct, surrounded by a disk; ovary superior, surrounded by a disk and sometimes by staminodes, 1-celled with several ovules; styles 2-3, usually connate. Little known in cult.; prop. by seeds and probably by cuttings of half-ripened wood under glass.

racemòsa, Miq. (*Hisingera racemòsa*, Sieb. & Zucc. *Myróxylon racemòsum*, Kuntze). TUNG-CHING TREE. Small tree or shrub, unarmed or spiny, glabrous: lvs. ovate, acuminate, rounded at the base, serrate, $1\frac{1}{2}$ -2 in. long: fls. yellow, fragrant, scarcely $\frac{1}{4}$ in. across, in axillary racemes $\frac{1}{2}$ -1 in. long: fr. globose, $\frac{1}{5}$ - $\frac{1}{4}$ in. thick, black, 2-3-seeded. Aug., Sept.; fr. in Nov., Dec. Japan, Korea, E. China. S.Z. 1:88. Var. *pubescens*, Rehd. & Wilson. Tree, to 80 ft.: branchlets pubescent: lvs. ovate to oblong-ovate, glabrous, $1\frac{1}{2}$ -3 in. long. Cent. and W. China.—Only this variety seems to be in cult. and Wilson pronounces it one of the handsomest evergreen trees of China; it has proved hardy in S. England and probably will do well in the southern states and Calif.

Sálmannii, Eichl. Shrub, to 15 ft., glabrous, the sts. and older branches armed with stout branched spines: lvs. chartaceous, ovate to ovate-oblong, obtuse or obtusely acuminate, cuneate at the base, crenate-dentate, $1\frac{1}{2}$ -4 in. long: fls. greenish yellow, fascicled; sepals ciliate; disk of the pistillate fl. annular; styles 2, 2-parted at the apex: fr. black, 3-4-seeded. Brazil, Argentina, Paraguay.

X. Aquifolium, Sprague. Lvs. holly-like or occasionally nearly entire, having pair of glands at base of blade, 2-4 in. long: racemes short, axillary, of very small fls.: styles 6-7. Habitat unknown, probably Polynesia or Austral.

ALFRED REHDER.

Y

YAM. The name yam properly belongs to the members of the genus *Dioscorea*, although unfortunately it has been applied for many years in the United States to the large varieties of the sweet potato, *Ipomœa Batatas*. The name as applied to the sweet potato is thought by some to be a corruption of an African word pronounced "nyam," brought by the negroes who were transported to America in the early days. This word was used for the true yam or other large roots or tubers used for food in Africa and was bestowed by the negroes on the large sweet potatoes in America.

The botany of the cultivated yams has not been cleared up. Many varieties are of mediocre quality, while some are excellent, being superior in flavor and mealiness to almost any other starchy vegetable. Single roots or tubers of some varieties, particularly of *D. alata*, attain great size, occasionally even reaching 100 pounds or more in weight, and several feet in length. The best varieties, however, are of small size, often less than a pound in weight. Among the best known of these are the yampis of Jamaica and the Isthmus of Panama, and other varieties of similar quality, such as the cush-cush of the Island of Trinidad. The Chinese yam or cinnamon vine, *D. Batatas*, is of excellent flavor, but on account of its deep-growing habit is very difficult to dig. Several kinds of yam are grown scatteringly in Florida. For further discussion, see *Dioscorea*.

ROBERT A. YOUNG.

YARROW: *Achillea*.

YELLOW-WOOD: *Cladrastis*.

YEW: *Taxus*.

YŪCCA (*Yucca*, native name for the manihot or cassava, erroneously applied to the present plants by Gerarde). *Liliaceæ*, tribe *Yuccææ*. Bold stiff-leaved plants suitable for lawn planting, subtropical massing, and a few of them for flower-garden use.

Acaulescent to arboreal endogens with fibrous evergreen sword-shaped lvs. usually pungent and often denticulate or fibrous on the margin: fls. white or shaded with cream or violet, cup- or saucer-shaped, usually pendent in large usually erect panicles, opening at night and then somewhat sickishly fragrant; pollination rarely occurs except through the aid of a small white moth, *Pronuba yuccasella*, found wherever yuccas occur wild on the continent, which deliberately gathers the pollen and thrusts it into the stigmatic chamber, its larvæ feeding exclusively on the maturing seeds of these plants: fr. either capsular or erect or fleshy and hanging in the principal groups or sub-

genera.—About 30 species, confined to N. Amer. and the W. Indies, most of them native to the arid S. W. U. S. and the Mexican tableland. A few species have been cult. for centuries, and within the last decade a large number of artificial hybrids have been produced and intro. into cult., especially along the Medit. There are recent monographs by the writer in Rep. Mo. Bot. Gard., Vol. 13, pp. 42-116, with illustrations, and by Molon in a small manual "le Yucche," Milano, 1914, in which many of the Sprenger hybrids are also figured. See *Hesperoyucca, Samuela*.

Propagation is by seeds, offsets, stem-cuttings or rhizome-cuttings. These should be planted in well-

4019. *Yucca glauca* in Colorado.

drained sandy loam, usually in the succulent house. The only species hardy where frost is severe are *Y. glauca*, *Y. filamentosa*, *Y. flaccida*, *Y. baccata*, *Y. recurvifolia*, and *Y. gloriosa*, which flower in the sequence given, the last-named often blossoming late in autumn. *Y. Treculeana* shows considerable resistance to frost. The tender species are kept in the cactus house. Well-drained sandy loam suits yuccas best, but with good drainage they are tolerant of a large range of soil and exposure. *Y. Treculeana* blooms usually in March in plant-houses, as when wild, and the Mexican species when brought to flower are usually spring bloomers, but they often refuse to flower for long periods and then suddenly and unexpectedly produce an abundance of simultaneous bloom, even on the smaller plants. Of the hardy species, *Y. glauca* flowers in June and it is quickly followed by *Y. filamentosa* and *Y. flaccida*, while the forms of *Y. gloriosa*, which usually flower only at intervals of several years, bloom from late August to so late in the autumn as to be cut down by frost. The only well-known yucca in northern gardens

is the common Adam's needle, *Y. flaccida*. This persists for years, sending up a tall panicle of cream-white flowers in late spring or early summer. All yuccas are suited to bold and formal effects in gardening; as tub specimens they may be used effectively in subtropical bedding or massing.

Most yuccas may be fertilized if fresh pollen is transferred directly from the anther to the stigmatic cavity

of a newly opened flower, preferably one seated directly on the main shaft, where nutrition is more certain. *Y. aloifolia* commonly fruits freely, but the others rarely fruit spontaneously in cultivation except *Y. filamentosa* and *Y. flaccida*, which are pollinated by the small white moth (*Pronuba yucca-sella*) that accompanies them when cultivated in the western states, but emerges from the pupa too late to pollinate *Y. glauca* and disappears too early for *Y. gloriosa*. See Rep. Mo. Bot. Gard. 3:99; 4:181, for additional discussion.

4020. *Yucca radiosa*.

The great yuccas, or "yucca palms," of southern California are chiefly *Y. arborescens*. They grow in the higher lands bordering the Mojave and adjacent deserts, reaching a height of 15 to 20 feet. The old plants are exceedingly weird and picturesque. Occasionally this species is transferred to gardens, but it is apparently not in the trade. This "Joshua tree" is now separated as *Clistoyucca arborescens*, Trelease; as it is not in cultivation, it need not be discussed further here except to say that *Clistoyucca* differs from *Yucca* in its very short style, fleshy incurved perianth, and spongy dry indehiscent fruit.

WILLIAM TRELEASE.

4023. *Yucca Treculeana*.

Z

ZALÁCCA (said to be the name of the genus in the Moluccas). *Palmaceæ*. Stemless palms with creeping roots, adapted to the warmhouse. Lvs. elongated, equally pinnatisect; segms. alternate, fascicled or equidistant, lanceolate or oblanceolate, straight or falcate, acuminate; rachis obtusely 3-angled, not produced into a spine; petioles rather terete, usually with spirally disposed prickles; sheaths strongly armed with compressed prickles; ligule none; spathes persistent, the lower ones sheathing the peduncle and branches, incomplete, the partial ones subtending the floriferous branchlets; spadices simple or fastigiately branched, pendulous, floriferous branchlets catkin-like, rather short, remote or clustered, sessile or pendulous: fls. polygamous-dioecious, usually rose-colored: fr. globose, turbinate or ovoid, 1-3-seeded, usually beaked.—About 14 species, Assam and Malay. Two forms have been sometimes cult. *Z. edulis*, Blume (*Z. Blumiana*, Mart.). Lvs. copious, clustered, erect, clothed with long, often serrate prickles; pinnae linear-lanceolate, very long-acuminate, $1\frac{1}{2}$ – $2\frac{1}{4}$ ft. long, $1\frac{1}{2}$ –2 in. broad, whitish beneath; petiole rather shorter than the rachis and armed with robust prickles: spadices drooping, long-branched: fr. fulvous-fuscescent, pyriform, $2\frac{1}{2}$ in. long. Malay Archipelago. Var. *Wallichiana*, Mart. (*Z. Wallichiana*, Mart.), has lvs. 18–20 ft. long, clustered, nearly erect; pinnae fascicled in 2's, 3's, or 4's, narrow-lanceolate, with a long and slender, cuspidate point, attenuated and reduplicate at base, flat, older ones $1\frac{1}{2}$ ft. long, 3–4 in. broad; petiole 4–6 ft. long, armed with robust, fuscous prickles: fr. ovate-pyriform, $1\frac{1}{2}$ ft. long. India, Burma, and Malaya. G.C. 1873:1083.

F. TRACY HUBBARD.

ZALUZÂNIA (named for the Pole, Adam Zaluziansky von Zaluzian). *Compositæ*. Hoary-tomentose or scabrous-pubescent shrubs or subshrubs: lvs. alternate, entire, dentate, lobed or many-cut: heads pedicelled, heterogamous, arranged in corymbose leafy panicles: ray-fls. in 1 row, pistillate; disk-fls. perfect and fertile; involucre broadly campanulate; corolla yellow or perhaps white.—About 12 species, Mex. Apparently none in cult.

ZALUZÍANSKYA (after Zaluziansky, as indicated above, who wrote *Methodus Herbariarum*, Prague, 1592). Including *Nycterinia*. *Scrophulariaceæ*. More or less viscous annual or perennial garden herbs, also grown in the greenhouse.

Leaves, lowest opposite, upper alternate, usually few-toothed; floral lvs. smaller, bract-like, entire; fls. sessile, usually arranged in dense or interrupted terminal spikes; calyx ovate-tubular, shortly 5-toothed, 2-lipped or 2-parted; corolla persistent, tube elongated, finally split to the base; limb 5-lobed, entire or 2-cleft; stamens usually 4: caps. oblong, leathery or membranaceous, septicidally dehiscent.—About 36 species, natives of S. Afr. All the species mentioned here have their corolla lobes bifid.

Three of the species are known as night balsams or star balsams, from their night-blooming habit. The name night-blooming phlox would be better, as the flowers are salver-shaped and five-lobed, each lobe being deeply cut. These plants are generally treated as half-hardy annuals, the seed being sown indoors in early spring. The plants bloom in about ten weeks after being set out and continue in flower through July and August. Some cultivators declare that this method is very unsatisfactory and urge that the seed be sown in the autumn and the young plants wintered in a coldframe. They will then begin to flower by June. The blossoms are closed by day and are fragrant by night.

A. Corolla-tube slightly pubescent.

B. Duration perennial: bracts broadly lanceolate: lvs. oblong-linear.

lychnidea, Walp. (*Nycterinia lychnidea*, D. Don. *Erinus lychnidea*, Linn. *E. gracilis*, Lehm., not Hort.). Subshrub, about 2 ft. high: lvs. oblong-linear, sessile, entire or few-toothed: corolla-tube $1\frac{1}{2}$ in. long, limb $\frac{1}{2}$ – $\frac{3}{4}$ in. across, white inside, purplish or red outside. B.M. 2504; 8215 (the latter as *Z. maritima*). B.R. 748. G.C. III. 42:162 (as *Z. maritima*).—Usually acts much like an annual and is generally treated as such when cult.

BB. Duration annual: bracts oblong-lanceolate: lvs. linear or the lower ones lanceolate.

capensis, Walp. (*Nycterinia capensis*, Benth.). Differs from the above, as described by Benthams, in stature, duration, strict sts. and smaller lvs., but unfortunately Benthams does not give the height of the plant or color of the fls. According to R.H. 1851:221, the plant has white or lilac fl.-clusters on the same plant, each fl. having an orange eye. The spikes, according to Benthams, are commonly short and 4–8-fld., sometimes long and 15–20-fld. There is some evidence that this species and the next are confused in the trade. In R.H. 1851:221 the fls. are $\frac{3}{4}$ –1 in. long and less than $\frac{1}{2}$ in. across.

AA. Corolla-tube glabrous.

selaginoides, Walp. (*Nycterinia selaginoides*, Benth.). Dwarf annual, branched at the base, 3–5 in. high, rarely 6 in., with spatulate lvs. and fls. $\frac{3}{4}$ –1 in. long, color of fls. not stated by Benthams, but in R.H. 1896, p. 308 (same picture as Gn. 24, p. 89) the fls. are said

to range from white to lilac and darker depending on their stage of development, with an orange-colored eye which becomes crimson later. This suggests the preceding species, and it is evident that the two must be distinguished by technical characters until the colors can be verified. G.C. III. 55:173.—The plant once advertised in America as *Nycterinia selaginoides* is said to be a pink-fld. half-hardy perennial, growing 9 in. high, which does not agree with authentic descriptions. A species passing under this name is hardy at San Francisco.

WILHELM MILLER.

F. TRACY HUBBARD.†

4024. Leaf of *Zamia floridana*.

ZAMIA (name used by Pliny, meaning *loss* or *damage*, and first applied to barren pine cones, and transferred to these plants apparently because of the cone-like fruit). *Cycadaceæ*. Perennial, tropical and subtropical plants, resembling palms and in some respects ferns.

Caudex sometimes a low trunk, simply lobed or branched, standing above or almost below ground: lvs. few, developing one after the other, pinnately compound; pinnæ broad or narrow, articulate at base, entire or serrate, parallel-veined; petiole smooth or spinulose: cones rather small for the order, glabrous or rarely scurfy: fls. dioecious, male cone oblong-cylindrical, female cone similar but larger and thicker: ovules sessile, ovoid.—About 36 species, Trop. and Subtrop. Amer. One of the 9 genera of the Cycas family, as constituted by Alphonse De Candolle (Prodr. 16, pt. 2, pp. 522-47). Other genera of horticultural interest and discussed in this Cyclopaedia are *Ceratozamia*, *Cycas*, *Dioon*, *Encephalartos*, and *Macrozamia*. The fls. of cycads are dioecious, without envelopes; the pistillate fls. are mere naked ovules inserted under scales in cones, and the staminate fls. are simple anthers under similar scales. The plants are therefore gymnosperms (seeds naked or not inclosed in a pericarp or ripened ovary) and are allied to the conifers. The fr. is a berry-like drupe. In *Zamia* the floral scales are peltate (and not horned) and form a cylindrical cone; the anthers are numerous, and the ovules pendulous in pairs. The fecundation of *Zamia* has been studied by H. J. Webber (Bull. No. 2, Bur. Pl. Ind., U. S. Dept. Agric.). His conclusions respecting the Floridian species are accepted below.

The *zamia*s are stocky short- and usually simple-stemmed cycas-like plants, the trunk sometimes subterranean, with long-pinnate evergreen leaves or fronds, the leaflets being thickened and usually broadened at the base, and jointed. *Zamia*s are warmhouse plants, to be treated like species of *Cycas* or *Encephalartos*, which see. The plants are propagated by means of seeds and offsets; also by division when there is more than one crown.

A. Petiole prickly.

furfuracea, Ait. Trunk cylindrical, 1-2 ft. tall: petioles dilated and concave at the base, with several small prickles; lfts. about 10-12 pairs, opposite or alternate, oblanceolate, entire on the lower half but serrate or jagged toward the top, acute or obtuse, scurfy beneath (as also the rachis): cone oval-conical, downy, pedunculate, pale yellowish brown, the pistillate ones 4 in. or less long. Mex. B.M. 1969.

Lindenii, Regel. Trunk cylindrical, 2-4 ft. or more tall when well grown: petioles long, cylindrical, sparsely provided with tawny wool, the prickles short-conical and spreading; lfts. 20 or more pairs, glabrous or somewhat puberulous, nearly or quite opposite, sessile, long-lanceolate and acuminate, dentate-serrate toward the top. Ecuador. I.H. 22:195.

AA. Petiole not prickly.

B. Species growing beyond the limits of the U. S.

integrifolia, Ait. Trunk 12-18 in. tall, erect, globular or oblong; lvs. glabrous; lfts. alternate, 7-16 pairs, oblong to linear-lanceolate to lanceolate, mostly obtuse, entire or somewhat dentate toward the apex: cones oblong and

4025.
Staminate
cone of *Zamia
floridana*.

4026.
Pistillate cone of
Zamia floridana.

obtuse, short-peduncled. W. Indies. B.M. 1851.—The Fla. plants, sometimes referred here, are apparently all *Z. floridana* and *Z. pumila*.

mexicana, Miq. Distinguished by DeCandolle as follows: scales of the lf.-buds tomentose and also the petioles at the base, the petioles 3-cornered, unarmed, glabrous, somewhat warty: lfts. of 9 or more pairs, subopposite, narrow-lanceolate, straight or slightly curved, acute or acutish, rigidly coriaceous, dark green, many-nerved, spinulose-serrulate from the middle to the apex. Mex.—By Index Kewensis referred to *Z. Loddigesii*, a species with prickly petioles.

pseudo-parasitica, Yates (*Z. Roëzii*, Regel). Distinguished as follows by DeCandolle: trunk cylindrical: lfts. lanceolate, sinuose-falcate, entire, glabrous, acute at the base, cuspidate at the apex, with 18 strong nerves which are twice bifurcate. Panama.—Grows on tree trunks.

angustifolia, Jacq. Foliage glabrous when mature; lfts. 5 in. long, 4-20 pairs, usually alternate, elongated and narrowly linear, the apex obtuse and very obscurely serrulate or entire, the base not narrowed, 6-8-nerved: pistillate cone obtuse but cuspidate. Bahamas, Cuba.

BB. Species native to Fla.

floridana, DC. COONTIE. COMPTIE. Figs. 4024-4027. Lvs. ovate or ovate-lanceolate; petiole triangular in outline, sericeo-tomentose at base, with scattered hairs above; lfts. mostly opposite, 14-20 pairs, glabrous above and with scattered hairs beneath, linear, falcate and somewhat twisted, narrowed at the base and obtuse at the apex, the margin revolute and with a few obscure teeth: mature pistillate cones oblong, 5-6 in. (12-16½ cm.) long, markedly umbonate (projection on the scales), densely tomentose.—Abundant in S. Fla. on the east coast below latitude 26° 30', in open comparatively dry pine woods.

pumila, Linn. Differs, according to Webber, in having shorter and broader lfts. which are less twisted and not so erect and rigid, and in its shorter and non-umbonate cones with seed-bearing scales thinner and more flattened at outer end.—Abundant in Cent. Fla., ranging from 28° 30' north for 1° of latitude, in dense moist woods.

Z. corallipes, Versch., is *Macrozamia spiralis*.—*Z. Denisoi*, Auth., is *Macrozamia Peroffskyana*.—*Z. glauca*, Hort.—*Cycas Rumphii*(?).—*Z. pungens*, Ait.—*Encephalartos pungens*.—*Z. spinosa*, Lodd.—*Encephalartos Altensteinii*.

L. H. B.

ZAMIOCULCAS (*Zamia* and *Culcas*). *Araceæ*.

One species, sometimes grown in the warmhouse for ornament and curiosity, it being one of the very few aroids with pinnate lvs. *Z. zamiifolia*, Engler (*Z. Loddigesii*, Schott. *Caladium zamiaefolium*, Lodd.), grows in Trop. Afr. It is an evergreen perennial herb, with stout creeping rootstock, and erect glabrous radical lvs. standing 1½-2 ft. high: lfts. about 12, opposite or alternate, oblanceolate, acute, jointed to the petiole and forming small tubers at the base after falling: spathe convolute at base with spreading or reflexed blade, green, glabrous; spadix club-shaped, with female fls. below and male fls. on the longer upward part, whitish, about 1-1½ in. long and ½ in. thick. B.M. 5985. L.B.C. 15:1408. Prop. by the lf.-tubers and by division.

4027. Aggregate fruit of *Zamia
floridana*. Cone not mature.
(×½)

ZANNICHELLIA (named in honor of G. G. Zannichelli, a Venetian botanist). *Naiadaceæ*. **HORNED PONDWEED**. Slender branching herbs, growing under water, of little horticultural value for ponds: lvs. mostly opposite, long and linear, thread-like, entire; stipules membranous, sheathing: fls. monœcious, sessile, naked, usually both kinds from the same axil. About 5 species, scattered throughout the world. *Z. palustris*, Linn. Style at least half as long as the fr., which is flattish, somewhat incurved, even, or occasionally more or less toothed on the back (not wing-margined), nearly sessile. Cosmopolitan in fresh or brackish water.

ZANÒNIA (Jacob Zanoni, 1615-1682, botanist of Bologna). *Cucurbitaceæ*. Under this genus, one species, *Z. sarcophylla*, Wall., is sometimes listed among cult. plants. This plant is now placed in the genus *Alsomitra* and becomes *A. sarcophylla*, Hook. f. It is native of Burma: climbing shrub with very fleshy 3-foliate lvs.; lfts. oblong, entire: fls. small, white, diœcious, in compound panicles; corolla rotate, 5-parted, with obtuse segms.; calyx rotate and 5-parted, with acute segms.; male fls. with 5 stamens; females with a 1-celled elongate 3-4-styled ovary: fr. a medium-sized 3-valved caps.; seeds black, narrowed at base, with 2 flat curved horns at apex.

ZANTEDÉSCHIA (Francesco Zantedeschi, wrote on Italian plants in 1825). Syn., *Richardia*. *Araceæ*. **CALLA** of horticulturists. Perennial herbs grown for their ornamental corolla-like spathes and sometimes for spotted foliage; greenhouse subjects in the northern regions, but grown permanently in the open in California and other warm parts. The genus comprises the "calla lily."

Herbaceous plants with many long-petioled lvs., all from a thick rhizome: peduncles appearing with the lvs.: petioles spongy, often bristly below; blade sagittate, hastate, or lanceolate to cordate-ovate, the numerous primary and secondary nerves excurrent: peduncle as long or longer than the lvs.; spathe large, open, with a flaring, pointed, recurved tip; spadix staminate above, and pistillate below (Fig. 4029): fls. many and small, naked, crowded, staminodes sometimes mixed with the ovaries: fr. a 1-3-celled berry.—Engler admits 8 species in his latest monograph (*Das Pflanzenreich*, hft. 64, 1915), in Trop. and S. Afr. The common calla-lily was long known in commerce as *Calla æthiopica*. Later it was known as *Richardia africana*, it having been found that the genus *Calla*, as more closely defined, could not include it. The *Richardia* of Kunth, 1818, under which the plant has been named, is antedated by another *Richardia*, and *Zantedeschia*, 1826, is considered by latest authorities to be the tenable name and is retained in the "nomina conservanda" of the International Rules as against both *Richardia* and *Aroides*. The genus *Calla*, as understood by modern botanists, comprises a single species, *C. palustris*, native in swamps in the northern hemisphere, including N. E. U. S. and Canada; see Fig. 742, Vol. II. For the black calla, see *Arum*.

When grown for the flowers only, zantedeschias may be planted out permanently on a bench, using very rich soil and giving an abundance of water while growing. They may be kept growing continually or given a season of rest, as desired. Plants in pots are usually started late in summer from dry tubers. The species having yellow and pink spathes seem to do best when grown without a resting-period.

Culture of callas. (T. D. Hatfield.)

The so-called calla of gardens (*Zantedeschia æthiopica*) has been a favorite for generations. Although often grown as a window-plant, it is very unsuitable and seldom blooms under house treatment. When grown for

winter flowers, it is customary to give the roots a rest during summer-time. They may be dried and stored if necessary. It is in this condition that Californian callas are received. It is the opinion of the writer that summer-resting would be the best treatment for those grown as house-plants, as well-grown dried roots are more likely to bloom. But rest must be enforced, for callas will grow all the year round, increasing in size and numbers when planted out. The largest blooms are always secured from summer-grown plants. They are taken up in the autumn, given good loam and plenty of root-room, with a liberal allowance of liquid fertilizer when well established. They thrive best under good light, and in a minimum temperature of 55°.

There are several varieties, all differing only in size, from those which grow 6 feet to "Little Gem"—1 foot. Some are said to be more odorous than others, although all are fragrant. Besides being invaluable pot-plants, they can be used with good effect in indoor water-gardens, growing luxuriantly when partly submerged; and also in bog-gardens, and on the margins of ponds, to give sub-tropical effects.

Although introduced to cultivation about twenty-five years ago, *Z. Elliottiana* is yet of secondary importance, although an acqui-

4028. *Zantedeschia albo-maculata*. ($\times \frac{1}{2}$)

sition. It is a South African species, about which comparatively little is known in the wild. (N. E. Brown writes in "Flora of Tropical Africa," Vol. 8, 1902: "This species is stated to have been raised from seeds received from South Africa, but I have reason to believe that its habitat is somewhere in the northern part of the Transvaal." The plant was described as *Richardia Elliottiana* in Garden and Forest, New York, 1892.) When introduced, it was thought difficult to grow. It was first grown in this country by William Robinson, gardener to F. L. Ames, North Easton, Massachusetts, Mr. Harris, gardener to H. H. Hunnewell, Wellesley, Massachusetts, and Joseph Tailby, of Wellesley. The last named is a commercial grower, who looked on his importation as an investment. The bulbs (corms or roots) were expensive—a guinea or thereabouts—and about as big as marbles. Tailby's experience is interesting and it may be valuable to the reader. He came near losing his whole stock by cutting out the eyes, with the object of getting separate plants. There had been no sign of natural division, nor has there since; although some are still of the opinion that by proper manipulation they may be increased by division, as we now do potatoes, but the wounds must be given time to heal over. The roots are kept over in a cellar at a temperature of 45° F., or thereabouts, until

April, when they will show signs of starting. They should be potted then, but kept rather dry until the roots develop. The pots will be fairly well filled with roots before much growth shows, and they can be kept under benches in a coolhouse, or even in the cellar, for two weeks after potting. With the roots well started,

4029. Common calla lily.—*Zantedeschia aethiopica*. Left-hand specimen shows the spadix, the spathe being removed. ($\times \frac{1}{2}$)

best attention. They usually do not become thoroughly ripened until August. Pot-grown plants are better stored in pots. The whole culture is easy when it is known.

Seeds of *Z. Elliottiana* sown in November usually come up strong, but the plantlets are difficult to handle and liable to go off when very young. It is the safest way to let them stay in the seed-boxes, ripen there, and plant them farther apart next season. Seeds have been sown outdoors with very gratifying results. Almost a year is gained in this way, as the roots (or bulbs) are considerably larger than box-grown seedlings. Older roots held over until settled weather and planted like potatoes bloomed freely all summer, making fine roots; they were green when cut by frost in October, but ripened seeds. To do this successfully takes a longer season, and the plants must be started indoors.

The calla in California. (Ernest Brauntun.)

In considering the calla in California, it is necessary to treat it under two general heads: first, as an ornament; and second, as an article of commerce. The popular and growing demand for calla bulbs (or tubers) speaks much for the plant as an ornamental. Many, indeed, are the uses to which it is put. It is, perhaps, most commonly used as a belt along fences, and not infrequently as a hedge between two properties; or nearly as often is found along one side of a house in a long narrow bed. For effective planting it is much in demand for grouping around hydrants and unsightly objects in damp places, at watersides; sometimes as a border around a fish- or lily-pond, oftentimes growing in bunches or masses in the water itself; or massed on a slope near water; mixed with other tropical vegetation; or as a border to tropical jungles; and very effective, indeed, is it in the lower tiers of basins around a large fountain with myriophyllum hanging down from the base of the callas. For all of these purposes the foliage is of even more importance than the flowers. As it grows luxuriantly here in almost any location, it is very seldom seen as a pot-plant either in the dwelling or on sale at the nurseries. In the most favored places only is it entirely secure from the frost, although the damage to it from this source is not serious in or around Los Angeles. Although doing fairly well in the full sun, our summer climate is too dry for it to attain its greatest

beauty and luxuriance wholly without protection, and it may therefore be seen in perfection only when grown in partial shade. A good supply of water and manure is also an important factor in its proper development.

The spathe is subject to many variations in form, both in size and shape, some being long, rather narrow and pointed, ending in a decidedly recurved awn, while others are nearly circular, with the sharp point almost wanting and standing upright the same as the remainder of spathe. It frequently happens that the spathe is double and even triple, sometimes in its entirety but often only partially so. In the latter case it often assumes some very strange forms. The spadix is not so variable and seldom departs from the type, although an occasional double or abnormal spadix is found. Most other species or varieties than *Z. aethiopica* are found but sparsely in California gardens, the most common ones being the spotted-leaved and the dwarf form known as the Little Gem, but *Z. Elliottiana* is grown extensively in certain areas, especially about Santa Cruz, which is the center of the bulb-growing industry in California.

Commercially, the growing of the bulbs for eastern and foreign markets is a sure source of revenue, and is conducted extensively throughout southern California. The local market for the so-called flowers is of course limited, but if grown in a practically frostless belt, the blooms will more than pay for the cultivation of the winter field, as in that season of the year flowers of all kinds are scarce. The average retail price for good blooms in midwinter is 50 cents a dozen; the wholesale price about \$1 a 100. Bulbs at retail cost about one-half, or even less, what they do in the East. The commercial growers get at present (January, 1916), \$25 to \$60 a 1,000, according to size, the market calling for tubers $1\frac{1}{2}$ to 3 inches in diameter. Larger sizes are quoted as "fancy" and command extra prices. Although they can be grown in almost any soil with some success, a free cool blackish loam is best, and they do not thrive in a hot gravelly or stony soil. The lands near the coast, where swept by the cooling sea-breeze, are productive of the best results, both in bloom and tuber. Land containing sufficient alkali to prevent the growth of many common crops will produce good callas if other requirements are present. In field-planting it is much better to put in small bulbs about 4 inches apart than to sow the offsets promiscuously in the row; when the sets are thus sown, they should be taken up the following year and the small bulbs properly planted. Offsets sown as above and left four to six years (the usual time for a good crop) have never produced satisfactory results. No pest seriously attacks foliage or bloom, but in dry years more especially, the common sow-bug eats into the tubers very seriously and receives considerable assistance from millipedes. Both these pests are a considerable nuisance to the California nurseryman and gardener.

4030. Calla with double spathe.—*Z. aethiopica*.

A. *Lvs. lanceolate.*

1. *Réhmnnii*, Engler (*Richárdia Réhmnnii*, N. E. Br.). PINK or ROSE CALLA. Dwarf perennial: lvs. lanceolate to long-lanceolate, unequal-sided, light green and white-pellucid-dotted, petioled, equaling or exceeding the peduncle and spathe, the petiole without bristles: spathes about 4 in. long, erect, trumpet-shaped, with a caudate tip 1 in. long; fr. an obovoid or depressed obtuse 1-2-celled berry. B.M. 7436.—In Natal, where it is native, the spathes are said to be dull rose without, rose-purple within, with a dark crimson blotch at the base inside. In cult. the spathes are white, with a faint rose tinge to the back and margins. Var. *speciösa*, Hort., is dwarfer and more robust than the type.

AA. *Lvs. sagittate or cordate.*B. *Foliage spotted.*

2. *álbo-maculàta*, Baill. (*Richárdia álbo-maculàta*, Hook. f.). SPOTTED CALLA. Fig. 4028. Petiole short, without bristles; blade 12-18 in. long, white-spotted all over, hastate, 3-4 times longer than broad, acute, the basal lobes widely spreading, triangular, obtuse or acute, 3-4 in. long; spathe trumpet-shaped, 4-5 in. long, 2 in. wide, dull creamy yellow or milk-white with a blotch of crimson at the base. S. Afr. B.M. 5140. I.H. 7:255. F.S. 21:2258.—Will stand in the open in frosty regions with good protection for the roots. Not of much value except in botanical collections.

3. *Nélsonii*, Hort. Allied to *Z. albo-maculata*: very vigorous and floriferous, reaching 3-4 ft., the scape overtopping the foliage: lvs. sagittate, bright green, sprinkled with pellucid dots or spots, as in *Z. Elliottiana*: spathe scarcely spreading, the limb short, very pale yellow with a purple blotch at the bottom.—Not recognized by monographers, and perhaps a synonym or a form of some other species. In S. Calif. blooms only in summer, after *Z. Elliottiana* is past.

4. *melanoleuca*, Engler (*Richárdia melanoleuca*, Hook. f. *R. Spréngeri*, Comes). BLACK-THROATED CALLA. Scape and petioles bristly below: lvs. 6-12 in. long, hastate-ovate-acuminate, the basal lobes obtuse, marked all over with oblong, white, translucent spots: spathe pale straw-colored, widely flaring and open from the base, the margins and cuspidate tip recurving, with an ample black-purple spot at the base within. Natal, 1868. B. M. 5765. Var. *tropicalis*, Engler (*Richárdia melanoleuca* var. *tropicalis*, N. E. Br.), of Trop. Afr., differs in larger size and absence of bristles at base of petiole.

4031. *Zantedeschia aethiopica* var. *minor*, Little Gem. (× ¼)

5. *Elliottiana*, Engler (*Calla Elliottiana*, Knight. *Richárdia Elliottiana*, W. Wats.). GOLDEN CALLA. Lvs. glabrous; petiole 2 ft. or more long, lacking bristles, more or less mottled; blade ovate or orbicular-ovate, cordate at base, obtuse but subulate-pointed at apex, light green, with a few white or translucent spots, with undulate margins, about as large as those of *Z. aethiopica*: spathe a rich lustrous yellow, lasting about two weeks, becoming greenish with age, not purple-blotched, about 6 in. long; berries about ¾ in. diam., nearly globose, green: tuber proliferous. Afr., probably in Trop. Transvaal. B.M. 7577. Gn. 46:446. Gn. W. 11:553. R.H. 1904:136.

BB. *Foliage without spots.*c. *Base of the lf.-blade cordate.*

6. *æthiöpicä*, Spreng. (*Calla æthiöpicä*, Linn. *Colocasia æthiöpicä*, Spreng. *Richárdia æthiöpicä*, Hort. *R. africàna*, Kunth). COMMON CALLA. LILY-OF-THE-NILE. Fig. 4029. Stout robust plant: lvs. smooth, the petiole without bristles; blade about twice as long as wide, broad or narrow but cuspidate at the apex, cordate-sagittate at the base, both lvs. and spathes varying greatly in size: spathe 3-10 in. long, white, creamy inside at the base, flaring outward and narrowing to a cuspidate tip. S. Afr. B.M. 832. Gn. 33:584. Gn. W. 21:73.—Fragrant. Sports with double and triple spathes often occur. A.F. 5:83. Gn. 46, p. 447. See Fig. 4030.

Var. *minor*, Engler (*R. nàna compàcta*, Hort.). LITTLE GEM. Fig. 4031. Like the type, but only 12-16 in. high: spathes 3-4 in. long. Var. *devoniënsis*, Hort. (*R. devoniënsis*, Hort.). Dwarf; freer bloomer than Little Gem, and more fragrant.

There are many forms of the calla lily in cult., a number of which have received Latin names. Some of these horticultural names are *candidissima*, spathe large, pure white; *gigantëa*, plant very large; *Godefroyana*, dwarf, white; *grandiflora*, spathe large; *Childsiana*, dwarfer and more compact than type and more floriferous.

7. *macrocarpa*, Engler (*Richárdia macrocarpa*, W. Wats. *R. Pentlandii*, Whyte. *Calla Pentlandii*, Whyte. *Z. Pentlandii*, Hort.). Erect perennial: lvs. ovate-cordate, acuminate-caudate, with an open sinus, basal lobes rounded; midrib thick: spathe golden yellow, broadly trumpet-shaped, its lower margins convolute one-third, flaring above, the subulate tip abruptly recurved, margins recurved, slightly warty and with a black-purple blotch at the base within. Basuto-land, S. Afr. B.M. 7397.—Hooker writes (in B.M. 7397) that "*R. Pentlandii* is much the largest-leaved species, and is the only one with a deeply gamboge yellow spathe within, which is much the largest and broadest of any." First flowered in 1892 by R. Whyte, Pentland House (Lee, England).

cc. *Base of the lf.-blade hastate.*

8. *oculàta*, Engler (*Calla oculàta*, Lindl. *Richárdia hastàta*, Hook. f. *Z. hastàta*, Engl. *R. Lütwychei*, N. E. Br. *Z. Lütwychei*, Dur. & Schinz.). PRIDE OF THE CONGO. YELLOW CALLA. Petioles 12-18 in. long, usually or always bristly below; blades dull green, hastate-ovate, twice longer than wide, rather flaccid, 8-16 in. long, cuspidate at the apex, basal lobes separated by a narrow sinus or overlapping and very obtuse: spathe cup-shaped, 4-5 in. long (with a tail 1 in. long), greenish yellow, the tip erect, black-purple at the base within, the lateral nerves usually rather prominent above. Cent. and S. Afr. B.M. 5176. Gn. 18:596.

Most of the garden forms have been named under *Richardia* rather than under *Zantedeschia*; in the following list R=the former and Z the latter.—*R. Adamii*, Hort. Leichtlin. Strong-growing, with lvs. sagittate, bright green, and somewhat exceeding the scape: spathe short and rather open, creamy white with a black or purple throat. Trop. Afr. Distributed by Max Leichtlin (Germany) in 1898. There are hybrids of this and *Z. Elliottiana*.—*Z. angustiloba*, Engler (*R. angustiloba*, Schott. *Z. chloroleuca*, Engler & Gilg). Lvs. glabrous, without spots, the petiole without bristles; blade hastate, narrow, the basal lobes one-fourth the length of the apical one, 20 in. long, 3 in. wide at the base; peduncle 4-4½ ft. long; spathe about 4 in. long, sulfur-yellow, red inside at base. Angola.—*R. auràta*, Hort., said to be a hybrid of *Z. albo-maculata* × *Z. hastata* (*oculata*); lvs. spotted; spathes large, yellow.—*R. cantabrigiënsis*, Lynch=Z. *Elliottiana* × *R. aurata* or *Z. Réhmnnii* × *Z. Elliottiana*.—*R. intermèdia*, Hort. Very free-flowering: lf.-stalks bright green, marbled with white and rose: spathe very dark yellow, with small black blotch at the base.—*R. Lathamiana*, Hort.=Z. *Elliottiana* × *Z. albo-maculata*.—*R. suffusa*. A distinct dwarf-habited plant with a creamy white spathe, the base in the inside of a rich violet-purple shade. It is apparently a plant of good constitution." Gn. 55, p. 317, note.—*R. Taylors*, Hort., is *Z. Elliottiana* × *R. aurata*.

JARED G. SMITH.
L. H. B.†

ZANTHORHIZA (Greek, *yellow root*). Often spelled *Xanthorrhiza*. *Ranunculaceæ*. Shrubby plants cultivated mostly for their handsome foliage, which is much like that of *Actæa*, and which changes to a beautiful golden color in the autumn.

Leaves pinnate or bipinnate: fls. in drooping racemes or panicles; sepals 5, petal-like, deciduous; petals 5, smaller than the sepals, and 2-lobed; stamens 5-10;

4032. *Zanthorhiza apiifolia*. ($\times \frac{1}{2}$)

carpels 10, sessile, forming only 1-seeded follicles, 1 ovule of each usually not maturing.—One species, *E. U. S.* from N. Y. to Fla.

The plants will grow readily in any good soil but usually prefer damp and shady places, although they often thrive in loose sandy soil. Propagated both by seed and root-division in autumn or early spring. The seeds should be sown in a well-prepared seed-bed as the young seedlings are rather delicate. If sown in early autumn they may be given partial shade to advantage. Old plants when divided are easily grown, and for this reason root-division is often preferred. Often not hardy in Massachusetts and extreme northern states.

apiifolia, L'Her. SHRUB YELLOW-ROOT. Fig. 4032. Sts. of bright yellow wood, 1-20 ft. high: roots yellow, sending up suckers in spring: lvs. in clusters from terminal buds; lfts. about 5, cut-toothed or lobed, with wedge-shaped bases and entire sinuses: fls. small, dark or purple. April. Damp and shady places. A.G. 12: 289. Var. *ternata*, Huth. Lvs. only ternate; lfts. often more deeply lobed, the sinuses entire. Same distribution.

K. C. DAVIS.

ZANTHOXYLUM (Greek, *xanthos*, yellow, and *xylon*, wood). Also spelled *Xanthoxylum*. Including *Fagara*. *Rutacæ*. Ornamental woody plants chiefly planted for their handsome foliage and for their ornamental fruits.

Deciduous or evergreen shrubs, sometimes sarmetose, or trees, with usually prickly branches; most parts, particularly the frs., emitting a strong aromatic odor when bruised: lvs. alternate, odd-pinnate, 3-foliolate or rarely simple: fls. dioecious or polygamous, small, in cymes or panicles; sepals, petals, and stamens 3-8, sepals often wanting; pistils 3-5: fr. composed of 1-5 separate small dehiscent caps., each with 1-2 shining black seeds.—The genus contains about 150 species in

the tropical and subtropical regions of both hemispheres, and a few in temperate regions. Several species are used medicinally. The wood of some W. Indian species and that of the Australian *Z. brachyacanthum* is considered valuable. The frs. of *Z. piperitum* are used like pepper in Japan.

The zanthoxylums in cultivation are prickly shrubs or rarely small trees with mostly deciduous odd-pinnate, medium-sized or rather small foliage and small greenish or whitish flowers in small, rarely large, axillary or terminal clusters, followed by usually reddish small pods disclosing lustrous black seeds at maturity. *Z. americanum* is the only species which is hardy North, while the species from eastern Asia, as *Z. schinifolium*, *Z. Bungei*, and *Z. alatum* var. *planispinum*, have proved fairly hardy in favorable positions as far north as Massachusetts, the first being the hardiest, but they probably will be perfectly hardy in the Middle Atlantic states. They do not seem to be particular as to the soil, but grow best in a well-drained soil and sunny position. Propagation is by seeds and by suckers or root-cuttings.

A. *Rachis not or very narrowly winged.*

B. *Fls. before the lvs., in axillary fascicles.*

americanum, Mill. (*Z. fraxineum*, Willd. *Z. rami-florum*, Michx.). PRICKLY ASH. Fig. 4033. Shrub or small tree, attaining 25 ft., with prickly branches: lfts. 5-11, opposite, almost sessile, ovate, entire or crenulate, dark green above, lighter and pubescent beneath, $1\frac{1}{2}$ -2 in. long: fls. small, greenish, in axillary sessile clusters, appearing shortly before the lvs.: seeds black. Que. to Neb. and Va. B.B. (ed. 2) 2:444.

BB. *Fls. after the lvs., in terminal corymbs.*

c. *Prickles solitary.*

schinifolium, Sieb. & Zucc. Shrub or small tree, to 20 ft.: lvs. 3-7 in. long, glabrous; lfts. 13-21, elliptic-lanceolate to lanceolate, narrowed into a short stalk, minutely emarginate at the apex, crenate-serrulate, $\frac{3}{4}$ -1 $\frac{1}{2}$ in. long: fls. minute, with sepals and petals in terminal short-stalked clusters, 2-4 in. across: fr. greenish or brownish. June; fr. in autumn. Japan, Korea. S.I.F. 2:33.—Sometimes cult. under the name of the following; handsomer in foliage and hardier.

cc. *Prickles in pairs.*

piperitum, DC. Shrub or small tree; prickles rather slender, ascending: lvs. 2-6 in. long, with puberulous rachis; lfts. 11-19, ovate to oblong-ovate, narrowed into a short stalk, emarginate at the apex, remotely toothed, with conspicuous glands at the base of each tooth, midrib pubescent above, $\frac{1}{2}$ -1 $\frac{1}{2}$ in. long: fls. with simple perianth, in small corymbs $\frac{1}{2}$ -1 $\frac{1}{2}$ in. across, on short lateral branchlets; style slender: fr. reddish, glandular-dotted. Japan, Korea, N. China. June; fr. in Sept. S.I.F. 1:52.—The wood, according to Issa Tanimura, is dense and heavy with deep yellow grain; tree commonly cult. in Japan for ornament, to make utensils, and for food; the seeds and inner bark are cooked or pickled; the fresh lvs. are added to soup; and the dried fr. used on roasted fish as a fragrant pepper.

Bungei, Planch. (*Z. Bungeanum*, Maxim.). Spreading shrub or small tree; prickles stout, flattened, very broad

4033. Leaf of prickly ash.—*Zanthoxylum americanum*.

at the base: lvs. 3-5 in., rarely to 9 in. long, often with small prickles on the rachis and on the midrib of the lft. above and below; lfts. 7-11, ovate to ovate-oblong, crenately serrulate, glabrous, $\frac{1}{2}$ -2 in. long: infl. a corymb or panicle, mostly on short lateral branchlets: fr. reddish. June, July; fr. in Sept., Oct. N. and Cent. China.

AA. *Rachis distinctly winged.*

alatum, Roxbg. Shrub or small tree, glabrous, with stout spreading prickles in pairs: lvs. 3-8 in. long, with conspicuously winged sometimes prickly rachis; lfts. 5-11, elliptic-ovate to ovate-lanceolate, rarely obovate-oblong, acuminate, finely serrulate or nearly entire, $1\frac{1}{2}$ -5 in. long, the terminal one the largest: fls. in short lateral panicles, 1-2 $\frac{1}{2}$ in. long, from the axils of last year's branches: fr. red, warty. Himalayas. Var. *planispinum*, Rehd. & Wilson (*Z. planispinum*, Sieb. & Zucc.). Lfts. 3-5, otherwise like the type. June; fr. in Sept. China, Korea, Japan. S.I.F. 2:34. R.H. 1913, p. 17. G. 35:213.—Only the variety seems to be cult.

Z. ailanthoides, Sieb. & Zucc. Tree, attaining 60 ft.: branches with numerous short prickles: lvs. 1-4 ft. long; lfts. oblong-ovate, glabrous, glaucous beneath, 3-6 in. long: fls. and fr. in terminal corymbs. Japan. This is called by Sargent one of the most beautiful trees of Japan.—*Z. clava-Herculis*, Linn. (*Z. carolinianum*, Lam.). TOOTHACHE-TREE. PEPPERWOOD. Small very prickly tree, 30 or occasionally 50 ft.: lfts. 7-17, ovate-lanceolate, pubescent beneath when young, 1-2 $\frac{1}{2}$ in. long; fls. and fr. in terminal panicles. April, May. S. Va. to Fla. and Texas. S.S. 1:29.—*Z. dissitum*, Hemsl. Scandent shrub, to 12 ft. or more: rachis usually with hooked prickles; lfts. 6-15, coriaceous, petioled, elliptic to oblong-lanceolate, entire, lustrous above, often prickly beneath, 3-6 in. long: fls. in axillary panicles 2-5 in. long, with sepals and petals; stamens long-exserted: fr. crowded, yellowish brown: seeds over $\frac{1}{4}$ in. long. Cent. and W. China. This and the two following species have been recently intro. from China.—*Z. Piatezkii*, Maxim. Allied to *Z. piperitum*. Shrub, to 10 ft.: lfts. 7-15, ovate or obovate to oblong, slightly crenulate or nearly entire, quite glabrous, $\frac{1}{2}$ -1 in. long: fls. in small corymbs; style short: fr. warty, reddish. W. China.—*Z. stenophyllum*, Hemsl. Scandent shrub, to 6 ft.: rachis usually with many slender hooked prickles; lfts. 7-13, ovate-oblong to lanceolate, denticulate, glabrous, $1\frac{1}{2}$ -3 in. long: fls. in terminal loose corymbs, 2-3 in. across, with petals and sepals; stamens long-exserted: fr. reddish, beaked; seeds $\frac{1}{4}$ in. long. W. China. Has not proved hardy at the Arnold Arboretum.

ALFRED REHDER.

4034. Indian corn.—*Zea mays*.

ZAUSCHNERIA (named for a professor of natural history at Prague). *Onagraceae*. Low perennials, some of them subshrubby, few of them used in the flower-garden.

Leaves, the lowest opposite, others alternate: fls. racemose, large, scarlet, fuchsia-like; calyx-tube globose, inflated just above the ovary, then becoming funnel-form, 4-lobed, bearing 8 small scales within; petals 4, obcordate, or deeply cleft; stamens 8: caps. slender-fusiform, obtusely 4-angled, 4-valved, many-seeded.—About 7 species, W. N. Amer.

californica, Presl. CALIFORNIA FUCHSIA. HUMMINGBIRD'S TRUMPET. BALSAMEA. Half-hardy perennial with the fl. of a fuchsia and the fr. of an epilobium: height $\frac{3}{4}$ -2 ft.: lvs. linear to oblong, $\frac{1}{2}$ -1 $\frac{1}{2}$ in. long, pubescent or tomentose: fls. scarlet or vermilion, the trumpet-shaped calyx $1\frac{1}{2}$ in. long; calyx-lobes ovate; petals obcordate, spreading: fr. 4-valved, imperfectly 4-lobed. Calif. P.M. 15:195. F. 1847-8:241. Gn. 31:28 and p. 29. R.H. 1849:141. Var. *splendens*, Hort., is perhaps a little more luxuriant plant, otherwise not differing from the type. Var. *latifolia*, Hook. Often nearly glabrous: lvs. broad-ovate to ovate-lanceolate, markedly feather-veined. B.M. 4493. F.S. 4:404.—Varieties have been made based on linear, lanceolate, or ovate lvs., but they run into one another. The plants also vary from glabrous and pubescent to tomentose. As a bedding-plant it has been occasionally used for novelty effects by European gardeners. To overcome its thin and leggy habit, it is well to set the plants rather close and pinch out the young shoots until compact bushes are secured. The plant is sometimes grown in pots for greenhouse decoration in late autumn. There are said to be forms that vary considerably in hardiness. The plant is hardy in most parts of England

4035. Ear or pistillate spike of maize. The husks are a kind of involucre. Each kernel represents a flower. The "silks" are styles.

with slight winter covering. In favored spots it is considered to be a choice plant of pendent habit for the steep sides of rockeries and for naturalizing on old walls. In light and dry soils it spreads underground like the epilobiums. It is prop. by division, by cuttings made in autumn and wintered in a coldframe, or by seeds sown in early spring in mild heat. In Calif. the plant is considered objectionable on account of the unkempt appearance produced by the woolly seeds. It is remarkably resistant to drought.

WILHELM MILLER.

ZĒA (an old Greek name for some common cereal, probably spelt). *Gramineæ*. A large annual grass with monœcious infl., the staminate fls. being in the tassel at the top and the pistillate fls. in one or more ears in the axils of the lvs., each ear inclosed in several reduced lvs. or husks, the numerous styles protruding from the tip as the silk. As now limited the genus is founded on the single polymorphous cult. species, *Zea Mays*, maize or Indian corn (Figs. 4034, 4035, 4036), whose origin is unknown but is suspected by some to be teosinte (*Euchlœna mexicana*). Most of the evidence points to Mex. as the region in which it originated and from which it spread.

After a prolonged study of maize, teosinte, and hybrids between them, Collins advances the hypothesis (Journ. Wash. Acad. Sci. 2:520. 1912) that maize originated as a hybrid between teosinte and an unknown grass belonging

4036. *Zea Mays*.—Flint corn.

in the *Andropogonææ*. This grass is thought to have been not unlike the earless varieties of pod or husk corn (*Zea Mays* var. *tunicata*, Figs. 4037, 4038). The chief distinction between pod corn and the ordinary varieties of maize is that the glumes of the pistillate spikelets are developed in pod corn and completely inclose the grain, while in ordinary maize the glumes are reduced to minute scales at the base of the grain. Collins has found that if plants of pod corn are isolated and bred among themselves for a few generations, there will usually result a still greater divergence from the ordinary type of maize. Plants will appear in which the lateral inflorescence or ear is aborted while the terminal inflorescence is greatly enlarged, containing both stamens and pistils. These may be borne either in separate spikelets, in separate florets of the same spikelet, or in perfect florets. Plants of this earless type of pod corn possess no characters which would exclude them from the *Andropogonææ*. The constant recurrence of such plants among many varieties of corn Collins considers to be strong indication that some perfect-flowered grass has figured in the ancestry of maize. Harshberger (see G.F. 9:522; Contr. Bot. Lab. Univ. Penn. 2:231) after a study of teosinte-maize hybrids, showed that *Zea canina*, Wats. (Figs. 4039, 4040), originally described as a wild species, is an early-generation hybrid between ordinary maize and teosinte. Harsh-

berger concludes that Indian corn is the result of a cross between teosinte and a race or variety of the same species produced by successive cultivation of the wild plant until its characters as a variety or race have become fixed. Collins holds that this conclusion does not take into consideration the evidence afforded by the podded varieties of maize. To explain maize as a hybrid Collins holds that the second parent must be assumed to be some plant radically different from teosinte, for only such a parent would account for the appearance of characters the very opposite of those which characterize *Euchlœna*. Under the article *Corn* are given the botanical characters of the genus, a classification of the subspecies, as proposed by Sturtevant, and a discussion of sweet corn and pop-corn.

The following varieties of *Zea Mays* are grown for ornament:

Var. *japonica*, Koern. (*Z. japonica*, Van Houtte. *Z. vittata*, Hort.). Foliage variously striped with white; plant small; ears small; kernels yellowish, flint. Said to have come from Japan. F.S. 16:1673, 1674. G. 2:463.

Var. *gracillima*, Koern. (*Z. gracillima* and *Z. minima*, Hort.). Very dwarf, slender form with green lvs., sometimes cult. in Eu. A var. *variegata* is also mentioned.

Var. *Curagua*, Alef. (*Z. Curagua*, Molina), is described as a very robust green-lvd. form. Sturtevant places it in the pop-corn tribe. Gn. 42, p. 207.

A. S. HITCHCOCK.

ZEBRINA (name refers to the striped leaves). *Commelinææ*. One of the species, the wandering Jew, is a very common greenhouse plant, much used for baskets and for covering the ground underneath benches.

Differs from *Tradescantia* chiefly in the fact that the corolla is tubular (petals not free); stamens 6,

4038. Cross-section of ear of husk corn. ($\times \frac{1}{2}$)

4037. Pod or husk corn.—*Zea Mays* var. *tunicata*. Each kernel inclosed in a husk. ($\times \frac{1}{8}$)

4039. *Zea canina*, showing the long branches, with ears at the joints.

equal; fls. few, sessile, in 2 conduplicate bracts.—Two species, Mex. and Texas.

péndula, Schnizl. (*Tradescántia zebrina*, Hort. *T. tricolor*, Hort., in part. *Cyanòtis vittata*, Lindl. *Comelina zebrina*, Hort.). WANDERING JEW, in part. Fig. 4041. Trailing, half-succulent, perennial herb

4040. Ears of *Zea canina*. a, Second year from the wild. Cob flattish. b, Third year from the wild. Kernels less pointed. Cob nearly cylindrical. ($\times \frac{3}{4}$)

rooting at the joints: lvs. lance-ovate, sessile, the lf.-sheath about $\frac{1}{2}$ in. long and hairy at top and bottom and sometimes throughout its length; under surface of lf. red-purple; upper surface silvery white, suffused with purplish, the central part and the margins purple-striped: fls. about 2, rose-red, contained in 2 boat-shaped bracts, one of which is much smaller than the other. Mex.—Commonly confused with *Tradescántia fluminensis*, Fig. 3829, and sometimes with *Comelina nudiflora*. See *Tradescántia*. The lvs. of *Z. pendula* seem never to be green. They vary somewhat in color. All forms are easily grown, and

they prop. readily from pieces of st. Var. **quadrícolor**, Bailey (forma *quadrícolor*, Voss. *Tradescántia quadrícolor* and *T. multícolor*, Hort.). Lvs. with metallic green undertone and striped with green, red, and white. Handsome.

L. H. B.

ZELKÒVA (after the vernacular name Zelkoua in Crete, or Selkwa in the Caucasus). Syn., *Abelicea*, and including *Hemiptelea*. *Ulmaceæ*. Ornamental trees grown for their handsome foliage and attractive habit.

Deciduous: lvs. alternate, short-petioled, pinninerved, serrate, stipulate: fls. polygamous, the perfect ones solitary in the axils of the upper lvs., the staminate ones clustered in the axils of lower lvs. or bracts; calyx 4-5-lobed; stamens 4-5; styles 2: fr. a 1-seeded drupe,

4041. *Zebrina pendula*. ($\times \frac{1}{2}$; fl. enlarged) yellowish white

usually broader than high, oblique, with the style eccentric. —Five species in Crete, the Caucasus, and E. Asia. They are closely related to *Celtis* and *Aphananthe* and are chiefly distinguished by the connate sepals, the eccentric style and the oblique fr. *Z. serrata* is an important timber tree; the wood is very durable, and considered the best building material in Japan. The young wood is yellowish white

in color; the old wood is dark brown and has a beautiful grain.

The zelkovas are trees, sometimes shrubby, in general appearance much like some of the small-leaved elms, with rather small more or less two-ranked short-stalked leaves, with insignificant greenish flowers appearing at the base of the young branches and followed by inconspicuous fruits. *Z. serrata* and *Z. Davidii* are hardy North, while *Z. ulmoides* is hardy only as far north as Massachusetts, at least only in sheltered positions. *Z. serrata* is a very graceful round-headed tree and well adapted for avenues or as single specimens on the lawn. *Z. Davidii*, which is of recent introduction, may be useful as a hedge-plant on account of its upright rather stiff stems armed with spines. They do not seem to be very particular as to soil and position. Propagation is by seeds sown soon after ripening; also by layers and by grafting on *Ulmus*.

A. Fr. not winged: branches not spiny.

serrata, Makino (*Z. acuminata*, Planch. *Z. hirta*, Schneid. *Z. Keàki*, Mayr. *Z. cuspidata*, Hort. *Planera acuminata*, Lindl. *Planera japonica*, Miq. *Planera Keàkii*, C. Koch. *Ulmus Keàkii*, Sieb.). Fig. 4042.

4042. *Zelkova serrata*. ($\times \frac{1}{2}$)

Tree, attaining 100 ft., with broad, round-topped head: branches slender: lvs. short-stalked, ovate to oblong-ovate, acuminate, rounded or slightly cordate at the base, sharply and coarsely serrate, with acuminate teeth, pairs of veins about 10, somewhat rough above, almost glabrous, 1-2½ in. long on fertile branches, 2-5 on sterile branches. April, May. Japan. G.F. 6:325. Gt. 37, pp. 22, 23. S.I.F. 1:36. G.W. 16, p. 216.

ulmoides, Schneid. (*Z. crenata*, Spach. *Z. carpinifolia*, Koch. *Planera Richardii*, Michx. *Planera carpinifolia*, Wats. *Planera crenata*, Desf. *Abelicea ulmoides*, Kuntze). Tree, attaining 80 ft., with slender

branches forming an oval or oblong head: lvs. oval or ovate to oblong, slightly cordate or rounded at the base, coarsely toothed with obtusish teeth, with 6-8 pairs of veins, usually almost glabrous above at length, pubescent on the veins beneath, $\frac{3}{4}$ -3 in. long. April, May. Caucasus. Gn. 24, p. 371.

4043. *Zenobia pulverulenta*. ($\times \frac{1}{2}$)

glabrous, $\frac{3}{4}$ -2 in. long; fr. conical, 2-edged, $\frac{1}{4}$ in. long, short-stalked. April, May. N. China, Korea. R.H. 1913, p. 29.

Z. sinica, Schneid. Allied to *Z. hirta*. Tree, to 50 ft.: lvs. ovate-oblong, rounded or broadly cuneate at the base, firm, crenate-serrate, $\frac{3}{4}$ -2 in. long. Cent. China.—*Z. Verschaffeltii*, Nichols. (Ulmus Verschaffeltii, Hort. *Z. japonica* Verschaffeltii, Dipp.). Shrub or small tree, allied to *Z. ulmoides*: lvs. oval or ovate, with 6-9 coarse triangular teeth on each side, rough above, with soft hairs beneath, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. long. Origin not known, possibly from the Caucasus.

ALFRED REHDER.

ZENOBIA (after Zenobia, queen of Palmyra, who lived in the third century; a fanciful allusion to her having been chained as was Andromeda, whose name is commemorated by a closely allied genus). *Ericaceae*. Ornamental shrub grown for its handsome white flowers, and also for the foliage which is covered with a bluish white bloom in one form.

Deciduous or half-evergreen: lvs. alternate, short-petioled, crenulate or entire: fls. in axillary clusters forming terminal racemes on the upper part of last year's branches; calyx 5-lobed, with short valvate lobes; corolla campanulate, as broad as high, obtusely 5-lobed; stamens 10; anthers with 4 slender awns: caps. depressed-globose, obscurely 5-lobed, somewhat carinate at the dorsal sutures, loculicidally 5-valved; seeds numerous, small, oval, angled.—One species in N. Amer., closely allied to *Andromeda* and *Pieris* but chiefly distinguished by the open-campanulate fls. and 4-awned anthers.

Zenobia is a low bush with medium-sized short-petioled leaves entire or nearly so and with handsome white nodding flowers in clusters along the upper part of last year's branches. It is hardy as far north as Massachusetts, and a very handsome shrub for borders of shrubberies, particularly when in bloom; the glaucous form is one of the most conspicuous shrubs with light-colored foliage. After flowering, the flower-bearing part of the shoots should be cut off. *Zenobia* is also recommended for forcing. It thrives best in a sandy or peaty soil. Propagation is by seeds and by layers; also by cuttings of half-ripened wood in July placed

in gentle heat, or by greenwood cuttings from forced plants. See, also, *Andromeda* and *Pieris* for culture.

pulverulenta, Pollard (*Z. speciosa*, Don. *Andromeda pulverulenta*, Bartram. *A. speciosa*, Michx. *A. glauca*, Hort. *A. candida*, Hort. *A. dealbata*, Lindl.). Figs. 4043, 4044. Shrub, 2-4 ft. high, with upright or arching branches: quite glabrous: lvs. oval to oblong, obtuse or acutish, crenulate or finely serrulate, often covered more or less with glaucous bloom, 1-2 in. long: fls. on slender nodding pedicels, clustered and forming racemes, 2-5 in. long; corolla white, $\frac{1}{2}$ in. across. May, June. N. C. to Fla. B.M. 970. L.B.C. 6:551. Gn. 22, p. 271; 24:420; 57, p. 185; 75, p. 212. G.C. III. 23, suppl. May 28. G. 5:299; 6:235; 11:475; 21:179; 28:663. R.B. 31:169. G.M. 31:218; 55:117. Gn.M. 20: suppl. June 20. Var. *nuda*, Rehd. (*Z. cassinifolia*, Pollard. *Andromeda cassinifolia*, Vent. *A. speciosa* var. *nuda*, Michx. *A. speciosa* var. *viridis*, Hort.). Lvs. green, without bloom.

ALFRED REHDER.

ZEPHYRANTHES (Greek, *flower of the west wind*). Syn. *Atamisco*. *Amaryllidaceae*. ZEPHYR FLOWER. FAIRY LILY. Half-hardy tunicate-bulbous herbs, grown in the greenhouse, in window-gardens, and in the garden for summer- and autumn-blooming.

Leaves narrow, usually contemporary with the fls.: peduncle elongated, slender, hollow; spathe membranous, tubular, apex bifid: fls. white, red, or yellow, solitary in the spathe; perianth funnel-shaped, erect or slightly inclined, tube short or elongated, segms. subequal; ovary 3-celled: caps. subglobose, loculicidally 3-valved.—About 53 species, natives of the warmer regions of Amer. A general revision of *Zephyranthes* is found in Baker's Handbook of the Amaryllideae, 1888, where the following subgenera are made: Subgenus *ZEPHYRANTHES* proper. Fl. erect; tube short; stamens inserted near its throat. Subgenus *ZEPHYRITES*. Fl. slightly inclined; tube short; stamens inserted near its throat; style more declinate than in the other two subgenera. Subgenus *PYROLIRION*. Fls. erect; tube longer, dilated in the upper half; stamens inserted at the middle of the perianth-tube. For the further separation of the species, Baker uses the characters which appear in the key below, except the foliage-characters and the color of the fls. However, the genus may be readily separated into 3 sections based on the color of the fl., and this arrangement is here used as being more convenient to

4044. Forced plant of *Zenobia pulverulenta*.

the horticulturist. The seasons of bloom indicated herein are those for localities where the plants will thrive outdoors the year round. For an account of bigeneric hybrids of *Zephyranthes* and *Cooperia*, see Lancaster, Journ. Roy. Hort. Soc. 38, p. 531.

The zephyr lilies must be wintered in a place free from frost, and as the best kinds are natives of swampy places it is fair to presume that they will need more

moisture during the resting-period than the generality of bulbous plants. The best four species are: *Z. candida* (Fig. 4045), white, autumn; *Z. Atamasco*, white, spring; *Z. carinata*, rosy, summer; *Z. rosea*, autumn. All of these will probably survive the winter out-of-doors in the middle states if given a fair degree of protection.

INDEX.

Andersonii, 13.	Conzattii, 6.	rosea, 8.
Atamasco, 1.	erubescens, 4.	striata, 11.
aurea, 10, 15.	grandiflora, 5.	texana, 10.
candida, 12.	Lindleyana, 7.	Treatiæ, 2.
cardinalis, 14.	longifolia, 9.	tubispatha, 3.

KEY TO THE SPECIES.

- A. Stamens inserted near the throat of the perianth-tube.
- B. Fl. erect. (Subgenus *Zephyranthes* proper.)
 - C. Stigma trifid.
 - D. Ovary stalked.
 - E. Perianth white, often tinged with rose outside.
 - F. Length of perianth about 3 in.
 - G. Lvs. channeled, bright green, shining, with acute margins..... 1. *Atamasco*
 - GG. Lvs. thick, semi-terete, deep green, not shining, with rounded margins..... 2. *Treatiæ*
 - FF. Length of perianth about $1\frac{1}{2}$ -2 in.
 - G. Neck of bulb short..... 3. *tubispatha*
 - GG. Neck of bulb about 1 in. long..... 4. *erubescens*
 - EE. Perianth rose-colored or crimson-purple.
 - F. The perianth $2\frac{1}{2}$ -3 in. long.
 - G. Spathe $1\frac{1}{2}$ -2 in. long: pedicel shorter than the spathe..... 5. *carinata*
 - GG. Spathe 1 in. or slightly more long: pedicel usually longer than the spathe..... 6. *Conzattii*
 - FF. The perianth 1-2 in. long.
 - G. Pedicel about as long as the spathe: spathe $1-1\frac{1}{4}$ in. long..... 7. *Lindleyana*
 - GG. Pedicel much longer than the spathe: spathe $\frac{1}{2}$ - $\frac{3}{4}$ in. long..... 8. *rosea*
 - EEE. Perianth yellow, often reddish outside.
 - F. Spathe much longer than the pedicel..... 9. *longifolia*
 - FF. Spathe much shorter than the pedicel..... 10. *texana*
 - DD. Ovary sessile..... 11. *verecunda*
 - CC. Stigma capitate, faintly 3-lobed..... 12. *candida*
 - BB. Fls. somewhat inclined; style declinate. (Subgenus *Zephyrites*.)
 - C. Perianth yellow inside, coppery red outside..... 13. *Andersonii*
 - CC. Perianth cardinal-red inside and out..... 14. *cardinalis*
 - AA. Stamens inserted at the middle of the perianth-tube. (Subgenus *Pyrolirion*.)..... 15. *aurea*

Subgenus ZEPHYRANTHES Proper.

1. *Atamasco*, Herb. (*Amaryllis Atamasco*, Linn.). ATAMASCO LILY. Fig. 4046. Most popular and largest of the spring-blooming white-fl. species; the commonest zephyr lily native to the U. S.: bulb short-necked, less than 1 in. thick: lvs. 4-6, linear: scape 6-12 in. high: fls. pure white, about 3 in. long. March-June. Va. to Fla. and Ala. B.M. 239. L.B.C. 19:1899. Gn. 24, p. 199:37, p. 155. J.H. III. 63:379.

2. *Treatiæ*, Wats. Closely allied to *Z. Atamasco* and best distinguished by the lvs. as indicated in the key: perianth-segms. sometimes keeled with rose, but in both species the fls. turn pinkish with age. It is a Fla. species, found in damper localities and blooming several weeks later than *Z. Atamasco*. V. 6:299. Gn. 33, p. 11. G. 10:603. J.H. III. 53:273.

3. *tubispatha*, Herb. Bulb globose, 1 in. diam.: lvs. narrow-linear, flaccid, bright green, sometimes 1 ft. long: peduncle slender, 6 in. long; spathe $1-1\frac{1}{2}$ in. long, slit at the tip only: perianth $1\frac{1}{2}$ -2 in. long, white, slightly tinged with green, never with red, tube scarcely any, segms. obovate. W. Indies, Venezuela, and Colombia.

4. *erubescens*, Wats. (*Amaryllis erubescens*, Horsford). Rare white-fl. August-blooming species supposed to be native to sandy plains of Texas, but perhaps from N. Mex.: distinguished from the 2 preceding species by the larger, longer-necked bulb, shorter perianth, and fls. strongly tinged with rose outside: bulb over 1 in. thick; neck as long: spathe bifid above: tube equaling and closely embracing the pedicel (about 1 in. long).—Intro. by Horsford 1889 and probably lost to cult.

5. *carinata*, Herb. (*Z. grandiflora*, Lindl.). Largest and choicest of the rosy-fl. species and said by Baker (1888) to be the commonest zephyranthes in cult.; however, the name *Z. rosea* is far commoner in American catalogues: a summer-blooming species with fls. $2\frac{1}{2}$ - $4\frac{1}{2}$ in. across, and about 3 in. long: bulb 1 in. thick, short-necked: ovary stalked: stigma trifid. Jamaica,

4045. *Zephyranthes candida*. ($\times \frac{1}{4}$)

Cuba, Mex., Guatemala. B.R. 902. Gn. 33:10 (erroneously as *Z. Atamasco*). I.H. 35:49. J.H. III. 29:339. G. 21:276; 34:341.

6. *Conzattii*, Greenm. Bulb globose, about 1 in. diam.: lvs. produced after the fls.: peduncle 6-9 in. high, slender; spathes about 1 in. long: perianth (dried) rose-colored or crimson-purple, tube short, segms. oblanceolate, style declinate. Mex.

7. *Lindleyana*, Herb. Rare summer-blooming rose-colored species from the mountains of Mex., inferior to *Z. carinata* for general cult.: bulb globose, $\frac{3}{4}$ in.

thick; neck short: fls. $1\frac{1}{2}$ –2 in. long; ovary stalked; stigma 3-fid; spathe 3-fid only at tip.

8. *rosea*, Lindl. Autumn-blooming rosy-fld. species, with much smaller fls. than *Z. carinata* but, according to American catalogues, the most popular rosy-fld. species: fls. only about 1 in. long and $1\frac{1}{2}$ in. broad: bulb globose, $\frac{3}{4}$ in. thick; neck scarcely any: spathe 2-fid at tip only: ovary stalked: stigma 3-fid. Oct.

4046. *Zephyranthes candida* above and one *Z. Atamasco* below.

Cuba. B.M. 2537. B.R. 821. Gn. 12:88.—Trade plants of *Z. rosea* should be compared with *Z. carinata*.

9. *longifolia*, Hemsl. Summer-blooming, yellow-fld. species, distinguished from the next by characters of pedicel and spathe: bulb ovoid; neck $1\frac{1}{2}$ –2 in. long: spathe tubular in the lower half: pedicel much shorter than spathe: fls. yellow, coppery outside, $\frac{3}{4}$ –1 in. long. New Mex.—Intro. 1889, and probably lost to cult.

10. *texana*, Herb. Yellow-fld. Texan species: bulb globose; neck $1\frac{1}{2}$ in. long: spathe bifid only at the tip: pedicel much longer than the spathe: fls. yellow, coppery outside, 1 in. long, $1\frac{1}{2}$ in. across. B.M. 3596 (as *Habranthus Andersonii* var. *texanus*). Var. *aurea*, Hort., with bright yellow fls., is offered in the trade.

11. *verecunda*, Herb. (*Z. striata*, Herb.). Rare spring- and summer-blooming species, distinguished from other white-fld. species cult. by the sessile ovary and long-necked bulb: bulb 1 in. or less thick; neck 1–2 in. long: fls. $1\frac{1}{2}$ –2 in. long, greenish white, more or less tinged outside or keeled with rose. Highlands of Cent. Mex. B.M. 2583; 2593.—Offered by Dutch dealers.

12. *candida*, Herb. Figs. 4045, 4046. Most popular of white-fld. zephyr lilies, being distinguished from the others by its autumn-blooming habit and capitate stigma: lvs. appearing in autumn with the fls. and lasting through the winter in favored localities, over 1 ft. long: fls. pure white or slightly tinged rose outside, $1\frac{1}{2}$ –2 in. long. Marshes of La Plata. Gn. 37:154; 59, p. 115; 76, p. 551. B.M. 2607. B.R. 724. L.B.C. 15:1419. J.H. III. 43:232. Var. *major*, Hort., has fls. 4 in. long, borne on long stout sts. Uruguay.

Subgenus ZEPHYRITES.

13. *Andersonii*, Baker. Yellow-fld. S. American species of uncertain blooming-time: fls. usually flushed and

veined with red outside and there is a variety with copper-colored fls., inside and out: bulb ovoid, short-necked: fls. $1\frac{1}{2}$ –1 in. long, 2 in. across. Montevideo, Buenos Ayres. L.B.C. 17:1677 and B.R. 1345 (both as *Habranthus Andersonii*).—Apparently the only representative in cult. of its subgenus, which is characterized by strongly declinate stamens.

14. *cardinalis*, C. H. Wright. Lvs. ligulate, acuminate, about 6 in. long, above shining green, slightly canaliculate, below keeled: scape cylindrical, rose below, green above; spathe rose: perianth cardinal-red, tube funnel-shaped about 1 in. long, green, segms. broadly oblong-oblancheolate, subobtuse. Amer. B.M. 8553.

Subgenus PYROLIRION.

15. *aurea*, Baker. Bulb globose, $1\frac{1}{2}$ in. diam.: lvs. about 5, linear, 1 ft. long, $\frac{3}{4}$ in. broad: peduncle 6–12 in. long: spathe membranous, $1\frac{1}{2}$ in. long, cylindrical below: perianth-limb erect, bright yellow, tube funnel-shaped, suddenly dilated at the middle, segms. acute, $1\frac{1}{2}$ x $\frac{1}{2}$ in. Peru. G.C. III. 43:405. G. 34:35. G.M. 54:937. Gn. 72, p. 326.

Z. alba, Hort., with pure white fls. is offered in the trade.—*Z. floribunda*, Hort., is a trade name.—*Z. sulphurea*, Hort., is offered in the trade.

WILHELM MILLER.

F. TRACY HUBBARD.†

ZÍCHYA: *Kennedyia*.

ZÍNGIBER (name ultimately derived from a Sanskrit word meaning *horn-shaped*; probably referring to the ginger root). *Zingiberaceae*. GINGER. Perennial herbs sometimes grown as warmhouse plants, and also for summer bedding in the southern United States for their decorative value; source of ginger.

Rhizomes horizontal, tuberous: sts. leafy, the flowering and sterile differing: lvs. oblong-lanceolate, clasping the st. by their long sheaths: infl. thyrsoid-spike-like, dense cone-like or rather long, terminal or lateral; bracts usually 1-fld.: calyx cylindrical, shortly 3-lobed; corolla-tube cylindrical, segms. lanceolate, upper concave; later staminodes none or adnate to the obovate-cuneate lip; anther-cells contiguous, crest narrow, as long as the cells; ovary 3-celled, ovules many, superposed: caps. oblong, finally dehiscent.—About 70 species, natives of the tropics of the Old World. Monographed by K. Schumann in Engler's *Pflanzenreich*, hft. 20 (IV. 46). It is said by gardeners that in Zingiber the leaves tend to roll up or inward and in Hedychium downward.

The ginger plant is a small reed-like plant 2 feet or more high, as cultivated in greenhouses, with tuberous rhizomes, aromatic leaves and dense cone-like clusters of bracts. The flowers, however, are very rarely produced in cultivation, and Roxburgh wrote that he never saw the seeds. The plant is supposed to be native to India and China, but, like many other tropical plants of economic importance, its exact nativity is uncertain. Some idea of the importance of ginger to the world may be gained by the fact that as early as 1884 Great Britain imported 5,600,000 pounds valued at \$620,000. Medicinal ginger is prepared from the dried "root," condimental ginger from the green. Candied ginger is made from carefully selected succulent young rhizomes which are washed and peeled and then preserved in jars of sirup. Housewives often preserve their own ginger; it is important to have the hands protected while scraping the roots or they will "burn" for days. Ginger probably could be cultivated commercially in southern Florida and California. In Florida it thrives in rich soil and partial shade, and the roots can be dug and used at any time. The plant is cultivated commercially even in localities where it is necessary to lift the roots and store them over the cool season, as in the lower Himalayas. In the West Indies ginger may be cultivated up to an altitude of 3,500 feet.

Zingibers are occasionally cultivated as warmhouse

decorative plants. The shoots having a reed-like appearance, they may often be used to good advantage in arranging plants for artistic effects. They are of the easiest culture. Propagation is effected by division of the rhizomes in spring. These should be potted in fibrous loam to which a third of well-decomposed cow- or sheep-manure has been added. Water should be

given sparingly until the shoots have well developed, when they should have an abundance. They are also benefited by an occasional watering with weak liquid manure water. Toward the end of summer the shoots will begin to mature, when the water-supply should be diminished, and as soon as the plants are ripened off the pots may be stored either under the greenhouse stages or in some other convenient place, where they should be kept almost dry for the winter.

A. Margins of lvs. colored creamy white or often pink.

Dárceyi, Hort.; also spelled *d'Arceyi* and *d'Arcyi*. About 2-3 ft. high: lvs. lanceolate, 6-8 x 2-2½ in., bright shining green with a broad creamy white or often pink margin and oblique stripes of the same color: fls. deep red, ball-like.—Intro. into Fla. This species is not treated by Schumann and is probably of horticultural origin.

AA. Margins of lvs. not colored.

B. Leafy st. differing from the flowering st.: spike from the rhizome.

Midga, Roscoe. About 3 ft. high: lvs. moderately or shortly petioled, linear-lanceolate or nearly linear, attenuate-acuminate and caudate at base, both surfaces glabrous, 10-15 x 1-2½ in., membranaceous: spike ellipsoidal, 2-3½ in. long: fls. white; calyx tubular, acuminate; corolla-lobes lanceolate or oblong-lanceolate, lip obovate, entire, basal-lobes yellow; ovary silky: caps. somewhat ovoid, 3-valved. Japan. B.M. 8570.—It is said to be still a saying in Japan that those who eat this plant forget everything, although no one has yet demonstrated it.

HB. Leafy st. not differing from the flowering st.: spike terminal.

C. Bracts green, often pale-margined, rotundate.

D. Lvs. grass-like, scarcely ¾ in. broad: lip purple, yellow-spotted.

officinale, Roscoe. **GINGER**. Fig. 4047. Sts. normally more than 3 ft. high from a tuberous rhizome: lvs. sessile, lanceolate or linear-lanceolate, attenuate-acuminate at base, up to 8 in. long and scarcely ¾ in. broad: spikes ellipsoidal, obtuse, dense, 2 in. long; bracts ovate, pale green, margins often yellow: calyx crenate; corolla yellowish green, lobes lanceolate, acute, lip oblong-ovate, purple, yellow-spotted, lateral lobes ovate, acute. Native of Trop. Asia, but cult. throughout the tropics and intro. into S. Fla. Gn. 26, p. 284.

DD. Lvs. lanceolate or oblong-lanceolate: lip yellow.

Zerúmbet, Roscoe. Sts. 12-20 in. high, stout, from a tuberous rhizome: lvs. densely aggregated, oblong-lanceolate, acuminate, base acute, both surfaces glabrous or scattered pilose beneath, 3½-6 x 2-2¾ in.: spike subglobose, dense, 2-3½ in. long; bracts obtuse, pale

green, margins pubescent (sometimes, at least when older, red): calyx spathe-like, white; corolla-tube slender, lobes lanceolate, white, lip short, broadly suborbicular or subovate, pale yellow, tinted orange in the center (sometimes red-spotted), lateral lobes short, rotundate. India and Malaya. B.M. 2000.

cc. Bracts red or at the beginning reddish green, later becoming obscurely red or rose, commonly acute.

D. Spike elongated cylindrical, 8 in. or more long, apex obtuse.

spectabile, Griff. Leafy sts. 6 ft. or more high, robust: lvs. subsessile, oblong-lanceolate, acuminate at base, obscurely green above, paler pubescent beneath, 8-12 x 3½ in.: spike 8-12 in. long, a little over 2 in. diam., laxly cylindrical, apex rounded; bracts yellow, finally scarlet, apex obtuse: corolla yellowish white, dorsal lobe deep concave, broad, anterior narrower, linear-lanceolate, lip obovate, emarginate, 2-lobed, lemon-yellow, apex almost black, lateral lobes half as long as midlobe, ovate. Malay Penins. B.M. 7967.

DD. Spike 4 in. or less long, elongated, narrow-fusiform, apex acute.

cylindricum, Moon. Leafy sts. 6 ft. or more high: lvs. sessile, oblong-lanceolate or lanceolate, attenuate-acuminate; base acute, glabrous above, puberulent beneath, up to 8 x 2½ in.: spike 3½ in. long, cylindrical, narrowed at both ends, dense, bracts lower obtuse, upper acute, pale or reddish; corolla-lobes lanceolate, greenish, subequal, greenish, lip yellowish white, lateral lobes small, obtuse. Ceylon.

Z. corollinum, Hance. Leafy sts. differing from the flowering, almost 3 ft. high: lvs. sessile, linear-lanceolate, glabrous above, pilose beneath, 12 x 2½ in.: spike oblong, obtuse, 7 in. long, bracts ovate, scarlet: corolla-lobes red, oblong, acuminate; lip obovate, lateral lobes inconspicuous. China.—Once offered in Fla.

F. TRACY HUBBARD.†

ZÍNINIA (Johann Gottfried Zinn, 1727-1759, professor of medicine at Göttingen). Syn. *Crassina*. *Compositæ*. YOUTH-AND-OLD-AGE. Popular flower-garden subjects for summer and autumn bloom, mostly annual or treated as such.

Annual, perennial, and subshrubby plants, mostly Mexican but ranging from Texas and even Colo. to Chile, probably 16-20 species: lvs. opposite, mostly entire: heads terminal, of fls. which are peduncled or sessile: rays pistillate, fertile, disk yellow or purple, its fls. hermaphrodite, fertile; involucre ovate-cylindric or campanulate, the scales in 3 to many series, broad, obtuse or rounded, more or less colored: achenes laterally compressed, 2-toothed at the summit and frequently 1-awned from the inner angle, rarely 2-awned. See the botanical revision by Robinson & Greenman in Proc. Amer. Acad. Arts & Sci. 32: 14 (1897). Illustrated historical sketch in Gn. 48, pp. 464, 465.

The familiar zinnias (Figs. 4048-4050)

4048. Single zinnia.—*Z. elegans*.

4047. Commercial roots of ginger, as seen in the stores. (× ½)

are hardy plants, growing a foot or more high and covered from July until the first hard frost with double flowers 2 inches or more across. Several well-marked colors are commonly seen in zinnias—white, sulfur, yellow, golden yellow, orange, scarlet-orange, scarlet, flesh-color, lilac, rose, magenta, crimson, violet, purple, and dark purple. There are also variegated forms, but the solid colors are most popular. The zinnia is rich in shades of purple and orange, but lacks the blue and pink of the China aster and is poor in reds compared with the dahlia. Three forms or classes of the common zinnia (*Z. elegans*) may be noted here:

I. Tall zinnias are ordinarily 20 to 30 inches high. This size and the next smaller size are the favorites for general purposes. The tall kinds are available in twelve and more colors. A robust race, which attains 28 to 40 inches under perfect conditions, is sometimes known to the trade as *Z. elegans robusta grandiflora plenissima*. It is also known as the Giant or Mammoth strain. This strain was developed after many years by Herr C. Lorenz and was introduced in 1886. A maximum diameter of 6 inches is recorded for flowers of this strain. In G.C. II. 26:461 is shown a flower measuring 4 by 4 inches, with about eighteen series of rays, the latter being so numerous and crowded that the flower is less regular than the common type. A specimen zinnia plant 3 feet high is attained in the North only by starting the seed early and giving perfect culture.

II. Medium-sized zinnias range from 12 to 20 inches in height. They are available in several colors. Here belong most of the forms known to trade catalogues as *Z. pumila*, *Z. nana*, and *Z. compacta*.

III. Dwarf zinnias range from 3 to 12 inches in height and are of two subtypes, the pompons and the Tom Thumbs. The pompons, or "Liliputians," are taller-growing and smaller-flowered, generally about 9 inches high, with a profusion of flowers about 2 inches across. The Tom Thumb type represents the largest possible flower on the smallest possible plant. Both types are available in several colors, not all of which are yet fixed in the seed.

Second in importance to *Z. elegans* is *Z. Haageana*. The single form was introduced to cultivation about 1861 and the double about 1871. It is dwarfer than most zinnias, and has smaller flowers, with a color-range restricted to shades of orange. It is distinct and pretty but less showy than the common zinnias. The first race of hybrids between *Z. Haageana* and *Z. elegans* appeared in 1876 under the name of *Z. Darwinii*. This group is said to resemble *Z. elegans* in size and color of flowers and to recede from *Z. elegans* in habit, being more branched and forming a broader and thicker bush.

Zinnias are of the easiest culture, thriving in any deep good soil, whether loamy or sandy. The seeds may be sown about May 1, or whenever the soil is in fit condition for hardy annuals. Such treatment will give flowers from the first of July until frost. The young plants should be thinned so as to stand 1 to 2 feet apart, depending on whether they are of medium- or tall-growing habit. By midsummer the foliage should obscure the ground. For the very best results the seed may be started indoors about April 1, and the seedlings transplanted once or twice before being placed outdoors in permanent quarters. Dwarf varieties should be set 14 to 16 inches apart; taller kinds 2 feet each way. Zinnias are essentially coarse plants, but if the tall kinds are massed heavily in the borders or at some distance they produce striking and very acceptable effects. Their colors are strong, and the stoutness of stems and foliage add to the composition.

4049. Double zinnias—*Z. elegans*. ($\times \frac{1}{2}$)

A. Plant annual.

B. Achenes of the disk-fls. short and broad, obovate, $2-2\frac{1}{2}$ lines long.

C. Colors various: lvs. clasping, cordate-ovate or elliptic.

élegans, Jacq. YOUTH-AND-OLD-AGE. Figs. 4048-4050. Erect annual, a foot or more high, but varying from 3 in.

4050. Common garden zinnias. single and semi-double.—*Z. elegans*.

to 3 ft.: lvs. ovate or elliptic, clasping, about 1 in. wide; rays becoming reflexed, originally purple or lilac, but now of nearly every color except blue and green; disk originally yellow or orange, but nearly or quite absent in the common double forms: fls. 2-5 in. across. July to Oct. Mex. Single forms are pictured in B.M. 527. P.M. 1:223, B.R. 1294 (the last two as *Z. violacea*). Double forms, F.S. 13:1394, R.H. 1861:251; 1864:331, G. 4:138. Pompons in Gn. 48, p. 464 (Liliput); 30:270 (deceptive as to size), R.B. 20, p. 152.—The common species from which most of the garden zinnias are derived.

cc. *Color orange: lvs. sessile, narrower, lanceolate.*

Haageana, Regel (*Z. mexicana*, Hort.). Fig. 4051. Distinguished from *Z. elegans* by the orange-colored fls., which are generally smaller; also the plant is dwarfer, as a rule, and the lvs. are merely sessile, not clasping. Trop. Amer. Single forms, Gn. 30, p. 270; 48, p. 464. Double, Gn. 30, p. 271; 48, p. 464, G. 2:73. F. 1871, p. 229, A.G. 13:218. Var. *stellata*, Hort. Florets twisted and acuminate, orange-yellow.—This is considered by Robinson & Greenman as a horticultural species not certainly distinguishable from *Z. angustifolia*, in spite of its broader lvs.

BB. *Achenes longer, narrower, oblong, 3-4 lines long.*

c. *Color of rays yellow; disk yellow.*

pauciflora, Linn. An erect annual: lvs. lanceolate to oblong-ovate, usually rough: heads yellow, about 1 in. across, with rather broad, spreading, red, purple or

4051. *Zinnia Haageana*. ($\times \frac{2}{3}$)

mostly yellow rays in cult. specimens: plant hirsute, with spreading hairs; somewhat corymbosely branched above: peduncles at maturity enlarged upward and hollow. Mex., Peruvian Andes.

cc. *Color of rays red or purple.*

D. *Rays suberect or scarcely spreading; disk yellow.*

multiflora, Linn.

This and the next are included by most writers in *Z. pauciflora*, but *Z. multiflora* may be distinguished from *Z. pauciflora* by the pubescence of the st. being much finer, appressed or rarely spreading, and the rays red or purple, mostly narrow and suberect or scarcely spreading. B.M. 149.

DD. *Rays revolute; disk dark-colored.*

tenuiflora, Jacq.

Fig. 4052. Very distinct by reason of its linear rays which are cardinal-red in color, becoming revolute. It has a dainty fl.-head about 1 in. across hardly comparable with the showy *Z. elegans*. This species has been cult. in Amer. but seems to be no longer advertised here. It is referred to *Z. pauciflora* by most writers, and to *Z. multiflora* by Robinson & Greenman. B.M. 555. A.G. 11:243.

AA. *Plant perennial.*

grandiflora, Nutt. Hardy, low-growing, Colo. perennial, with woody root, erect, stiff, and very rough st. having a shrubby base, linear lvs., and sulfur-yellow rays which are very broad, almost round in outline: lvs. less than 1 in. long and 3-nerved. Colo., New Mex., Ariz., Mex.

WILHELM MILLER.

ZIZANIA (an old Greek name of some wild grain). *Gramineæ*. Tall aquatic grasses with lush sts., long blades, and large terminal panicles of monœcious fls.: spikelets 1-fl., the pistillate upper portion of the panicle narrow and appressed, the staminate lower portion spreading; pistillate spikelets long-awned.—Species 3, 2 in N. Amer. and 1 in N. Asia.

palustris, Linn. (*Z. aquatica*, of Auth., not Linn.) INDIAN RICE. WATER OATS. WATER RICE. WILD RICE. Fig. 4053. Annual: culms tall, as much as 9 ft.: lvs. broad and flat.—Recommended for borders of lakes and ponds. The grain is excellent for fish and waterfowl. Wild rice lakes and ponds are favorite resorts of sportsmen in the fall. Before sowing, put the seed in coarse cotton bags and sink them in water for 24 hours. Sow in water from 6 in. to 5 ft. deep, with soft mud bottom, or on low marshy places which are covered with water the year round. In running water, sow as much out of the current as possible. Sportsmen are not generally aware that seed can be obtained in large quantities and at a reasonable price from seedsmen. Wild rice is very desirable for aquatic gardens, being one of

4052. *Zinnia tenuiflora*. ($\times \frac{2}{3}$)

the handsomest of tall hardy grasses for the margins of ponds. C.L.A. 16:40. G. 24:21. Gn. 71, p. 191. See U. S. Dept. Agric. Bur. Pl. Ind. Bull. No. 50, Wild Rice: Its Uses and Propagation; also Recreation 32:149.

A. S. HITCHCOCK.

4053. *Zizania palustris*.

Sask. and S. D. to Fla. and Texas.—A weedy-looking plant.

AA. Rays of umbels 2-12, slender, diverging.

Bébbii, Brit. Distinguished from *Z. aurea* by the rays and by the fr., which is oval or broader, 1-1½ lines. May. Mountain woods, Va. and W. Va. to N. C. and Ga.

F. TRACY HUBBARD.†

ZÍZYPHUS (from Zizouf, the Arabian name of *Z. Lotus*). *Rhamnaceæ*. JUJUBE. Ornamental woody plants grown chiefly for their handsome foliage, and some species for their edible fruits.

Deciduous or evergreen shrubs or trees: lvs. alternate, short-petioled, 3-5-nerved from the base, serrate or entire; the stipules mostly transformed into spines, often only one stipule spiny or one a straight and the other a hooked spine: fls. 5-merous; ovary 2-4, usually 2-loculed; style usually 2-parted: fr. a subglobose to oblong drupe.—About 40 species distributed throughout the tropical and subtropical regions of both hemispheres, allied and very similar to *Paliurus*, but chiefly distinguished by the drupe-like fr. The fr. of *Z. sativa*, *Z. Jujuba*, and *Z. Lotus* are edible, and the first-named is cult. in China.

The jujubes are slender-branched shrubs or small trees with prickly branches, usually 2-ranked, small or medium-sized generally oval or oblong leaves and with small greenish or whitish flowers in axillary cymes followed by drupe-like sometimes edible fruits. They are not much cultivated in this country and none of the species is hardy North; the hardiest seems to be *Z. sativa*

but it is tender north of Washington, D. C. Most kinds have handsome foliage and are well adapted for planting in shrubberies in the southern states and California. They seem to thrive in any well-drained soil. Propagation is by seeds, by greenwood cuttings under glass and by root-cuttings.

Jujûba, Lam. Fig. 4054. Tree, 30-50 ft. high: branches usually prickly; young branchlets, petioles and infl. densely rusty tomentose: lvs. broadly oval or ovate to oblong, obtuse, sometimes emarginate, serrate or entire, dark green and glabrous above, tawny or nearly white-tomentose beneath, 1-3 in. long: fls. in short-stalked many-fld. axillary cymes: fr. subglobose to oblong, usually orange-red, ½-¾ in. long, on a stalk nearly half its length. March-June. S. Asia, Afr., Austral. Gn. 13, p. 194. S.M. 3:447.—Variable in shape and color of the fr.; for figures of several varieties see Hooker Jour. Bot. 1 (1834):321. The jujube is somewhat planted in Fla. and Calif., although it yet has no commercial rating as a fr.-plant. The frs. or berries are ripe in Nov. and Dec., and the plant begins to bear at 3 years from planting. The jujube fr. is used in confectionery.

sativa, Gaertn. (*Z. vulgaris*, Lam.). COMMON JUJUBE. Shrub or small tree, attaining 30 ft., glabrous: prickly or unarmed; the longer prickles up to 1½ in. long: branchlets often fascicled, slender and having frequently the appearance of pinnate lvs.: lvs. ovate to ovate-lanceolate, acute or obtuse, oblique at the base, sometimes

4054. Jujube.—*Zizyphus Jujuba*. (× nearly ¼)

emarginate, serrulate, glabrous, $\frac{3}{4}$ –2 in. long; fls. yellowish, fascicled, in axillary cymes: fr. ovoid to oblong, dark red or almost black, $\frac{1}{2}$ – $\frac{3}{4}$ in. long, short-stalked. March–June. S. Eu., S. and E. Asia; naturalized in Ala. R.H. 1859:602, 603. F.E. 19:395 (pl. 96). Var. *inermis*, Schneid. (*Z. vulgaris* var. *inermis*, Bunge). Branches unarmed. A.G. 12:79.

Z. Girdlitzii, Sprenger. "A fine tree with a slender st. and compact crown and black edible fr." N. China. This is probably not different from *Z. sativa*, which occurs in N. China and has been collected there by Girdlitz according to his herbarium specimens.—*Z. Joazeiro*, Mart. Lvs. broadly ovate, acutish, cordate at base, serrulate, nearly glabrous, 2–3 in. long; cymes many-fld.: fr. cherry-like, yellow. Brazil.—*Z. Lotus*, Lam. Prickly shrub, 3–4 ft. high; lvs. ovate-oblong, crenulate, glabrous; fls. in few-fld. axillary cymes: fr. subglobose, yellow. S. Eu., N. Afr.—*Z. Mistol*, Griseb. Spiny tree, to 30 ft.: lvs. short-petioled, coriaceous, oval, obtuse or retuse, subcordate at base, minutely and sparingly serrulate, hoary pubescent, about 1 in. long; fr. black, $\frac{1}{2}$ in. diam. Argentina.—*Z. nummularia*, DC.—*Z. rotundifolia*.—*Z. oxyphylla*, Edgew. Closely related to *Z. sativa*. The slender prickles about $\frac{1}{2}$ in. long; lvs. ovate, acute, finely crenate-serrate: fr. elliptic, black, acid, less than $\frac{1}{2}$ in. long. Temp. Himalaya. A plant intro. under this name from Arabia by the Dept. of Agric. is said to have sweet frs. of date-like flavor.—*Z. Paliurus*, Willd.—*Paliurus Spina-Christi*.—*Z. Párryi*, Torr. Belongs to the genus *Condalia*, which is easily distinguished by not having spiny stipules but the branchlets transformed into slender thorns and by its entire, usually pinnately-nerved lvs. *C. Párryi*, Weberb., is a much-branched, glabrous thorny shrub, 4–15 ft. high; lvs. elliptic to obovate, obtuse, cuneate at the base, $\frac{1}{2}$ – $\frac{1}{2}$ in. long; fls. slender-pedicelled, in sessile clusters: fr. ovoid, $\frac{1}{2}$ in. long. S. Calif. This plant was once offered by a collector of native plants, but it is probably not in the trade now.—*Z. rotundifolia*, Lam. Shrub, heavily armed: lvs. ovate to orbicular, tomentose on both surfaces: fr. globose, black, woody, about $\frac{3}{4}$ in. diam. Persia eastward.—*Z. rugosa*, Lam. Large evergreen shrub or small tree, sometimes of climbing habit, armed: lvs. elliptic, glabrous above, 2–6 in. long; fr. fleshy, 1-seeded, obovoid or globose, $\frac{1}{4}$ – $\frac{1}{2}$ in. diam. Himalaya.—*Z. Spina-Christi*, Willd. Small prickly tree: lvs. oval to oblong, crenulate, glabrous or pubescent on the veins beneath: fls. in axillary clusters; pedicels tomentose; fr. ovoid-globose, red. N. Afr., W. Asia. This species is supposed by some to have furnished Christ's crown of thorns; see also *Paliurus Spina-Christi*.

ALFRED REHDER.

Cultivation of the jujubes.

While several species of *Zizyphus* bear edible fruits, *Z. Jujuba* is the only one of much importance in cultivation. As to its original country, preponderance of evidence favors Syria, from whence it was carried to Europe by Sextus Popinius toward the end of the reign of Augustus Cæsar, about the beginning of the Christian era, and soon spread to all the countries bordering the shores of the Mediterranean. It is a quite hardy tree but its cultivation in Europe is confined to the warmer parts of Italy, France, Spain, and Portugal, and in Africa to the northern states of that continent. Its first introduction into the United States seems to have been by Robert Chisolm who brought trees from Europe in 1837 and planted them at Beaufort, North Carolina. It was introduced to California and neighboring states from southern France by the writer in 1876. The original trees of this importation are still growing in Sonoma Valley and have reached a height of 25 feet and a diameter of trunk of 8 to 10 inches, and are annually bearing abundant crops of fruit.

The tree is of drooping habit, the branches, especially in autumn, bending down with the burden of fruit. Its delicate light green foliage renders it very ornamental, while its reddish brown shining fruit, the size and shape of a small olive, adds to its beauty in autumn. The fruit is dry and wrinkled when fully ripe and has a subacid flavor which is pleasing to most persons. In southern Europe it is used to a considerable extent as a table dessert and in winter as a dry sweetmeat. It is regarded as a valuable pectoral and is esteemed for throat troubles in the form of pastes, tablets, sirup, and the like.

The tree has been extensively cultivated in northern China for thousands of years and hundreds of varieties have been developed. Frank N. Meyer, an explorer sent out by the Office of Foreign Seed and Plant Introduction of the United States Department of Agriculture, has introduced many of the best varie-

ties, most of which are now fruiting at the Department experiment station, and are being distributed in the least frosty sections of the country. The fruits of the Chinese varieties are much larger than those grown in Europe, but are somewhat inferior in flavor. In China orchards of hundreds of acres in extent were observed by Meyer in the vicinity of the cities. One variety has recently borne at the Introduction Garden at Chico, California, the fruit of which is as large as an average hen's egg. Meyer says there are 300 or 400 varieties in cultivation by the Chinese. Some types are spherical and brown in color, others elongated and light mahogany-brown. Some sorts are eaten fresh and others are dried and keep indefinitely. The largest varieties when processed with sugar and honey make a delicious sweetmeat, comparable to a good quality of Persian dates. The Chinese shops in this country carry stocks of the dried and processed fruits which are much appreciated, not only by the Chinese, but by Europeans. Most of the varieties are armed with sharp stipular thorns, though occasionally thornless and seedless sorts have been produced.

Besides *Zizyphus Jujuba*, which produces the best fruits, other species are useful in various ways. *Z. Joazeiro* of Brazil, according to Dorsett, Popenoe, and Shamel, is a beautiful dense umbrageous tree producing enormous crops of fruit which is greedily eaten by sheep, cattle, horses, and swine, and has the advantage of thriving in very arid regions. *Z. Lotus* grows about the shores of the Mediterranean, the fruit of which, though inferior to *Z. Jujuba*, is eaten by the people of its native country. *Z. rotundifolia* (*Z. nummularia*) is a thorny shrub native of northwestern India where it is much used as a garden hedge. The fruit is small, but of pleasant subacid flavor. *Z. rugosa*, with an edible drupe, is harder than the last, ascending in Burma to 4,000 feet. *Z. sativa* is a small or medium tree of Syria and northern India, ascending the Himalayas to 6,500 feet, therefore quite hardy. Its fruit is the size of a large olive, acid, but used for pastes and pectoral lozenges. *Z. Spina-Christi* is a bush used for hedges, so named from a notion that the crown of thorns was fashioned from the twigs. *Z. Mistol* is a small tree of Argentina with edible fruit with large stones.

The common jujube thrives in nearly all parts of the southwestern states and California and on all kinds of soil, except heavy clay and in wet locations, and requires little irrigation. The trees are planted 15 to 20 feet apart and are given the usual orchard cultivation. On account of their beauty the trees are often planted in dooryards. Propagation is by seeds or offsets. The seeds are very hard and are often cracked before planting, otherwise they will be one or even two years in germinating. Seedlings have been known to blossom at one year, but four years is more usual. As established trees send up abundant sprouts, the usual method of propagation is by this means.

The trees are regular bearers and the crop is never cut off by spring frosts, as they do not blossom until June in the valleys of California. The fruit of most varieties ripens in October and November and if desired for consumption fresh is gathered when showing the characteristic reddish brown or mahogany color, but if to be dried it is left on the tree until it assumes a darker shade and the skin is wrinkled. In this condition, after a short exposure to the sun the fruit will keep a year or longer. For preserving in sirup or glacé, the unwrinkled fruit, being slightly more acid, is preferred.

The jujube is well worth the attention of fruit-growers and when produced in sufficient quantities will find an active demand from citizens from the south of Europe. It will appeal to all when fresh from the tree when properly processed, and for its medicinal virtues when simply dried or made into pastes or tablets. G. P. RIXFORD.

CXX. Zinnia, Giant Yellow and Scarlet.

ZOYSIA (after Karl von Zoys, an Austrian botanist). *Gramineæ*. Low creeping maritime perennials, sometimes used for lawns and putting-greens. Propagated by cuttings of the rhizomes.

Flowers in a close spike-like panicle; spikelets closely appressed, 1-fld., awnless, the single glume coriaceous, acute, compressed, inclosing the lemma and palea.—Species 4. S. E. Asia and Australasia.

japonica, Steud. **KOREAN LAWN-GRASS**. **PALM-BEACH GRASS**. Somewhat coarser than *Z. Matrella*, the blades as much as $\frac{1}{2}$ in. wide, the panicles about 1 in. long, often purplish. A native of Japan and China; intro. many years ago from Korea; now grown in Fla. and is hardy as far north as Conn. Recommended for use on sandy soil from N. C. to Fla. Dept. Agric., Div. Agrost. 20:29.

Matrella, Merr. (*Z. püngens*, Willd. *Osterdämia Matrella*, Kuntze). **MANILLA GRASS**. Sts. creeping, throwing up numerous short leafy shoots and flowering sts.: lvs. crowded, firm, 1–3 in. long, ending in a sharp hard point; spikes 1–2 in. long; spikelets $\frac{1}{2}$ in. long, smooth and hard. A native of S. E. Asia, E. Indies.—Grown in Fla. and along the Gulf Coast.

tenuifolia, Willd. **MASCARENE GRASS**. **VELVET-GRASS**. Lvs. thread-like, finer than in the other species. Forms a beautiful turf resembling that of red fescue. Native of the Mascarene Isls. Intro. into the U. S. from Guam in 1912. Used in Calif. where it is called velvet-grass, and along the Gulf Coast.

The name velvet-grass describes it very aptly as it looks like dark green velvet. It grows so thickly that it will smother out any other plant, even Bermuda- or “devil”-grass. Even if frozen off it will come up from roots. It needs little water, no cutting, will run out all other plants, will not become a pest as it sets no seeds in California, and is lovely in appearance. It is so fine that it may be pulled into thousands of pieces to the square foot and every little piece will grow, so that a small quantity will plant a large area. (Ernest Branton.)

A. S. HITCHCOCK.

ZYGADENUS (Greek, *yoke* and *gland*, some of the species having two glands in the base of the perianth). *Liliaceæ*. Smooth and somewhat glaucous perennials with non-bulbous rhizomes or with tunicate bulbs; some of the species are grown in pots, others in the open; interesting plants of secondary importance horticulturally.

Leaves radical or gathered at the base of the st., long-linear, those of the st. small and few; raceme terminal, simple or paniculately branched: fls. perfect or polygamous, white, yellowish or greenish; perianth withering-persistent, spreading, the petal-like oblong or ovate sepals 1–2 glandular near the more or less narrowed but not clawed base; stamens 6, free: caps. 3-celled in fr., the cells separate at the top or for their entire length.—About 25 species have been described, one of which is Siberian, one Japanese, and the remainder from N. Amer. including Mex. The species of *Zygadenus* are little known in cult. They are sometimes recommended for the wild-garden, where they thrive in wet or boggy places. Increased by division; also rarely by seeds. Some or all of the species have poisonous seeds, bulbs, rhizomes, and foliage, being known as “death camas” (see Bull. No. 125, Professional Paper, U. S. Dept. Agric., May 13, 1915). Monographed by Watson. Proc. Amer. Acad. Arts & Sci. 14:278 (1879), so far as American species were then concerned.

A. Sts. from a creeping rootstock.

glaberrimus, Michx. Sts. 1–3 ft. high: lvs. grass-like, channeled, conspicuously nerved, elongated, tapering to a point: panicle pyramidal, many-fld.: fls. perfect; sepals ovate, becoming lance-ovate with a short claw. Va. to Fla. and Ala. B.M. 1703 (as *Helonias bracteata*). L.B.C. 1330. G.W. 6, p. 269.

AA. Sts. from a more or less bulbous base.

B. Locules of the caps. dehiscing to the base: stamens free from perianth-segms.: glands usually 1 or 2 in the base of the perianth. (*Zygadenus proper*.)

C. Glands large, covering nearly the whole base of the perianth-segms.: bulb tunicate.

D. Fls. usually perfect, rather large.

élegans, Pursh (*Z. glaucus*, Nutt. *Helonias glaberrima*, Ker. *Anticlea elegans*, Rydb.). Three feet or less tall, the lvs. $\frac{1}{2}$ in. or less broad and very glaucous: bracts purplish: fls. greenish, in simple or sparingly branched racemes, the segms. broad and less than $\frac{1}{2}$ in. long, coherent to the ovary, the fl. opening about $\frac{1}{2}$ in. across. Across the continent from New Bruns. and south to New Mex. B.M. 1680. B.R. 24:67.

Frémontii, Torr. Lvs. an inch or less broad, less glaucous than the above: bracts green: fls. usually larger, rotate, the segms. free from the ovary. Calif. from San Diego north, in the Coast Range.—One of the “soap plants.” Said to be the best of the genus for cult.

Nuttallii, Gray (*Toxicoscordion Nuttallii*, Rydb.). Lvs. from $\frac{1}{4}$ – $\frac{3}{4}$ in. wide, scarcely glaucous, light green: bracts scarious: fls. $\frac{1}{2}$ in. across, in a simple or branched raceme, the segms. free from the ovary. Kans. to Colo. and Texas.

DD. Fls. polygamous, small.

venenosus, Wats. Slender, 2 ft. or less tall: lvs. very narrow ($\frac{1}{4}$ in. or less), scabrous, not glaucous, the st. lvs. not sheathing: bracts narrow, scarious: fls. in a short simple raceme, the perianth free from the ovary, the segms. $\frac{1}{4}$ in. or less long, triangular-ovate to elliptic, short-clawed. Calif.—Bulb poisonous.

paniculatus, Wats. Usually stouter, the lvs. broader and sheathing: raceme compound: perianth-segms. deltoid, acute, short-clawed. Sask. to Calif.—Bulb poisonous.

cc. Glands very obscure: bulb somewhat fibrous, narrow.

leimanthoides, Gray (*Oceanórus leimanthoides*, Small). St. slender and leafy, 4 ft. or less tall: lvs. $\frac{1}{2}$ in. or less wide, green on both sides: racemes panicled: fls. about $\frac{1}{2}$ in. across, the segms. oblong, not clawed. N. Y. to Ga.

BB. Locules dehiscing only above middle: stamens inserted on perianth-segms.: glands none: bulbous. (*Amianthium*; preferably retained as distinct genus.)

muscatóxicus, Regel (*Helonias læta*, Ker. *Amianthium muscatóxicum*, Gray. *Chrosperma muscatóxicum*, Kuntze). **FLY-POISON**. Slender, 4 ft. or less tall: lvs. rather short, the basal ones varying from $\frac{1}{2}$ in. to over 1 in. broad, not glaucous: racemes simple: fls. about $\frac{1}{2}$ in. across, the segms. ovate-oblong and obtuse. N. Y. to Fla. and Ark. B.M. 803; 1540. L.B.C. 10:998. Gn. 57, p. 160.—Bulb and herbage poisonous. A fly-poison has been made from the bulb. I. H. B.

ZYGOCÁCTUS (cactus with zygomorphic flowers). *Epiphyllum* of horticulturists. *Cactaceæ*. **CRAB-CACTUS**. This genus is confined to Brazil, so far as known, where the plants grow as epiphytes upon the trees, along with orchids, growing in large clusters on the branches: sts. flat and jointed, becoming rounded with age, bearing areoles only on the margins and more or less truncated ends, from which grow the new branches and the conspicuously zygomorphic fls.; ovary devoid of bracts, and those of the tube comparatively large and colored as the petals. The genus is allied to *Epiphyllum* (*Phyllocactus*), with which it was at first united; but it is still more closely connected with *Sehlbergiera*. In cult. many forms have been produced through hybridization between the different species and with *Epiphyllum* and the allies of *Cereus*, so that typical plants are rarely met with.

4055. *Zygocactus truncatus*. ($\times \frac{1}{2}$)

truncatus, Schum. (*Epiphyllum truncatum*, Haw.). CRAB CACTUS. CHRISTMAS CACTUS. Fig. 4055. Sts. much branched and hanging in large bunches from the trees; joints obovate to oblong, with strongly truncate apex, $1\frac{1}{4}$ –2 in. long by about $\frac{3}{4}$ –1 in. broad, bright green, margins coarsely serrate, with 1–3 large, acute teeth on each side, the 2 upper ones forming more or less incurved horns on either side of the truncation: areoles bearing a few short yellowish or dark-colored bristles, or sometimes none: fls. horizontal, growing from the truncated end of the younger joints, strongly irregular, $2\frac{1}{2}$ –3 $\frac{1}{2}$ in. long, in various shades of red: fr. pear-shaped, red, about $\frac{3}{8}$ in. diam. Brazil.

B.M. 2562. G.C. III. 19:9.—Most of the forms in cult. are hybrids between this species and some other of the genus or with allies of *Cereus*. A common basket- and rafter-plant.

For *Epiphyllum Russellianum* and *E. Gartneri*, see Schlumbergera.

J. N. ROSE.

ZYGOCOLAX (compounded from *Colax* and *Zygopetalum*). *Orchidaceae*. Hybrids between the genera *Colax* and *Zygopetalum*. *Z. Amesianus*, Hort. (*Z. brachypetalum* $\times$ *C. jugosus*). Fls. larger than the latter parent; sepals and petals clear green, heavily marked with dark purple; midlobe of lip heart-shaped, white, with interrupted radiating lines of violet-blue.—*Z. Charlesworthii*, Hort. (*Z. Perrenoudii* $\times$ *C. jugosus*). Fls. dark green; sepals and petals closely marked with purplish chocolate; lip violet with a white margin.—*Z. leopardinus* (*Z. maxillare* $\times$ *C. jugosus*). Fls. about 2 in. across; sepals and petals whitish, spotted and marked with brown-purple; lip 3-lobed, side lobes indigo-blue, midlobe same color but mottled with white.—*Z. Veitchii*, Rolfe (*Z. crinitum* $\times$ *C. jugosus*). Fls. about 3 in. across; sepals and petals light yellow-green, spotted and blotched with brown-purple; lip whitish with radiating lines of violet-purple. B.M. 7980. Gn.W. 20:89. J.H. III. 57:243.—*Z. Wigani-anus*, Hort. (*Z. intermedium* $\times$ *C. jugosus*). Similar to the former in habit: fls. slightly larger; sepals and petals pale green, barred with light brown; lip white with violet lines. G.M. 43:121. Var. *superbus*, Hort., has sepals and petals broad and rounded at the tips, heavily barred and marbled with very dark purple; lip flattish, extending horizontally, white heavily marked with violet. G.C. III. 31:156. G.M. 45:142.—*Z. woodlandense*, Hort. (*Z. maxillare* var. *Gautieri* $\times$ *C. jugosus*).

F. TRACY HUBBARD.

ZYGONÍSIA (compounded from *Aganisia* and *Zygopetalum*). *Orchidaceae*. Hybrids between the genera *Aganisia* and *Zygopetalum*. *Z. Rolfeana*, Hort. (*Z. maxillare* var. *Gautieri* $\times$ *A. lepida*). In general appearance like the latter parent; its fls. cream-white, blotched with violet. G.C. III. 32:30. F.S.R. 3:176.—*Z. Sanderi*, Hort. (*A. lepida* $\times$ *Z. sp.*), has cream-white fls. heavily blotched with violet.—These hybrids are not much known.

ZYGOPÉTALUM (name referring to the united flower parts). *Orchidaceae*. Mostly epiphytic orchids of easy culture.

Plants with numerous distichous lvs. sheathing a short st. which usually becomes thickened into a pseudobulb: lvs. membranaceous, venose or plicate: fls. solitary or in racemes, showy; sepals and petals nearly alike in form and color, often united to each other at the base, the lateral sepals forming a mentum with the foot of the column; labellum with the lateral lobes scarcely prominent, middle lobe broad and plane, spreading, or recurved at the apex, with a prominent fleshy crest on the disk; column incurved, wingless or with small wings; pollinia 4, not appendiculate.

The *Z. Mackaii* group grow well under pot culture. One or two species with creeping rhizomes, like *Z. maxillare*, thrive best on sections of tree fern, osmunda rhizome, or in baskets. A good compost consists of equal parts of chopped sod, peat-fiber and sphagnum moss, well mixed and interspersed with pieces of rough charcoal, about one-half of the pot space being devoted to clean drainage material. After distributing the roots, the compost should be worked in carefully but not too firmly about them, leaving the base of the plant even with, or just above, the rim of the pot. Repotting should be done when the plants show new root-action. The temperature should range about 60° F. by night and 65° to 70° by day in winter, and in summer as low as possible, with free ventilation during inclement weather. A cool, light location in the cattleya department is favorable. The compost should be kept in a moist condition at all times. The plants are propagated by cutting through the rhizome between the old pseudobulbs at a good eye, potting up the parts and removing them to a rather higher temperature until they start into new growth. (Robt. M. Gray.)

A. *Anther long-rostrate*.

rostratum, Hook. Pseudobulbs oblong, compressed: lvs. lanceolate, 5 in. long: scapes 4 in. long, bearing 1–3 fls.: sepals and petals linear-lanceolate, greenish brown, wavy, 2–3 in. long; labellum about as long as the petals, subrotund, with reflexed margins, pure white with few radiating lines near the base; column-wings rounded, sharply serrate on the upper margin; anther with a long beak surmounting the column. May, June, Oct. Guiana. B.M. 2819. J.H. III. 28:7. A.F. 6:633.

AA. *Anther not rostrate*.

B. *Petals spotted or blotched*.

c. *Labellum glabrous*.

Mackaii, Hook. Fig. 4056. Pseudobulbs large, ovate: lvs. many, linear-lanceolate, 1 ft. long: scape 18 in. long, bearing 5 or 6 large fls.: sepals and petals dingy yellowish green, with blotches of purple on the inside, lanceolate, acute, erect, spreading, all united toward the base; labellum large, rounded, emarginate, white with radiating vein-like deep blue lines, glabrous. Brazil. B.M. 2748. B.R. 1433 (as *Eulophia Mackaiana*). P.M. 3:97. L.B.C. 17:1664. J.H. III. 33:295. G.M. 53:1037.—This is distinguished from *Z. intermedium* and *Z. crinitum* by its smooth labellum and narrower lvs. Vars. *superbum*, *grandiflorum*, *majus* are also advertised. Var. *Charlesworthii*, Hort. Sepals and petals emerald-green, without purple markings. G.C. III. 51:83.

Gautieri, Lem. Pseudobulbs oblong-sulcate, 4 in. high: scape 2–3 fld.: fls. 3 in. across; sepals and petals green blotched with brown; labellum broadly reniform, deep purple at the base, white in front, sometimes nearly all deep purple with a darker crest. Autumn. Brazil. I.H. 14:535. Gn. 49:118.—The lvs. are fasciculate, narrowly oblong, keeled, 12–16 in. long: infl. shorter than the lvs.

maxillare, Lodd. Pseudobulbs 2 in. long: lvs. lanceolate, 1 ft. long: scape 9 in. long, 6-8-fld.: fls. $1\frac{1}{2}$ in. across; sepals and petals ovate-oblong, acute, green, with transverse brown blotches; labellum horizontal, purple, with a very large, glossy purple, notched horse-shoe-shaped crest, middle lobe roundish, waved, and obscurely lobed. Winter. Brazil. B.M. 3686. L.B.C. 18:1776. J.H. III. 33:295. P.M. 4:271.—Distinguished by its small fls. and very large crest.

cc. *Labellum pubescent*.

crinitum, Lodd. Habit of *Z. intermedium*: lvs. broadly linear-lanceolate: fls. on long, stout scapes; sepals and petals 2 in. long, oblong-lanceolate, green with rather few brown blotches; labellum 2 in. across, spreading, wavy, scarcely emarginate, white with purple veins radiating from the thick crest, disk hairy. Fls. at various times. Brazil. L.B.C. 17:1687. B.M. 3402 (as *Z. Mackaii* var. *crinitum*).—This has fewer brown blotches on the sepals and petals than *Z. intermedium*. There are varieties with pink, blue, or almost colorless veins on the labellum. Var. *cæruleum*, Hort., has the veins deep blue. G.M. 46:153; 50:59. J.H. III. 46:197.

intermedium, Lodd. Lvs. ensiform, $1\frac{1}{2}$ ft. long, $1\frac{1}{2}$ in. wide: scape longer than the lvs., bearing 5-6 fls. each nearly 3 in. across: sepals and petals oblong, acute, green with large, confluent blotches of brown; labellum rotund, narrowed at the base, deeply 2-lobed in front, pubescent, bluish white with radiating broken lines of purplish blue; column green and white. Fls. in winter. Brazil. R.H. 1873:190 (as *Z. Rivieri*).—Plants of *Z. Mackaii* are often cult. under this name.

DD. *Petals uniformly colored*.

Sedenii Reichb. f. Plants strong, with the scape, about as long as the lvs. and bearing several fls.: sepals

and petals deep purple-brown, bordered with green; labellum pale purple in front, becoming deep purple toward the base. F.M. 1880:417. Gt. 28:265.—A garden hybrid raised by Veitch.

Z. Armstrongiae = *Z. Mackaii* × *Z. rostratum*.—*Z. Ballii*, Rolfe. Fls. white, the sepals purple-tinged, the petals and lip blotched with bright rose-purple. G.C. III. 27:149. G.M. 48:365.—*Z. Burtii*, Benth. = *Huntleya*.—*Z. chloranthum*, Kränzl. Fls. small for the genus, greenish, fragrant, hairy inside.—*Z. cælestis*, Reichb. f. = *Bollea*.—*Z. discolor*, Reichb. f. = *Warszewiczella*.—*Z. Lallindei*, Reichb. f. = *Bollea*.—*Z. Patinii*, Reichb. f. = *Bollea*.—*Z. Prainianum*, Rolfe. Sepals and petals dusky brown, with obscure green stripes on petals; lip white, streaked with rose-purple. Peru. B.M. 8610.—*Z. Roeblingianum* = *Z. rostratum* × *Z. maxillare*. G.C. III. 34:227.—*Z. violaceum*, Reichb. f. = *Bollea*.—*Z. Wendlandii* Reichb. f. = *Warszewiczella*.

HEINRICH HASSELBRING.
GEORGE V. NASH.†

ZYGOPHYLLUM (*yoke leaf*, from the paired or opposite lfts. or lvs.). *Zygophyllaceæ*. Small often spiny twiggy shrubs or subshrubs, with stiff branches, of about 60 species in Eu. and Asia but mostly in S. Afr. and Austral., apparently not in the American trade but likely to be planted for ornament now and then by amateurs in the warmer and drier parts of the country. Lvs. simple or 2-foliate: fls. white or yellowish or red, on 1-fld. peduncles; calyx 4-5-parted; petals 4 or 5, clawed, twisted; stamens 8-10; disk fleshy and angled; ovary 4- or 5-celled, sessile; fr. an angled or winged caps. Prop. by seeds or cuttings. The species most likely to appear in collections are perhaps *Z. Fabago*, Linn., the Syrian bean-caper, with obovate lfts., copper-yellow fls., deep strong root and nearly or quite herbaceous top, S. W. Asia; *Z. Morgsana*, Linn., with obovate obtuse lfts., long yellow petals, and shrubby habit, from S. Afr.; *Z. spinosum*, Linn., with linear lfts., yellowish or whitish nodding fls., a small bush only 1-2 ft. high, from S. Afr.

SUPPLEMENT

Here are assembled certain lists and addenda that are supplementary to the body of the Cyclopedia, to provide the consultant with additional facilities for the use of the volumes. These appendices are as follows:

Collaborators in the making of the Cyclopedia	3555
Cultivator's guide to the articles	3562
Additional species	3565
New combinations in Latin names	3574
Finding-list of trade names	3575
Index to the six volumes	3611

Other articles of a similar character, providing keys and synopses, are printed in Vol. I, as follows:

Explanations, comprising a statement of the authorship of articles, nomenclature, pronunciation, spelling, the keys, abbreviations of botanical terms and expressions, books and periodicals to which reference is made, the authors of botanical names.	Page xi
Synopsis of the plant kingdom	(with index) 1-78
Key to the families and genera	(with index) 79-147
Name-list, comprising the English equivalents of Latin names of species	148
Glossary of the usual botanical and horticultural technical words	160
A fuller discussion of nomenclature will be found under "Names and Nomenclature," Vol. IV, 2098; also in the Finding-list	3575

For five years the work of compiling the Standard Cyclopedia of Horticulture has been actively under way. The present office was opened in March, 1912, but the organizing of the work had been started before that time. Although founded on the Cyclopedia of American Horticulture, completed in 1902, the present Cyclopedia is newly organized and newly written. Whenever the articles in the former work have been used as a basis, they have been brought down to date. The preface to Vol. I states the scope and intention of the present work.

The List of Collaborators (pages 3555 to 3561) comprises upward of 400 names, and many other correspondents have aided in less formal ways. To all these helpers the reader will extend his gratitude for the satisfaction he may find in any of the pages. The publishers, printers, artists, writers, and others have coöperated in the freest spirit.

If the consultant desires to know the office methods in compiling a work of this character, he may read the introductory account in Vol. IV of the former Cyclopedia, for the general details do not differ greatly between the two. The Editor gathers his force, finds himself a table and a very few simple accessories, supplies himself with writing materials and books, and then goes to work and holds to it through all the letters from A to Etc. If the reader finds a misplaced letter or accent mark, he may consider that each page comprises about 10,000 pieces of type metal, or more than 36,000,000 pieces for the entire work; these pieces are of many technical devices; and human eyes are fallible. In the first year or two of the work, the Editor was engaged otherwise and could give only small fragments of his time to the Cyclopedia.

If the reader desires statistics of such work, the following figures may interest him:

I. THE NUMBER OF ARTICLES.

Total number of entries or articles, including cross-references (the sub-articles are the independent articles or parts in the main articles and in the symposia, indicated by black-face lower-case type):

		Cyclo. Amer. Hort. 1902
Volume I	693	
Sub-articles	38	
	731	1,270
Volume II	1,101	
Sub-articles	29	
	1,130	1,263
Volume III	756	
Sub-articles	212	
	968	659
Volume IV	808	
Sub-articles	94	
	902	1,165
Volume V	650	
Sub-articles	64	
	714	
Volume VI	905	
Sub-articles	19	
	924	
	5,369	
Supplement (additional generic entries).	3	
	5,372	4,357

II. THE NUMBER OF PLANTS.

The number of genera entered:

		Cyclo. Amer. Hort. 1902
Volume I	422	820
Volume II	709	623
Volume III	442	351
Volume IV	550	461
Volume V	449	
Volume VI	639	
Supplement	3	
	3,214	2,255

The number of main species described or entered, in black-face type:

Volume I	1,801	2,924
Volume II	2,741	2,675
Volume III	1,512	1,405
Volume IV	1,901	1,789
Volume V	2,064	
Volume VI	2,372	
Supplement	102	

12,493 8,798

(3553)

The number of minor species-entries in the main articles, in italic type:

Volume I	267
Volume II	371
Volume III	270
Volume IV	436
Volume V	396
Volume VI	320
	2,060

The number of species in the supplementary lists, at the end of the various articles, in small italic type (including all but cross-references):

Volume I	985
Volume II	1,424
Volume III	533
Volume IV	993
Volume V	1,198
Volume VI	916
	6,049

Total species accounted for 20,602

The number of synonyms:

Volume I	1,715
Volume II	2,379
Volume III	1,558
Volume IV	1,727
Volume V	2,569
Volume VI	2,444
Supplement	66
	12,458

Cyclo. Amer.
Hort. 1902

The number of Latin-named varieties (of species) of all grades in main articles:

Volume I	820
Volume II	1,272
Volume III	795
Volume IV	1,031
Volume V	1,416
Volume VI	1,358
Supplement	23
	6,715

Cyclo. Amer.
Hort. 1902

Total Latin names accounted for (aside from a few new entries in the Finding-list in Supplement to Vol. VI)

III. THE NUMBER OF SPECIES (IN BLACK-FACE TYPE), NATIVE TO NORTH AMERICA NORTH OF MEXICO:

Volume I	353
Volume II	551
Volume III	358
Volume IV	427
Volume V	524
Volume VI	533
Supplement	7
	2,753

IV. THE DATES OF PUBLICATION:

Volume I	March 25, 1914
Volume II	July 22, 1914
Volume III	May 12, 1915
Volume IV	February 23, 1916
Volume V	October 4, 1916
Volume VI	March 28, 1917

Within the five years several horticulturists have passed away, whose biographies would have been proper subjects for entry in the Cyclopedia. Among such losses are C. E. Bessey, who died February 25, 1915; H. E. Van Deman, April 28, 1915; G. B. Brackett, August 2, 1915; Edwin Lonsdale, September 1, 1915; W. Atlee Burpee, November 26, 1915; William Tricker, July 11, 1916; William S. Lyon, July 20, 1916; Jackson Dawson, August 3, 1916; Ernest Walker, December 5, 1916; W. C. Barry, December 12, 1916.

To spend five years in a review of the vegetable kingdom, with all its marvels and its unsolved problems, is in itself a great privilege. If in addition one may see the applications to the desires of man, may hold associations with several hundred enthusiastic and competent correspondents, may have relations with the commercial and financial questions involved, and may at the same time catch some glimpse of the reaches of evolution and feel a new contact with the earth, the making of a Cyclopedia of this kind becomes not a task but an experience in life. The Editor hopes that the reader may share some of these prospects. The Editor is well aware of the shortcomings of the volumes and he would like to do the work all over again for the delight of it; but this reward must be left for other hands in the years that are to come.

Ithaca, New York,
February 1, 1917.

L. H. BAILEY.

COLLABORATORS

Comprising those persons who have aided in the making of the Standard Cyclopedia of Horticulture by the writing of articles, proof-reading, and the contributing of information.

*Means a contributor to the Cyclopedia of American Horticulture (1900-1902), whose name appears in the present work.

†Means contributor deceased since contribution was made for present Cyclopedia.

ETHEL ZOE BAILEY, EDITOR'S ASSISTANT

- ADAMS, GEORGE E., Prof. of Agronomy, Rhode Island State College, Kingston, R. I. (*Rhode Island, Rhubarb.*)
- ALDERMAN, W. H., Prof. of Horticulture, College of Agriculture, Morgantown, W. Va. (*Machinery, West Virginia.*)
- ALEXANDER, J. K., Dahlia Specialist, East Bridgewater, Mass. (*Dahlia.*)
- AMES, OAKES, Dir. Botanic Garden of Harvard University, Cambridge, Mass. (*Many genera of orchids.*)
- *ANDREWS, D. M. (*Opuntia.*)
- ANTHONY, R. D., Assoc. Horticulturist of State Experiment Station, Geneva, N. Y. (*Machinery.*)
- ARNOLD, GEO., Florist, Ensenore, N. Y. (*China Aster.*)
- *ATKINS, F. L. (*Platycerium.*)
- AUST, FRANZ A., Asst. in Landscape Design, College of Agriculture, Urbana, Ill. (*Herbs.*)
- BAILEY, HENRY TURNER, Teacher, Author, Editor "School Arts Magazine" and "Something-to-Do," North Scituate, Mass. (*Bouquet.*)
- BARCLAY, F. W., Head Gardener of Parks of Cincinnati, Cincinnati, Ohio. (*Ferns, Herbs, Hollyhock, and many genera.*)
- BARKER, MICHAEL, Sec. American Florist Co., 440 S. Dearborn St., Chicago, Ill. (*Cold-Storage, Vallota.*)
- BARNETT, CLARIBEL R., Librarian, U. S. Dept. of Agric., Washington, D. C. (*Aid on book-list.*)
- BARNHART, P. D., Horticulturist, Pasadena, Calif. (*Notes on California plants.*)
- BARRETT, O. W., Horticulturist of Canal Zone, Cristobal, Canal Zone. (*Canal Zone.*)
- BARRON, LEONARD, Editor "The Garden Magazine," Garden City, N. Y. (*Help on book-list, periodicals, etc., Rose.*)
- BARTLETT, H. H., Acting Asst. Prof. of Botany, University of Michigan, Ann Arbor, Mich. (*Help on Enothera.*)
- BATCHELOR, L. D., Assoc. Prof. of Plant-Breeding, Citrus Experiment Station, University of California, Riverside, Calif. (*Utah, Walnut in California.*)
- BAUR, A. F. J., Carnation Specialist and Sec. American Carnation Society, Indianapolis, Ind. (*Carnation.*)
- *BAYERSDORFER, H. (*Everlastings.*)
- BEACH, S. A., Prof. of Horticulture, Iowa State College, Ames, Iowa. (*Apple, Corn, H. A. Terry.*)
- BEADLE, C. D., Botanist and Horticulturist, Biltmore, N. C. (*Bamboo.*)
- BEAL, A. C., Prof. of Floriculture, New York State College of Agriculture, at Cornell University, Ithaca, N. Y. (*Cut-Flower Industry, Florists' Plants, John Craig, Pæonia [Diseases], Rose, Sweet Pea.*)
- *BEAL, W. J. (*Grass.*)
- BECKENSTRATER, HERMAN, Prof. of Pomology, Maryland State College of Agriculture, College Park, Md. (*Maryland.*)
- BENEDICT, R. C., Resident Investigator, Brooklyn Botanic Garden, and Editor "American Fern Journal," 322 E. 19th St., Brooklyn, N. Y. (*Botany of the ferns and their allies.*)
- BENNETT, E. R., Field Horticulturist, University of Idaho, Boise, Idaho. (*Colorado.*)
- BENNETT, IDA D., Writer, Coldwater, Mich. (*Home Flower-garden.*)
- BERCKMANS, L. A., Nurseryman, Augusta, Ga. (*Herbs, Lawns, Magnolia, Planting lists, Pomegranate.*)
- *BERCKMANS, P. J. (*Arboriculture, Magnolia, Pinckneya.*)
- †BESSEY, C. E., Prof. of Botany, University of Nebraska, Lincoln, Neb. (*Arboriculture, Evergreens.*)
- BETHUNE, C. J. S., Prof. of Entomology and Zoölogy, Ontario Agricultural College, Guelph, Ont. (*Wm. Saunders.*)
- BIOLETTI, FREDERIC T., Prof. of Viticulture, College of Agriculture, University of California, Berkeley, Calif. (*Grape, Olive.*)
- BLAIR, J. C., Head of Dept. of Horticulture, College of Agriculture, Urbana, Ill. (*Greenhouse Glass, Illinois.*)
- BLAKE, M. A., Prof. of Horticulture and Horticulturist of Experiment Station, College of Agriculture, New Brunswick, N. J. (*New Jersey, Peach.*)
- BOOTH, N. O., Prof. of Horticulture, Oklahoma Agricultural College, Stillwater, Okla. (*Oklahoma.*)
- †BRACKETT, G. B., Pomologist, U. S. Dept. of Agric., Washington, D. C. (*Aid on biographies.*)
- BRAINERD, EZRA, Ex-President Middlebury College, Botanist, Middlebury, Vt. (*Viola.*)
- *BRANDEGEE, MRS. KATHERINE. (*Leuchtenbergia, Pelecyphora.*)
- BRAUNTON, ERNEST, Landscape Designer and Consulting Horticulturist, 237 Franklin St., Los Angeles, Calif. (*Many notes on California plants.*)
- BRITTON, ELIZABETH G. (MRS. N. L.), Botanist, New York Botanical Garden, Bronx, New York City. (*Wild Flowers.*)
- BRODRICK, F. W., Prof. of Horticulture and Forestry, Manitoba Agricultural College, Winnipeg, Man. (*Manitoba.*)
- *BRUCKNER, NICHOL N. (*Culture of many of the ferns.*)
- BRUES, C. T., Asst. Prof. of Economic Entomology, Harvard University, Bussey Institution, Forest Hills, Mass. (*Arboriculture.*)
- BRUNS, H. N., Florist, 3042 W. Madison St., Chicago, Ill. (*Lily-of-the-Valley.*)
- *BURBANK, LUTHER. (*Nicotinia.*)
- *BUTZ, GEO. C. (*Carnation.*)
- CADY, LEROY, Assoc. Prof. of Horticulture, College of Agriculture, University of Minnesota, University Farm, St. Paul, Minn. (*Minnesota, several biographies.*)
- *CAMERON, ROBERT. (*Many cultural notes.*)
- CANNING, EDWARD J., Practical Landscape Architect, Northampton, Mass. For several years curator of the Smith College Botanic Gardens. (*Notes on culture of many plants and phases of gardening.*)
- CHASE, MRS. AGNES, Scientific Asst. in Systematic Agrostology, Bur. of Plant Ind., U. S. Dept. of Agric., Washington, D. C. (*Much help on the grasses.*)
- CHEYNEY, E. G., Dir. of the College of Forestry, University of Minnesota, University Farm, St. Paul, Minn. (*O. M. Lord.*)
- CHURCH, J. E., JR., Meteorologist of Agricultural Experiment Station, University of Nevada, Reno, Nev. (*Nevada.*)

- CLARK, JAMES C., Florist, Henry A. Dreer, 714 Chestnut St., Philadelphia, Pa. (*Adiantum*.)
- CLARKE, W. T., Prof. Agricultural Extension, University of California, Berkeley, Calif. (*California public-service agencies*.)
- CLEMENT, F. M., Prof. of Horticulture, Univ. of British Columbia, Vancouver, B. C.; formerly Dir. Horticultural Exp. Station, Vineland, Ontario. (*Grape, Quince*.)
- CLINTON, L. A., Agriculturist and Asst. Chief, Office of Extension Work, North and West, States Relations Service, U. S. Dept. of Agric., Washington, D. C. (*Soybean, Spurry*.)
- COCKAYNE, L., Botanist, Wellington, New Zealand. (*Veronica*.)
- COCKERELL, T. D. A., Prof. of Zoölogy, University of Colorado, Boulder, Colo. (*Helianthus, Sunflower*.)
- COIT, J. ELIOT, Prof. of Citriculture, College of Agriculture, University of California, Berkeley, Calif. (*Grapefruit, Lemon, Orange, T. A. Garey*.)

ZVOLANEK, ANT. C., Seed-grower, Lompoc, Calif. (*Sweet Pea in California.*)

CULTIVATOR'S GUIDE TO THE ARTICLES

The numerals refer to pages when the articles are not in the regular alphabetic sequence

The articles in the Cyclopedia are of four general classes: (1) cultural directions for the gardener, fruit-grower, vegetable-gardener, florist, and home planter; (2) identification, comprising the botanical accounts of genera, species and varieties; (3) general information about plants, comprising much of the introductory material in Vol. I and articles in the alphabetic text as Autumn Colors, Bull Horn, Color, Standards of Color, Cactus, Cloves, Education, Experiment Stations, Extension Teaching, Gums and Resins, Herbarium, Horticulturists, Horticultural Literature, Names and Nomenclature, Sap, Saprophyte, Transpiration, Variation, Xenia, and many others; (4) geographical articles, comprising British North America, Island Dependencies, North American States.

The identificational and informational articles appear, for the most part, in regular alphabetic order. The cultural directions, however, are in part contained in class articles of many kinds, inasmuch as they have only indefinite alphabetic designation. With each important generic entry, cultural directions will be found, as under Wisteria, Rhamnus, Ardisia, Pyrola, Ixora, Torenia, and the others throughout the six volumes; aside from these directions, however, are many others of special importance and interest, and these others are here listed and classified in such a way that the cultivator may have the range before him and be aided in finding the advice he desires.

1. Leading or important class articles of a cultural or plant-handling character.

Some of the leading class articles, dealing with the cultivation and handling of plants and products and with arrangement of plant materials, are as follows:

Alpine plants.	Fertility.
Annuals.	Fertilizers.
Ants.	Floral designs: see Designs, floral.
Aquarium.	Floriculture.
Aquatics.	Florists' plants.
Arboretum.	Flower-garden: see Kitchen-garden and flower-garden.
Arboriculture (symposium), comprising contributed parts on uses, insects and diseases, culture, transplanting, lists.	Forcing.
Autumn-gardening.	Forestry.
Bamboos.	Formal-gardening: see under Landscape gardening, 1793.
Banks.	Frost.
Basket plants.	Fruit-growing.
Bedding, or bedding-out.	Fumigation: see under Diseases and insects, 1044.
Bees.	Fungi.
Biennials.	Grafting.
Birds.	Grasses.
Bog-gardening; also page 2666.	Greenhouse and management (symposium).
Border.	Hedges.
Botanic garden.	Herbs (symposium), with lists.
Bouquet.	Horticulture.
Breeding of plants.	Hotbeds and coldframes.
Bulbs.	House plants.
Conifers; also page 358.	Insects: see under Diseases and insects.
Conservatory.	Inspection of horticultural merchandise.
Culinary herbs.	Irrigation, including sub-irrigation.
Cut-flower industry.	Japanese gardens: see under Landscape gardening, 1789.
Cuttings.	Kitchen-garden and flower-garden (symposium).
Design, floral.	Labels.
Diseases and insects (symposium), comprising extensive lists, also fungicides, insecticides, spraying.	Landscape gardening (symposium), including formal gardens, cemeteries, parks, lawn-making, and other parts.
Drainage.	Lawns: see under Landscape gardening, 1816.
Dwarfing.	
Electro-horticulture.	
Etherization.	
Evaporating fruit.	
Evergreens.	
Everlastings.	
Exhibitions (symposium).	
Ferns (symposium), with lists and culture.	

Lawn planting: see under Landscape gardening, Herbs, Planting, Arboriculture (see List No. 9, page 3564).

Layers.

Light for greenhouses.

Lists of trees (under Arboriculture), herbs (Herb, Herbs), shrubs (Planting); also under Ferns, Orchids, Palms.

Machinery and implements (symposium).

Manure.

Market-gardening.

Marketing.

Muckland-gardening.

Mushroom.

Nursery.

Nut-culture.

Nuts.

Orchids (symposium), comprising different parts; see also the culture under the alphabetic orchid entries.

Orchard: see Fruit-growing.

Packages.

Palms (symposium), comprising different phases of botany and treatment, with list of leading palms and their culture.

Park: see under Landscape gardening, 1801; also 2694.

Perennials.

Perfumery-gardening.

Pergolas.

Planting (symposium), comprising more than twenty articles on special phases of the work, with lists of shrubs.

Pollen, Pollination.

Potting.

Pruning.

Railroad-gardening.

Rock-gardening.

Rustic work: see under Planting, 2677.

Screens: see under Planting, 2681.

Seaside planting: see under Planting, 2670.

Seeds and seedage (symposium).

Shade-loving plants: see under Planting, 2695; 2700; under Herbs, 1467, 1472, 1473, 1475.

Shade trees: see under Arboriculture.

Soils.

Tillage.

Tillage machinery, 1942.

Drainage.

Mulching.

Irrigation.

Manure.

Fertilizers.

Lime, in horticulture.

Compost.

Peat.

2. Soil management; fertilizing; cover-crops.

Cover-crops.	
Legumes.	
Clover, Trifolium.	
Cowpea.	
Soybean.	
Velvet bean (Stizolobium).	
3243.	
Spurry.	
Rape.	

3. Insects, diseases, birds, weeds; frost; means of control.

Ants.	Pæonia diseases, 2433.
Insects, 1034.	Root-galls.
Bees.	Rusts.
Insect injury to trees, 364.	Smut.
Mites, 1041.	
Nematodes, 1041.	Birds.
Sowbugs.	Frost.
Rose insects, 3018.	Orchard protection against frost, 1284.
Diseases.	Weeds.
Diseases of trees, 368.	Insecticides, 1042.
Rose diseases, 3019.	Fungicides, 1027.
Fungi.	Fumigation, 1044.
Damping-off.	Spraying, 1057.
Mildew.	Spraying machinery and tools, 1956.
Molds.	

4. Propagation; breeding.

Seeds and seedage.
Cuttings.
Grafting.
Budding, 1364.
Inarching, 1370.
Layers, propagation by, 1831.
Pieces, grafting.
Roses, prop., 3004.

Rhododendron, prop., 2933.
Nursery.
Breeding.
Breeding, by seeds, 3134.
Hybridization, 552.
Pollination, 2734.
Dwarfing.

5. Marketing; transportation; inspection; exhibitions.

Marketing of horticultural produce.
Packages.
Storage.
Cold-storage.
Transportation.

Inspection.
Quarantine laws, 1650.
Exhibitions; of plants and flowers, 1190; of fruits, 1191; of vegetables, 1193.

6. Gardening; greenhouse; floriculture; florists' plants; flower-growing. (See List No. 9, on Landscape Gardening, etc.)

Autumn-gardening.
Basket plants.
Bedding.
Bog-gardening; also 2666.
Border.
Bouquet.
Flower-garden, 1747.
House plants.
Perfumery-gardening.
Railroad-gardening.
Rock-gardening.
Seaside-gardening, 2670.
Spring-gardening.
Stove plants.
Subtropical-gardening, 2669.
Succulents, culture of, 2672.
Wall-gardening, 2680.
Water-gardening, 2668.
Wild-gardening, 2663.
Window-gardening.

Nelumbium.
Nymphaea.
Nymphaoides.
Papyrus.
Victoria.
And others (see list, p. 2669).

Alternanthera (Telanthera), 3319.
Aster, China.
Astilbe, forcing of, 422.
Auricula.
Calla (Zantedeschia), 3534.
Carnation.
Chrysanthemum.
Cineraria.
Crotons, 815.
Dahlia.
Geranium (Pelargonium), 2525.
Gladiolus.
Gloxinia.
Heliotrope.
Hollyhock.
Hyacinth.
Lilies, cultivation, 1862.
Lily-of-the-valley, 1879.
Marguerite.
Melastoma.
Mignonette.
Muscari.
Narcissus.
Nepenthes.
Nephrolepis.
Nerine.
Nerium.
Nicotiana.
Peonia.
Pampas-grass.
Pancratium.
Pandanus.
Pansy.
Petunia.
Phlox.
Poinsettia.
Poppy.
Portulaca.
Primula.
Ranunculus.
Rose.
Roses under glass, 3014.
Salvia.
Scilla.
Selaginella.
Smilax, florists'.
Stocks.
Sunflowers, 1445, 3281.
Sweet pea.
Tuberose (Polianthes), 2731.
Tulip.
Verbena.
Viola, violet.
Wallflower.
Zinnia.
And many other regular entries.

Machinery and implements, 1939.
Labels, 1761.
Sterilizing soils, 3179.
Potting soils, 3178.
Pots and potting, 2777, 2778.
Osmundine.
Sphagnum.
Watering.
Winter protection, 2684.
Pruning.
Transplanting.

Greenhouse.
Light, for greenhouses, 1855.
Greenhouse implements, 1955.
Sub-irrigation in greenhouse, 1684.
Conservatory.
Hardy plants, forcing of, 1265.
Floriculture.
Florists' plants.
Cut-flower industry.
Hotbeds.
Forcing.

Alpine plants.
Annuals.
Bamboos.
Biennials.
Bignoniaceae, 502, 651.
Bromeliads, 503.
Bulbs.
Caoti; also Succulents, 2672.
Everlastings.
Ferns.
Ferns, tree.
Herbs.
Orchids.
Palm.

Water-gardening, 2668.
Aquarium.
Aquatics.

7. Vegetable-gardening and vegetables; sweet herbs, and the like.

Vegetable-gardening.
Market-gardening.
Muckland-gardening.
Kitchen-garden.
Vegetable-gardening tools and implements, 1953.

Irrigation for vegetable-growers.
Vegetable forcing-houses, 1400.
Vegetables, forcing of, 1254.
Cucumbers, forcing of, 1257.
Lettuce, forcing of, 1255.
Tomatoes, forcing of, 1259.

Artichoke.
Artichoke, Jerusalem.
Asparagus.
Asparagus, fertilizer for, 1227.
Beans.
Bean, fertilizer for, 1228.
Beet.
Beet, fertilizer for, 1225.
Sugar beets, fertilizer for, 1225.
Brussels sprouts.
Cabbage.
Cabbage and cole crops, fertilizer for, 1226.
Carrot.
Carrot, fertilizer for, 1226.
Cauliflower.
Celeriac.
Celery.
Celery, fertilizer for, 1227.
Chard.
Chayote (Sechium), 3124.
Chard, fertilizer for, 1225.
Chervil.
Chicory.
Chicory, fertilizer for, 1226.
Chives.
Cress.
Cress, fertilizer for, 1226.
Collards.
Corn.
Corn-salad.
Cucumber.
Cucumber, fertilizer for, 1227.
Cucumber, forcing, 1257.
Eggplant.
Endive.
Endive, fertilizer for, 1226.
Garlic.
Greens.
Horse-radish.
Kale.
Kohlrabi.
Leek, 1833.
Lettuce, 1846.
Lettuce, fertilizer for, 1226.
Lettuce, forcing, 1255.
Mangels, fertilizer for, 1225.
Melon.
Melons, fertilizer for, 1227.
Mushroom.
New Zealand spinach (Tetragonia), 3323.
Okra.
Onion.
Onion, fertilizer for, 1226.

Orach.
Parsley.
Parsnip.
Pea.
Pea, fertilizer for, 1228.
Peanut.
Pepper (Capsicum), 2545.
Physalis.
Potato.
Potatoes, fertilizer for, 1226.
Pumpkin and squash.
Pumpkins and pumpkins, fertilizers for, 1227.
Radish.
Radish, forcing, 1260.
Rhubarb.
Rockette.
Roselle.
Salsify; also, 3120.
Scorzonera.
Sea-kale.
Sechium (Chayote).
Shallot.
Skirret.
Sorrel.
Spanish salsify.
Spinach.
Spinach, fertilizer for, 1226.
Succory, 746.
Sweet potato.
Taro.
Tomato.
Tomato, fertilizer for, 1227.
Tomato, forcing, 1259.
Turnip.
Udo.
Watermelon, 2031.
Witloof.
Chufa.
Culinary herbs.
Fennel.
Fenugreek.
Mint, culture, 2035.
Sage.
Sampfire.
Savory.
Sweet cicely.
Sweet herbs.
Tansy.
Tarragon.
Vanilla.
Wormwood.
And other entries.

8. Fruit-growing; fruits.

Fruit-growing.
Nut-culture.
Russian fruits, 1297.
Fruits, forcing of, 1260.
Dwarf fruit trees, 1082.
Nursery.
Orchard tools, 1949.
Espalier.
Evaporating fruit.
Winter protection, 2684.
Pruning.
Transplanting.
Almond.
Apple.
Apple, fertilizers for, 1223.
Apricot.
Apricot, fertilizers for, 1224.
Avocado; see also Persea.
Banana.
Blackberry.
Blackberry, fertilizers for, 1224.
Blueberry.
Buffalo Berry.
Carob (Ceratonia), 717.
Cherimoya.
Cherry.
Cherry, fertilizers for, 1224.
Chestnut.
Citrange.
Citron.
Coconut.
Cranberry.
Cranberry, fertilizer for, 1225.
Currant.
Currant, fertilizer for, 1224.
Date.
Dewberry.
Feijoa.
Fig.
Gooseberry.
Gooseberry, fertilizer for, 1224.
Grape.
Grape, fertilizer for, 1225.
Grape, forcing of, 1261, 1388.
Grapefruit.
Guava.
Hazel-nut.
Hickory-nut.
Himalaya Berry.
Jaboticaba.
Jujube (Zizyphus), 3548.
Juneberry.
Kumquat.
Lemon.
Lime (fruit).
Limequat.
Litchi.
Loganberry.
Loquat.
Lucuma.
Mango.
Mangosteen.
Marang.
Monstera.
Mulberry (Morus), 2069.
Natal plum; see also Carissa.
Nectarine.
Nectarines, forcing of, 1263.
Olive.
Orange.
Orange, trifoliate (Poncirus), 2751.
Papaya.
Passiflora.
Peach.
Peach, fertilizers for, 1224.
Peaches, forcing of, 1263.
Pear.
Pear, fertilizers for, 1223.
Pecan.
Persimmon.
Persimmon.
Pineapple.

Pineapple, fertilizer for, 1225.
 Pistacia.
 Plum.
 Plum, fertilizers for, 1224.
 Pomegranate.
 Pot-fruits, forcing of, 1264.
 Prune.
 Pummelo.
 Quince.
 Quince, fertilizer for, 1225.
 Raspberry.

9. Landscape gardening; lawns and planting; herbs, shrubs, trees.

Landscape gardening.
 Landscape extension, 1813.
 Design, relation of planting to, 2657.
 Designing landscapes, 1783.
 Garden cities.
 Civic art, horticultural phases of, 1811.

Raspberry, fertilizer for, 1224.
 Sapodilla.
 Sapote.
 Shaddock.
 Spondias (Otaheite-apple).
 Strawberry.
 Strawberry, fertilizer for, 1224.
 Strawberries, forcing, 3270.
 Tamarind.
 Tangelo.
 Walnut.

Village improvement, 2658.
 Parks, landscape treatment, 1801.
 Parks, shrubs for, 2694.
 Cemeteries, landscape treatment of, 1807.
 Small grounds, 1796.

Topiary, and garden architecture, 2675.
 Formal gardening, 1793.
 Pergola.
 Japanese gardening, 1789.
 Woods, in landscape, 2662.
 Streets, shrubs for, 2694.
 Screen-planting, 2681.
 Seaside-planting, 2670.
 Walks, paths, driveways.
 Forestry.
 Botanic garden.
 Banks.
 Bog-gardening; also 2666.
 Rock-gardening.
 Winter-gardening, 2677.
 Subtropical-gardening, 2669.
 Planting.
 Windbreaks.

Lawns and lawn-making, 1816.
 Lippia for lawns, 1888.
 Zoysia, for lawns, 3549.

Shrubs and woody plants, lists of, 2690 for Northeast; 2693 for Middle West; 2695 for Midcontinental Region; 2696 for South; 2700 for California.
 Shrubbery, 2660.
 Vines for California, 2705.
 Trumpet-vines, 651.
 Vitis.
 Hedges.
 Osage orange for hedges, 1961.
 Privet for hedges, 1859.
 Azalea (Rhododendron), 2935.
 Lilac (Syringa), 3297.
 Evergreens.
 Arboretum.
 Arboriculture.
 Conifers, 358.
 Oak (Quercus), 2880.
 Pine.
 Spruces, ornamental, 2615.
 And many other entries under the generic names of trees and shrubs.

ADDITIONAL SPECIES

The first volume of this Cyclopedia was published in March, 1914. The lists of plants on which it was founded were brought down to the close of 1912, and it was to this date, as stated on page xi, that the Cyclopedia undertook to cover its task, although subsequent introductions have been inserted up to the closing of the pages so far as possible and as the information has come to hand. Undoubtedly some names were overlooked. Four years and more have passed since the original lists were prepared, and cross-referenced back and forth throughout the letters of the alphabet. Within this time, species have been introduced to cultivation within the United States and Canada, and which may now be described. The present list is not complete for the subtropical parts, and probably not all the introductions have been discovered for the other parts. The commerce in plants is incessant, and the situation is never at rest.

The consultant will probably be disappointed in not finding some of the well-advertised binomials in either the body of the Cyclopedia or this Supplement. The Editor has a long list of such names, but, without the plants themselves before him, he cannot know what the names mean. They are such as have no botanical standing, and the descriptions in the catalogues do not identify them. Probably some of these binomials represent generic and varietal names, with the species-name omitted. This is a prevalent but very faulty practice, as it obscures all relationships and plunges the subject into confusion. So long as this practice prevails, it is impossible to make clear identification of cultivated plants.

Only in one group does there appear to have been any marked extension of species, and this is in the willows (*Salix*). Some of the very attractive Chinese and other willows are very recently offered, and the account of that genus is therefore much extended. The additions in the willows are made by Alfred Rehder, as are also the additions and modifications in all the articles originally prepared by him.

ABIES. Page 172.

Delavayi, Franch. (*Keteleeria Fàbri*, Mast.). (After No. 11 in the treatment of Abies.) Tall tree, to 120 ft.: young branches yellowish or reddish brown, lustrous, usually glabrous: winter buds obtuse, resinous: lvs. spreading, crowded, usually blunt and emarginate, strongly recurved at the margins, silvery white below, $\frac{1}{2}$ –1 in. long: cones oblong-ovate to oblong-cylindric, usually truncate, deep violet, about $2\frac{1}{2}$ in. long; bracts usually slightly exserted. W. China. G.C. III. 39:212 (as *A. Fargesii* on p. 213).

Faxoniana, Rehd. & Wilson. (After No. 11.) Tall tree, to 120 ft.: young branches brownish villous: winter buds obtuse, very resinous: lvs. crowded, distichously spreading, linear, short-pointed or obtuse to emarginate, $\frac{1}{2}$ –1 in. long, silvery white beneath: cones ovoid or ovoid-oblong, usually truncate violet-purple, about $2\frac{1}{2}$ in. long; bracts exserted. W. China.

recurvata, Mast. (After No. 11.) Tall tree, to 120 ft.: young branches pale yellowish gray, lustrous, glabrous: winter bud slightly pointed, very resinous: lvs. crowded, spreading or recurved, sometimes falcate, pointed, bright green or glaucescent, of about the same color on both sides, about $\frac{1}{2}$ in. on fruiting branches, about 1 in. long and more pointed on young plants: cones oblong-ovoid, usually flattened at the apex,

violet-purple before maturity, later gray-brown, about 3 in. long; bracts not exserted. W. China.

squamata, Mast. (After No. 11.) Tall tree, to 120 ft.; bark purplish brown, exfoliating in thin flakes like the river birch: young branches brown, glabrous: winter buds obtuse, very resinous: lvs. very crowded, ascending, mucronate or obtuse, often falcate, glaucous below while young, becoming nearly green, $\frac{1}{2}$ –1 in. long: cones oblong-ovoid, obtuse, violet, 2–3 in. long; bracts slightly exserted. W. China. G.C. III. 39:299. —Very remarkable for its bright purplish brown bark, scaling off in thin flakes. It has violet-purple resinous cones, and short relatively broad leaves.

ALEURITES. Page 245.

montana, Wilson, is a new wood-oil tree recently intro. from China, and related to *A. Fordii*, but with the staminate and pistillate fls. tending to be in separate infl., the latter racemose and the fr. egg-shaped with 3 longitudinal and many transverse ridges.

AMPELOPSIS. Page 278.

Watsoniana, Wilson (*Vitis leoides*, Veitch, not Planch.). (After No. 10.) Tall climbing shrub, with slender forked tendrils, glabrous: lvs. simply pinnate; lfts. 5, stalked, ovate to ovate-oblong, acuminate, rounded at the base, remotely serrate, bright green above, glaucescent beneath, 3–4½ in. long: fls. and frs. not known, but probably not much different from those of *A. leoides* to which this species is closely related, but easily distinguished by the always simply pinnate lvs. with fewer and larger lfts. Cent. China. J.H.S. 28:295, figs. 95, 96, erroneously cited under *A. leoides* on p. 278 of this work.

ANGOPHORA. Page 288.

intermedia, DC. (*Metrosideros floribunda*, Smith, not Hort.). Tree, described by Benthams as having rough persistent fibrous bark, the parts nearly or quite glabrous: lvs. lanceolate to ovate-lanceolate, distinctly stalked, 2–4 in. or more long, sharply acuminate: fls. rather small, in loose corymbs or trichotomous panicles; calyx about 2 lines long or longer, with 5 prominent ribs, the teeth short-subulate. Austral.—In Calif. said to be a very fine drought-resisting shade and avenue tree.

lanceolata, Cav. Described in Calif. as a medium-sized white-fl. tree; by Benthams said to be "a tree of considerable size," with bark deciduous in large smooth flakes, the parts glabrous or essentially so: lvs. lanceolate, acuminate, 3–5 in. long, distinctly petiolate, with numerous parallel pinnate veins: fls. in rather dense terminal clusters, larger and denser than in *A. intermedia*; calyx about 3 lines long, the teeth shorter and thicker than in *A. intermedia*. Austral.

AQUILEGIA. Page 339.

akitensis, Huth. St. erect, branched above: radical and lower cauline lvs. twice ternate, uppermost cauline lvs. simple, narrowly lanceolate: sepals oval, longer than the limb of the petals, pale purple when dry; petals with a rather straight spur, limb subtruncate, pale yellow. Japan; intro. as an alpine species, with blue-and-yellow fls.; the author of species does not state its relationships.

ARGYRÆIA. Page 391.

splendens, Sweet (*Convolvulus splendens*, Hornem. *Lettsomia splendens*, Roxbg. *Ipomœa splendens*, Sims). Described by Clarke as "a large climber:" lvs. elliptic and acuminate, never cordate but the base rhomboid or rounded, blade about 7 in. long and petiole 3 in., glabrous above and silky beneath; fls. rose-colored or pale red, in few- or many-fl. pedunculate corymbs; corolla tubular-campanulate, $1\frac{1}{2}$ in. long, the plaits hairy outside; sepals tomentose, ovate and obtuse, $\frac{1}{4}$ in. long; caps. scarlet, papery. India. B.M. 2628.—Doubtful whether known in this country. The plant in cult. as *Convolvulus splendens* may be a form of the common morning-glory, *Ipomœa purpurea*.

BÉRBERIS. Page 487.

Regeliâna, No. 2, Fig. 539, represents *B. amurensis* rather than *B. Regeliana*, which is probably better considered a variety of *B. amurensis*, and to be called *B. amurensis* var. *japonica*, Rehd.

lêvis, No. 24. The species described under this name is *B. atrocarpa*, Schneid. (*B. lêvis*, Hort., not Franchet). The true *B. lêvis* is not in cult.; it has more closely serrated lvs. and purplish black slightly bloomy fr., while the fr. of *B. atrocarpa* is jet-black.

Sargentiana, No. 25. The plant described is the true species, but the shrub cult. under this name is often *B. Juliânæ*, Schneid., which seems slightly hardier; it has the young branches yellowish and slightly grooved (terete and red while young in *B. Sargentiana*), shorter lvs. hardly exceeding $2\frac{1}{2}$ in., firmer and less reticulate beneath, elliptic bloomy frs. crowned by a short style, on pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in. long.

B. aggregata, Suppl. List. (page 492). Add as a synonym *B. brevpaniculata*, Hort., not Schneid.; the true *B. brevpaniculata* is not in cult.

B. Wallichiana, Suppl. List. The species cult. under this name and described here is *B. xanthoxylon*, Hassk., to which *B. Wallichiana* var. *latifolia*, Hort., and also *B. Knightii*, Hort., *B. macrophylla*, Hort., and *B. Wallichiana*, Hort., not DC., must be referred as synonyms. The true *B. Wallichiana*, DC., has elliptic lvs. of firmer texture and is not in cult., while the true *B. Wallichiana* var. *latifolia*, Hook f. & Thoms., belongs as a synonym of *B. Hookeri*, Lem.

BÉTULA. Page 497.

Var. **Prättii**, Burkill. (End of No. 3, *B. utilis*.) Lvs. nearly truncate at the base, more gradually acuminate, the secondary veins scarcely pilose, but the veinlets short-pubescent; scales of the catkins with very short lateral lobes. W. China.

álbo-sinénsis, Burkill (*B. utilis* var. *sinénsis*, Winkler). (After No. 3.) Tree, occasionally to 100 ft., with orange-red bark; branchlets glabrous, lustrous; lvs. ovate, acuminate, rounded at the base, sharply and doubly serrate, glabrescent beneath, with 9–10 pairs of veins, $1\frac{1}{2}$ –3 in. long; cones cylindric, $1\frac{1}{2}$ – $1\frac{3}{4}$ in. long; bracts glabrous, scarcely ciliate, slightly glandular; lateral lobes rounded, much shorter than the linear-lanceolate middle one. Cent. and W. China. Var. **septentrionalis**, Schneid. Branchlets distinctly glandular; lvs. beneath on the veins often silky and bearded. N. W. China.

Potaninii, Batal. (*B. Wilsonii*, Bean). (After No. 7.) Shrub, to 10 ft., usually with spreading and prostrate branches, in its native habitat often hanging down over cliffs; branchlets densely brownish pubescent; lvs. short-petioled, ovate, acute, rounded or cuneate at base, irregularly, often doubly serrate, with 13–20 pairs of veins, dark green above, densely brownish pubescent beneath, $\frac{3}{4}$ – $1\frac{1}{4}$ in. long; cones $\frac{3}{4}$ in. long; scales with the middle lobe at least twice as long as the rounded lateral lobes. W. China.

In *B. pendula*, No. 9, strike out var. *Tauschii* and its description and insert after the end of the paragraph:

japonica, Sieb. (*B. álba* var. *japonica*, Miq. *B. pendula* var. *Tauschii*, Rehd.). Tree: branchlets glabrous or more or less glandular; lvs. broadly or deltoid-ovate, acuminate, truncate or broadly cuneate, sometimes subcordate at the base, simply or doubly serrate, glabrous or puberulous beneath and sometimes bearded in the axils, 2–3 in. long; cone cylindric, its stalk $\frac{1}{4}$ – $\frac{1}{2}$ in. long; scales with the lateral lobes spreading or recurved, as long or longer than the middle one. Japan. S.I.F. 1:21. Var. **szechuanica**, Schneid. (var. *mandschurica*, Schneid., not Winkler). Tree with wide-spreading branches; lvs. rounded or broadly cuneate at the base, glabrous or nearly so, dull or bluish green above; lateral lobes of scales spreading, half as long as the lanceolate middle one. W. China.

BUDDLËIA. Page 585.

Fáruharii, L. Barron (*B. asiatica* $\times$ *B. officinalis*). (After No. 5.) Intermediate between the parents. Lvs. lanceolate, 4–6 in. long, white or yellowish white beneath; fls. pale mauve, fragrant, in slender spikes forming large terminal panicles to 1 ft. long; the spikes composed of stalked, 3–7-fl. clusters. Raised by R. & J. Farquhar & Co., Boston, in 1913. Gn.M. 21:155.

CALLISTÈMON. Page 630.

Other names, than those described in Vol. II are listed in California, but their botanical standing is in doubt. The best that can be done at present is to make the following statements:

coccineus, Muell. Similar to *C. lanceolatus* but lvs. smaller, 1– $1\frac{1}{2}$ in. long, pungently acute; midrib and nerve-like margins prominent but lateral veins inconspicuous; stamens $\frac{3}{4}$ –1 in. long, red, with yellow anthers; fr. strongly contracted at summit. Austral.

Cunninghamii, Koch. Listed in Calif.: "Lvs. extremely narrow. Growth low and compact." Botanically described as follows: Lvs. elliptical, wide-spreading, pale green, pellucid or sometimes roughish, marginal nerves and veins rather prominent, young lvs. reddish, somewhat silky; stamens scarcely 3 times longer than the petals. Austral.

floribundus pendulus. A trade name used in Calif. for an unknown form recently intro. from European gardens. Described as of compact growth with short slender drooping branches well covered with short broad and rather blunt lvs. Probably a form of *C. lanceolatus*.

hýbridus, DC. Described only from lvs. which are rigid, linear, almost pungent, and with marginal nerve.—Not recognized by recent authors. The plant offered in Calif. under this name is probably a garden hybrid from Eu.

C. robustus, and **C. splendens** are trade names used in Calif. for forms recently intro. from Eu. Their botanical status is unknown.

HARVEY MONROE HALL.

CÁSSIA. Page 680.

polyántha, Moc. & Sessé. Branches angled; lvs. about 12-paired, glabrous, spreading; lfts. petiolulate, 4 lines long, oval, mucronate; fls. paniculately subcorymbose, 9 lines diam.; calyx-segms. broadly ovate, mucronate; petals unguiculate, obovate; pod compressed, acute at both ends, 2 in. long, 6 lines broad. Mex.—In Calif. said to be a spreading shrub blooming freely and continuously; yellow.

CÉLSIA. Page 709.

Arctúrus, Jacq. Probably perennial, but sometimes perhaps annual or biennial, differing from *C. cretica*, among other things, in its long-pedicelled rather than

subsessile fls.: more or less woolly, especially below: lvs. all alternate, canescent beneath, short-petioled, lyrate, the terminal segm. large and oblong-obtuse with crenate margins, the later segms. smaller and ovate; cauline lvs. few, oblong and slightly clasping: fls. verbas-cum-like, yellow, the five spreading lobes obtuse, purple-hairy stamens deflexed and ascending. Crete. B.M. 1962.

CENTAURÆA. Page 712.

orientalis, Linn. (After No. 9.) Perennial, 3 ft., erect and branching, the branches sparsely cobwebby: lvs. coriaceous, glabrous or roughish, pinnatisect into lanceolate or linear divisions: heads yellow-fld. (said to be a red-fld. form), large, ovate; bracts of involucre pale or colored at tip, the intermediate or outer ones ovate and prominently pectinate. Caucasus region.—A handsome species, with long-stalked heads. Centaurea is a large genus, with many ornamental species, and other kinds than those described in the Cyclopedia are likely to come into the trade from time to time as flower-garden and border subjects.

CHÆNOMÈLES. Page 727.

japonica. It has been shown recently that Thunberg, when describing his *Pyrus japonica*, had the species now called *C. Maulei* in mind: therefore the name *C. japonica*, Lindl., must replace the name *C. Maulei*, and the species called here *C. japonica* must bear the name *C. lagenaria*, Koidzumi (*Cydonia lagenaria* Loisel.); and *C. cathayensis* should be a variety of it: Var. *cathayensis*, Rehd. (*C. cathayensis*, Schneid.). Lvs. narrower, lanceolate, pubescent beneath while young. Cent. China. H.T. 27:2657, 2658. Another variety is: Var. *Wilsonii*, Rehd. Lvs. covered beneath with a persistent fulvous woolly tomentum. W. China.

C. Maulei, Schneid., becomes *C. japonica*, Lindl.

CLÉMATIS. Page 787.

No. 14, *C. nutans*. Var. *thyrsoides* is now considered a distinct species and has been named:

C. Rehderiana, Craib (*C. nutans* var. *thyrsoides*, Rehd. & Wilson).

No. 28, *C. montana*, add: forma *platysépala*, Rehd. & Wilson. A form of *C. montana* var. *Wilsonii* with broadly obovate, rounded or truncate sepals: the fls. are very round in shape and appear at the same time as the lvs.

C. Gouuriana in the Suppl. List (page 798), add: Var. *Finétii*, Rehd. & Wilson. Achenes glabrous, orbicular-ovoid and compressed, dark brown.

CÔCOS. Page 812.

schizophylla, Mart. Trunk, 6-9 ft. high: lvs. 6-9 ft. long; segms. 30-40, linear, acuminate, 12-16 in. long: spadix up to 3 ft. long: drupe orange-red. Brazil.—Described as a strong-growing species, useful for planting out in Fla. and Calif.

CÔRNUS. Page 851.

Walteri, Wang. (After No. 13.) Tree, to 40 ft.: branchlets nearly glabrous: lvs. elliptic, acuminate, broadly cuneate at the base, sometimes nearly rounded, usually crisped at the margin, dark green above, pale green and with appressed hairs beneath, with usually 4 pairs of veins, 2-4 in. long: panicle corymbose, about 3 in. across; style club-shaped: fr. black, about ¼ in. across. Cent. China.—This plant has been confused with *C. Wilsoniana* which is apparently not in cult. and is chiefly distinguished by the whitish under side of the lvs. and the cylindric style.

Hémsleyi, Schneid. & Wang. (After No. 14.) Shrub, to 20 ft.: branchlets appressed-pubescent at first,

becoming glabrous and reddish brown or purple: lvs. ovate to ovate-elliptic, short-acuminate, rounded at the base, with 6-7 pairs of veins, whitish and appressed pubescent beneath, often with brownish hairs along the midrib and veins, 2-3 in. long: corymb umbel-like, 2-3 in. broad, slightly pubescent or with brownish woolly hairs; style cylindric: fr. ½ in. across, bluish black. W. China.

CRATÆGUS. Page 878.

coloradensis, A. Nels. (After No. 35.) Low tree, to 12 ft., with glossy brown, sparingly spiny branches: lvs. broadly oval to orbicular, acute, rounded or somewhat cuneate at the base, incisely and coarsely toothed, sparingly pubescent above, nearly glabrous beneath except pubescent on the midrib and veins, about 2 in. long; petioles rather short: corymbs many-fld.; pedicels and calyx-tube hirsute; stamens 10; styles usually 3: fr. subglobose, about ½ in. across, dark scarlet, with juicy pulp. Colo.

erythropoda, Ashe (*C. cerronis*, A. Nels.). (After No. 35.) Small tree, to 15 ft.: branchlets glabrous, purplish brown, spiny: lvs. elliptic-ovate or obovate, acute, abruptly narrowed at the base, incisely serrate and slightly lobed above the middle, lustrous and sparingly pubescent above, particularly on the veins, glabrous below, 1½-2½ in. long: corymb glabrous; stamens 5-8, with purple anthers: fr. subglobose, ½ in. across, brown. Colo.

saligna, Greene. (After No. 37.) Tree, to 20 ft., with spreading or drooping branches, spiny; branchlets bright red, glabrous: lvs. rhombic-elliptic to rhombic-lanceolate, acute or sometimes rounded at the apex, cuneate at the base, slightly hairy and dark green above, paler green and glabrous beneath, 1¾-2 in. long: corymbs glabrous: fls. ¾ in. across; stamens 20, anthers yellow: fr. globose, blue-black, ½ in. across, with 3-5 outlets. Colo. S.M. 491. B.B. 482.

CÛPHEA. Page 913.

zorullensis, HBK. (*C. tricolor*, Moc. & Sessé. *C. arvensis*, Benth.). Herb; branches compressed, viscid-pubescent; lvs. oblong-lanceolate, 2 in. long, ¾ in. broad, acute, base rotundate, both surfaces scabrous: peduncles solitary to ternate, alternate: calyx viscid-pubescent, tubular, ventricose below. Mex.—*C. zorullensis*, Hook. B. M. 5232 = *C. micropetala*.

Hookeriiana, Walp. (*C. floribunda*, Hook. & Arn., not Lehm. *C. Roëzii*, Carr.). Shrubby; branches elongate scabrous; lvs. oblong-lanceolate, acuminate, base attenuate to a rather long petiole, both surfaces somewhat shining, scabrous: calyx deflex-bowed, base obtusely, viscid-pubescent, spurred. Mex.

CYNOGLÓSSUM. Page 939.

nervosum, Benth. Plant hairy-pubescent, to 3 ft., perennial: lvs. many, nearly sessile, elliptic or oblong, acute, those on the st. 4 in. long and not prominently nerved, the radical ones narrow-oblong-lanceolate and with several pairs of strong nerves: fls. deep cobalt-blue, about ½ in. across, in many lax axillary and terminal racemes which are 3-6 in. long; corolla broadly campanulate with a short tube. Himalayan region. B.M. 7513, where it is said to be "the largest-flowered Himalayan Cynoglossum, and a very handsome plant."

CYPËRUS. Page 940.

adenophorus, Schrad. About 2 ft. high: culm glabrous: lvs. shorter than the culm, linear, carinate: umbel 9-14-rayed; umbellules 6-9-rayed; rays 10-20-spiked; spikelets linear-lanceolate, many-fld., 3 lines long, the infl. whitish green: fr. obovate, 3-angled punctate-scabrous. Brazil.—Useful for pots.

DÆMONOROPS. Page 951.

fissus, Blume. Lf.-segms. many and graceful, 6-8 in. long, lanceolate, subulate-acuminate, plicate, apex penicillate, often bifid; rachis aculeate: spadix erect, contracted: fr. ovoid-globose, about the size of a small cherry. Borneo.—Foliage described as bronzy green.

DECKÈNIA (after Karl von der Decken, German explorer of East Africa, killed in 1864 by the Somalis). Sometimes misspelled *Deckeria*: but there is a genus name *Deckeria* which, however, is regarded as a synonym of *Iriarteia*. *Palmaceæ*. One species, by some referred to *Acanthophœnix*, from the Seychelles, now intro. as a warmhouse palm. *D. nobilis*, Wendl., is a tall palm, reaching 100 ft. and more, and 1 ft. or more in diam.: lvs. pinnate, 10-12 ft. or more long, the sheath 3-6 ft. long and usually spiny; petiole about 1 ft. long, pale green and smooth; pinnae narrow, hairy beneath, bristly when young; midrib yellow: fls. monœcious, in 3's, the middle one female, the male with 9 stamens and minute perianth, the female with imbricate perianth: spadix with slender pendulous branches which are spiny at the base; spathes 2, spiny, seldom exceeding 1 ft.: fr. much compressed, ovoid-deltoid, $\frac{1}{2}$ in. long and $\frac{1}{4}$ in. thick, black turning to straw-colored.

DELPHINIUM. Page 975.

speciosum. The trade name may apply to a showy garden form of undetermined origin. *D. speciosum*, Bieb., to which the botanical name applies, is a tall gray-tomentose perennial of the Caucasus: st. angled, paniculate above: lvs. palmately parted, the segms. acute and cut, the lower segms. not divergent: spur incurved at the point, equaling the sepals; petals glabrous above; ovary tomentose. Caucasus region, Persia.—*D. speciosum glabratum* is said by Nicholson to be similar in growth and fls. to *D. cashmirianum*, but has larger infl. and the fls. have longer spurs; Himalaya.

DIANTHUS. Page 997.

marginatus. The trade name may represent a marginate or edged form of one of the common annual garden pinks; if *D. marginatus*, Poir., it is a perennial of Europe, with linear marginate lvs. and solitary white fls.; calycine scales or bracts acute and shorter than the calyx.

ÉLYMUS. Page 1111.

gigantæus, Vahl. GIANT SIBERIAN RYE-GRASS. A tall species resembling *E. condensatus*: spike 1 ft. or more long; glumes narrow below, subulate above, longer than the several florets; lemmas pubescent, awnless. Siberia.—Sometimes cult. as an ornamental.

EREMÛRUS. Page 1128.

turkestanicus, Regel. Plant about 4 ft. high, with very long and dense terminal raceme of reddish brown fls. with long-exserted stamens and white-margined perianth-segms.: lvs. broadly linear, acuminate. Turkestan.

EUCALÝPTUS. Page 1152.

álba, Reinw. (*E. platyphýlla*, F. v. M.). Related to *E. populifolia*, but lvs. much more variable, from lanceolate to broadly ovate or almost orbicular, acute to cordate at base, mostly 3 in. long: umbels in the axils and paniculate, 3-7-fld., pedicels short or almost none, angular: cap hemispherical, low: valves slightly protruding. Austral. Maiden, Crit. Rev. Eucal. 105, 106, 107.—Grown at Los Angeles.

EUPATÓRIUM. Page 1166, after No. 22 (but lvs. stalked).

serótinum, Michx. An attractive species, 4-8 ft. high, with grayish white numerous fls. in a broad

cymose infl.: branching, pubescent at least above: lvs. ovate-lanceolate, long-acuminate, 3-nerved, slender-petioled, sharp-serrate, the upper ones alternate: fls. 7-15 in the campanulate involucre, of which the bracts are obtuse or truncate. Minn., south and southeast.

EVÓDIA. Page 1185.

hupehénsis, Dode. (After *E. Henryi*.) Tree, to 60 ft.: lfts. 7-9, short-stalked, elliptic-ovate to elliptic-lanceolate, long-acuminate, rounded or rarely narrowed at the base, glaucescent or pale green beneath and glabrous or nearly so except villous in the axils of the veins, 3-6 in. long: infl. slightly pubescent, 4-8 in. broad: fr. beaked, yellowish gray, slightly hairy. Cent. China.

FÍCUS. Page 1229.

ulmifolia, Lam. (*F. sinuosa*, Miq.). Shrub, 9-15 ft. high: lvs. alternate, variable, very harsh, oblong, subentire, undulately lobed or coarsely toothed, sometimes deeply and narrowly lobed, acuminate, base rounded, 3-nerved, $3\frac{1}{2}$ -7 in. long, $2\frac{1}{2}$ - $3\frac{1}{4}$ in. broad: fr. axillary, solitary or in pairs, orange-red to purplish, ovoid to ellipsoid, about $\frac{1}{4}$ in. long. Philippines.

utilis, Sim. Large tree: lvs. elliptic-cordate, 6-10 in. long; 4-5 in. broad, obtuse, leathery; petiole thick, 2-4 in. long; stipules membranaceous, 4-6 in. long, $1\frac{1}{2}$ -2 in. broad, obtuse, yellowish with brown spots: fr. solitary or clustered, almost globos, pubescent. Natal and Zululand.—Used for the manufacture of native cloth and rough cordage.

GALÈGA. Page 1311.

bicolor, Hausskn. Perhaps a form of *G. officinalis*: lfts. oblong-linear rather than oblong-lanceolate, often retuse: raceme more lax or open: calyx-teeth mostly shorter than the tube rather than longer: standard deep blue, the wings and keel whitish blue. Mesopotamia.

GENTIÀNA. Page 1323.

tibética, King. A Himalayan species of which no close relatives from that region are described in this Cyclopedia, and which now appears as a name in the trade. Described by King as follows: st. very stout, erect, 18-in. high, simple: st.-lvs. 6 in. long, lanceolate, connate at base into a cylindric sheath, the uppermost sessile and whorled and forming an involucre to the infl.: fls. crowded in the uppermost axils, sessile; calyx tubular, membranous, truncate, split on one side, the mouth minutely 5-toothed; corolla nearly 1 in. long, tubular-funnel-shaped, the lobes 5, triangular with a triangular fold in each sinus: caps. included; seeds ellipsoidal.

HELICHRÝSUM. Page 1450, after *H. arenarium*.

angustifolium, DC. Subshrub, the many virgate sts. appressed-canescant: lvs. linear, odorous, margins revolute: fl.-heads in a compound lax terminal corymb, small, oblong-cylindric, the pale involucre with few imbricate scarious obtuse scales. S. Eu.—Said to be a good plant for edgings, with white foliage.

HIBÍSCUS. Page 1483.

The names *H. cruentus* and *H. Lambertianus* in lists are probably forms of *H. Rosa-sinensis*; however, the botanical species bearing these names may be described, as surety:

cruentus, Bertol. St. erect, unarmed: lvs. petioled, palmately 3-5-fid, base cuneate, lobes oblong, lanceolate, obtuse, obtusely crenate: fls. racemose, red, 2-3 or solitary; outer calyx half shorter than the inner, many-parted, the segms. lanceolate-linear, acuminate, inner deeply 5-fid, much larger, about 1 in. long; caps. ovate. Guatemala.

Lambertiānus, HBK. Herb. st. simple, 6 ft. high, aculeate, minutely pilose: lvs. petioled, ovate-lanceolate, acuminate, base rounded, serrate, hirsute and green above, below canescent-tomentose, 5 in. or more long; stipules linear-subulate: fls. axillary, solitary, pedunculate, large; calyx double, outer 11-parted, divisions linear, inner campanulate, 5-parted; corolla 5-parted, unequally oblong, apex rotundate, base cuneate. Venezuela.

ÍNULA. Page 1655, after *I. hirta*.

montāna, Linn. Perennial, with erect mostly 1-headed villous st.: lvs. lanceolate, entire, villous, the radical ones narrowed into petiole; outer involucre scales oblong-lanceolate and somewhat obtuse, the inner ones acute: achene hairy: plant about 1-1½ ft. high, the heads bearing many narrow yellow rays. S. Eu.

ÍRIS. Section Evansia, species 1-5, page 1669.

gracílipes, Gray. Rootstock slender and branched: lvs. 3-4, radical, linear and grass-like, becoming 1 ft. long; peduncle filiform, about the length of the lvs., 1-3-headed: fl. solitary and sessile in the scarious 1-lvd. spathe, lilac; tube exceeding the 3-angled ovary, the segms. obcordate-oblong, the exterior lobes glabrous; crest yellow; stigma 2-fid, cut. N. Japan.—Small plant, about 8 in. high, flowering freely in May.

JUNÍPERUS. Page 1728.

chinénsis var. **procúbens**, No. 11. Under this name apparently three different forms have been confused; these are:

chinénsis var. **japónica**, Vilm. (*J. japónica*, Carr.). A dwarf shrub with foliage mostly of the juvenile type; of this two forms are in cult.: Var. **japónica aurea**, Bean (*J. chinénsis* var. **procúbens aurea**, Beiss.). Of more spreading habit with a few long branches, the young growth golden yellow. Var. **japónica aureo-variegata**, Bean (*J. chinénsis* var. **procúbens aureo-variegata**, Beiss.). Of more compact and upright habit, the young growth variegated with golden yellow.

chinénsis var. **Sárgentii**, Henry. A prostrate form with long spreading stems, the lateral branchlets ascending, forming dense mats; lvs. on young plants almost all acicular and grass-green, on fruiting plants all or nearly all scale-like and bluish green. Japan.—As a ground-cover this juniper is one of the most valuable. Intro. in 1892 to the Arnold Arboretum by Sargent and subsequently distributed as *J. chinénsis* var. **procúbens**.

procúbens, Sieb. (*J. chinénsis* var. **procúbens**, Endl.). Low prostrate shrub with the branches ascending at the ends: lvs. bluish green or glaucous, all acicular, in 3's, lanceolate, pungent, with a broad white band above divided near the apex by the green midrib: fr. not known. Japan.—Closely related to *J. squamata* from which it may be distinguished by the branchlets being glaucous-white on the edges of the pulvini.

LÀRIX. Page 1823.

The hybrid between *Larix decidua* and *L. leptolepis* mentioned under *L. decidua* has been named **L. híbrida**. Its lvs. are much like those of the *L. leptolepis*; the mature branchlets are light brownish yellow and slightly bloomy.

LITHOCÁRPUS (literally stone fruit). *Fagáceæ*. The article Pasania (page 2479) is to be referred to this new entry, as Lithocarpus is the older name and is the tenable one under the rules (see note in Sargent, Pl. Wilson. III. 205). Of Lithocarpus the following species are known to be in cult:

densiflōra, Rehd. (*Pasania densiflōra*, Vol. V, p. 2479).

cleistocárpa, Rehd. & Wilson (*Quercus cleistocárpa*, Vol. V, p. 2890).

córnea, Rehd. (*Pasania cornea*, Vol. V, p. 2479).

glābra, Rehd. (*Pasania glābra*, p. 2479).

Hénryi, Rehd. & Wilson (*Quercus Hénryi*, p. 2890).

thalássica, Rehd. (*Pasania thalássica*, p. 2479).

LYSIMÀCHIA. Page 1935.

japónica, Thunb. Annual: st. slender and decumbent, simple, villous or pubescent, the apex erect; lvs. opposite, petioled, roundish and subcordate to ovate, obtuse, entire: fls. 1 or 2 in the axils, the peduncle shorter than the lvs. and reflexed in fr.; corolla ½ in. or less across, yellow, the gland-dotted segms. oblong. In moist places and about fields, Japan, China, India, to the Philippines.—Whether the creeping yellow-fl. plant listed under this name is the true *L. japonica* is apparently yet to be determined.

NEPHRÓLEPIS. Page 2131.

To supplement the original account of Nephrolepis, there are published herewith revised lists of varieties. The first list (A) represents the forms now growing in the living collection of the Brooklyn Botanic Garden (1916-1917). It may be accepted as accurate as far as it concerns the varieties of *N. exaltata*. With respect to the varieties of species other than *N. exaltata*, no assurance of accuracy can be given. The proper classification of the wild forms of Nephrolepis is one of the most difficult problems in fern taxonomy, and with the inclusion of horticultural forms the difficulty is increased. The second list of names represents those forms which it has not yet been possible to secure for cultivation at the Botanic Garden. They are listed here merely to make the list of named forms as complete as possible. Most of the list was published in "Horticulture," October 28, 1916, accompanied by names of originators.

Regarding the other forms, it may be said that for American florists the *Exaltata* group includes practically all forms of commercial value. All these would be classed as greenhouse forms. Most of the species and varieties other than *Exaltatas* are stove forms. A few, especially the forms of *N. cordifolia* (including *N. tuberosa*, a synonym), and *N. pectinata*, will stand as much cold as the *Exaltata* varieties. Many of them are worth a place in a collection, but in general they do not make the many-leaved bushy plants so much prized by the American grower.

It may be noted that a form of *N. cordifolia* is apparently invariably now being grown and offered in the United States as *N. exaltata*. The true *N. exaltata* is really a very different form, more like *N. bostoniensis*, but easily distinguished by its greater stiffness and fewer leaves. Another point of distinction between the *Exaltata* group and the other is that, with the exception of *N. exaltata* itself, none of this group is spore-fertile. Microscopic examination shows no fertile spores, but does show apparently abortive sporangia. It is practically useless, therefore, to attempt to raise these from spores. Notwithstanding this statement, it may be noted that several widely separated raisings have been reported in which the sporelings showed great variation, and it is not at all impossible that a fertile variety might develop from any one of the forms. Practically all the forms of other species (not *N. exaltata*) are spore-fertile, and may be readily raised in this way. In fact most of the new horticultural varieties in Group AA are reported as having originated from spores.

Finally, in Group AA, there are listed below a number of names for which no plants have been yet secured. They are probably mostly if not all of English origin, and likely to fall in the group of varieties of species other than *N. exaltata*.

A. *Nephrolepis exaltata* and its varieties.

B. Forms with once-pinnate foliage.

<i>exaltata</i> : tropics generally.	Harris.
<i>bostoniensis</i> .	New York.
Childs.	Randolphi.
Dreyeri.	Roosevelti.
Dwarf Boston.	Schultheisi.
Edmontonensis. (English.)	Scotti.
<i>falcata</i> . (There is also an English <i>falcata</i> .)	splendida.
Gretnai.	Teddy, Jr.
Giatrasi.	viridissima.
	Wagneri.
	Wanamakeri.

BB. Forms with twice-pinnate foliage.

Anna Foster.	Kingsessing.
Baby Pierson (parentage uncertain).	Mills.
Barrows.	Pieroni.
Clark.	Pieroni "improved."
<i>duplex bernsteili</i> .	robusta.
Elmsfordi.	Schilleri.
Fosteriana (same as Anna Foster).	Scholzeli.
	splendida.
	superbissima.

BBB. Forms with thrice-pinnate foliage (sometimes producing 2-pinnate forms).

Clark.	Pruessneri.
<i>elegantissima</i> .	Scholzeli (sport).
<i>elegantissima</i> "improved."	superior.
<i>elegantissima compacta</i> .	todeoides. (English.)
<i>elegantissima cristata</i> . (English.)	todeoides compacta. (Eng.)
<i>exaltata cristata</i> . (Eng.)	todeoides superba. (Eng.)
Galvestoni.	Verona.
<i>lycopodioides</i> . (English.)	Whitmani.
<i>muscosa</i> .	Whitmani "improved."
Pieroni compacta (elegantissima compacta).	Whitmani compacta.
	Wichersi.
	Wredii. (English.)

BBBB. Forms with 4-pinnate foliage.

Amerpohli.	Marshalli. (English.)
<i>dissecta</i> . (English.)	Marshalli compacta. (English.)
Goodii.	Neuberti.
" <i>gracillima</i> " (not certainly the original <i>gracillima</i> of Barrows).	pulcherrima. (English.)
<i>magnifica</i> .	Rochfordi. (English.)
	Smithi.

BBBBB. Forms with 5-pinnate foliage.

Craigi.	Willmotæ. (English.)
---------	----------------------

AA. *Nephrolepis* varieties and species other than *exaltata*.

<i>acuminata</i> .	Faulkneri. (English.)
<i>acuta</i> .	floccigera.
Barteri.	Golwigheriana (Zollingeriana.)
Bausei.	Hestoni. (English.)
<i>biserrata</i> .	Hestoni cristata. (English.)
<i>biserrata (davallioides) furcans</i> .	hirsutula.
<i>biserrata furcans minor (davallioides furcans minor)</i> .	hirsutula tripinnatifida.
<i>biserrata</i> var. (Undetermined form.)	<i>Longii</i> (=superba).
<i>canaliculata</i> . (English.)	Mayii.
<i>concinna</i> .	Mayii cristata.
<i>cordata compacta: cordifolia compacta</i> .	Mayii ornata.
<i>cordifolia compacta</i> .	pectinata.
<i>cordifolia gigantea</i> .	philadelphiensis.
<i>cordifolia elegans</i> .	philippenensis. (English.)
<i>cordifolia tessellata</i> .	pluma.
<i>crispata congesta</i> .	recurvata.
<i>davallioides: biserrata</i> .	rivularis.
<i>davallioides furcans: biserrata furcans</i> .	rufescens (=hirsutula).
Duffi.	rufescens amabilis.
<i>ensifolia</i> . (English.)	rufescens elegans.
<i>exalta</i> (=cordifolia).	rufescens tripinnatifida.
" <i>exaltata furcans</i> " = <i>biserrata furcans</i> .	<i>rugosa</i> . (English.)
" <i>exaltata grandiceps</i> " = <i>biserrata furcans minor</i> .	splendens.
<i>falcata</i> . (English.)	superba.
	tuberosa.
	tuberosa plumosa.
	undulata. (English.)
	washingtoniensis.
	Westoni.
	Wittboldii.
	Zollingeriana.

R. C. BENEDICT.

NESTRÔNIA (according to the author, derived from a Greek word for Daphne). Syn., *Darbya*. *Santalaceæ*. Native deciduous shrub closely related to *Buckleya* and differing chiefly in its axillary fls., tufts of hairs at the base of the stamens, simple stigma, and in its globose fr. without enlarged persistent sepals. It has no particular ornamental qualities, but is botanically interesting, as it is a parasitic shrub growing like *buckleya* on the roots of trees, chiefly on those of pines and oaks. For cult. see *Buckleya*. The only species is *N. umbellula*, Raf. (*Darbya umbellulata*, Gray. *Buckleya umbellulata*, Hieron.). Glabrous shrub, 1-3 ft., spreading by suckers: lvs. opposite, short-petioled, oval or ovate to elliptic-oblong, acute or obtusish, usually narrowed at the base, bright green, 1-2½ in. long: fls. 4-merous, diceious, apetalous, greenish white, small; the staminate slender-pedicelled in 3-9-fl., peduncled umbels; stamens 4, short; pistillate fls. solitary, on stalks ¼-½ in. long, with ovate calyx-lobes much shorter than the tube: fr. globose, about ½ in. across, purplish, bloomy, crowned by the remnants of the calyx-limb. May; fr. in June. Va. to Ga. and Ala. S.F. 7:75.

ALFRED REHDER.

NYMPHÆA. Page 2310.

ovalifolia. (After No. 4.) The plant called *Nymphaea ovalifolia*, as intro. into gardens in 1916, is from newly imported African seed, and was first raised by E. T. Harvey, of Cincinnati. It is not the true *N. ovalifolia*, Conard. The new plant has more oval lvs. than *N. cerulea*, and larger and paler fls. It is to be regarded as a form of *N. cerulea*, deserving a personal name rather than a Latin name. In 1908 Gilg of Berlin described 6 new species of African water-lilies, all allied to *N. cerulea*. The new form here mentioned falls between *N. magnifica* and *N. spectabilis* of Gilg, having certain characteristics of both species.—The plant is "a prodigious grower, the lf.-stalks extending 10 or more ft." The fl. is "a rich cream color tipped with blue at the end of the petals." (Quotations from letters from Mr. Harvey.) Petals 20; stamens 92; carpels 21; sepals thickly marked outside with black lines and dots. Fl. 6-8 in. across. (Data from specimens furnished by Mr. Harvey.)

N. ovalifolia, Conard, Monogr. Nymph, 150, is from German E. Afr., apparently not in cult. Lvs. narrowly elliptic, with large irregular brown blotches above but plain green beneath: fls. deep blue, closed in dull weather.

H. S. CONARD.

PASANIA. Page 2479.

The oldest and tenable name for this genus is *Lithocarpus*, which is entered on page 3569. The species of *Pasania* in the supplementary list of *Quercus*, page 2890, are also to go into *Lithocarpus*.

PAVONIA. Page 2489.

hastata, Cav. St. pubescent: lvs. short-petioled, orbicular to oblong, sometimes deltoid, sagittate or hastate, dentate, somewhat tomentose beneath, pubescent above; stipules filiform; pedicels axillary and 1-fl., the involucre 5-bracted, the petals rose-colored and veined at the base with purple. Brazil.—Offered in Calif., as a small purplish-fl. shrub.

PELARGONIUM. Page 2532.

acerifolium, L'Her. One of the *Pelargium* section, allied to No. 20, inserted here because *Geranium citriodorum* is a name in the trade and the *G. citriodorum*, Cav., is considered to be referable to *P. acerifolium*: the species *P. acerifolium* is shrubby or subshrubby, 3-4 ft. tall, glaucous-green, differing from *P. angulosum* (of which Harvey makes it a variety) in having the lvs. more cuneate at base, more deeply lobed, and more scabrous. S. Afr.—Knuth, in his recent Monograph, keeps the species distinct.

PHILADELPHUS. Page 2581.

Add to *P. inodorus*: *P. gloriösus*, Beadle, is probably not specifically distinct from *P. inodorus*; it differs chiefly in the cup of the calyx being abruptly contracted at the base, not gradually narrowed into the pedicel.

PINÁNGA. Page 2626.

decóra, Lind. & Rod. Unarmed; trunk tall; sheaths, margin of petioles and nerves at first brown; lf.-segms tessile, broadly lanceolate, long-acuminate or sometimes with the apex bifid and rotundate. Borneo.

pátula, Blume. Trunk tall: lvs. unequally pinnatisect, 1-1½ ft. long, 9-14 in. broad; segms. falcate-lanceolate, acuminate, the uppermost with their apex truncate-dentate, and their base equally or unequally attenuate: spadix erect or pendulous, 2-3-fid: fr. ellipsoid, acute, obscurely striate. Sumatra.—Said to be a dwarf species as grown in pots and useful for conservatory. This and the above are recently listed.

PINUS. Page 2640.

After *P. sylvestris* var. *pumila* add: Var. *Wátereri*, Hort. (*P. Wateriana*, Hort.). Dense columnar form with steel-blue short lvs.

POTENTÍLLA. Page 2773.

Add to *P. fruticosa*: Var. *parvifolia*, Wolf (*P. parvifolia*, Fisch.). Lfts. usually 7, oblong-elliptic, glabrescent, ¼-½ in. long: fls. pale yellow, ¾-1 in. across. Cent. Asia, W. China, Himalayas. It may here be remarked that var. *Veitchii*, Bean, can scarcely be considered a hybrid of typical *P. fruticosa* and var. *dahurica* as formerly supposed, for it is now reported as common in Cent. and W. China, where var. *dahurica* has not yet been found; it was intro. in 1902, while var. *Friedrichsenii*, Rehd. (*P. Friedrichsenii*, Spaeth) was raised about 1895 in Spaeth's nursery from seed of var. *dahurica*; it differs from var. *Veitchii* in the yellowish fls. with narrower outer sepals, narrower and larger lfts. and pale, not lustrous brown stipules.

PTYCHORÁPHIS. Page 2856.

singaporénsis, Becc. (*Drymophlæus singaporénsis*, Hook. *Ptychosperma singaporénsis*, Becc.). Trunk low, about 4½ ft. high: lvs. about 5 ft. long, pinnately pectinate, segms. narrowly lanceolate, acuminate, about 8 in. long: spadices about 1 ft. long, simply branched from the base. Singapore.

RHODODÉNDRON. Pages 2938, 2942.

4. *R. arbutifolium*. Two species or hybrids are involved here. The synonyms *R. oleifolium* and *R. Wilsonii* should be eliminated. *R. arbutifolium* is probably a hybrid of *R. ferrugineum* and *R. carolinianum*. The lvs. are elliptic, not "to elliptic-lanceolate," and the size is 1½-2½ in. After *R. arbutifolium* insert:

lætévirens, Rehd. (*R. Wilsonii*, Hort., not Nutt. *R. Wilsonianum*, Hort. *R. oleifolium*, Hort., not Franch.). Probably a hybrid of *R. ferrugineum* and *R. minus*. Very similar to *R. arbutifolium*, but of slenderer, looser habit, with narrower and longer elliptic-lanceolate lvs. of a brighter green. This plant is generally cult. under the name *R. Wilsonii*, while the preceding one is known in English gardens as *R. arbutifolium*.

austrinum, Rehd. (*Azalea australis*, Small). (After *R. calendulaceum*, No. 35.) Shrub, to 10 ft.: branchlets pubescent and usually glandular: lvs. oval or obovate to oblong-spatulate, acute or mucronulate, finely pubescent, ciliate, 1-3½ in. long: fls. before the lvs., yellow or orange; calyx-lobes deltoid or triangular-lanceolate: corolla funnelform, about 1 in. long, the tube scarcely dilated up to the limb: lobes broad, acute: caps. finely glandular-pubescent. Fla.

RIBES. Page 2963.

In the Suppl. List under *R. Culverwellii*, strike out var. *wollense* which has turned out to be nothing but *R. divaricatum* (see Kew Bull. 1914:382).

SÁLIX. Pages 3052.

To No. 6, after var. *decipiens*, W. D. Koch (*S. decipiens*, Hoffm.) add: Var. *bullata*, Spaeth (*S. bullata*, Hort.). Forms a compact subglobose bush.

Between Nos. 6 and 7 insert:

rubens, Schrank (*S. alba* × *S. fragilis*. *S. Russelliana*, Smith. *S. viridis*, Fries). Intermediate between the parents. Tree; branchlets less fragile at the base than *S. fragilis*: lvs. silky when young, glabrous at maturity, intermediate in size: stalk of caps. longer than in *S. alba*. Occurs frequently between the parents. Var. *palustris*, Schneid. (*S. palustris*, Hort.). Silky pubescence of lvs. persisting.

To No. 7, add the following variety: Var. *calva*, G. F. W. Mey. (*S. alba* var. *cærulea*, Smith). Of pyramidal habit: lvs. larger, at maturity glabrescent, more bluish green above and more glaucous below.

After No. 7 insert:

hexándra, Ehrh. (*S. alba* × *S. pentándra*). Low tree; mature branchlets glabrous: lvs. lanceolate, green on both sides, silky at first, becoming glabrous: catkins like those of *S. alba*; stamens 4-6. In Eu., with the parents.

After *Salix* No. 17 insert several species and hybrids, as follows:

latifolia, Forbes (*S. Cáprea* × *S. myrsinifolia*). Shrub: branchlets pubescent: lvs. oval or obovate to oblong, usually acute, irregularly serrate, dark green and finally glabrous above, glaucescent and silky below at first, finally glabrescent: ovary thinly silky or partly glabrous. Occurs with the parents.

Erdingeri, Kerner (*S. Cáprea* × *S. daphnoides*). Tall, arborescent shrub: young branchlets short-pubescent, older branches glabrous: lvs. obovate-oblong to oblong, acuminate, usually narrowed at base, entire or slightly serrate, pubescent while young, nearly glabrous at maturity: ovary usually glabrous or thinly silky. Occurs with the parents. Var. *creménsis*, Rehd. (*S. creménsis*, Kerner). Closer to *S. Cáprea*: lvs. broader, more densely pubescent beneath: ovary silky.

Wimmeriana, Gren. & Godr. (*S. Cáprea* × *S. purpurea*). Shrub with upright branches: young branchlets sparingly short-pubescent, later glabrous, brown: lvs. oblong or obovate-lanceolate to lanceolate, acute, narrowed at the base, irregularly serrate, thinly silky-pubescent while young, later glabrous, dark green and lustrous above, glaucescent below: stamens connate at base; ovary grayish pubescent. Occurs with the parents.

cinèrea, Linn. Large shrub or small tree, to 25 ft.: 1- and 2-year-old branchlets tomentose: stipules often persistent: lvs. obovate or elliptic, acute or rounded, narrowed or rounded at the base, irregularly serrate, pubescent on both sides, 1½-2½ in. long: catkins sessile, before the lvs.; staminate ovoid; filaments pilose, free; pistillate cylindric; ovary pubescent; style very short or wanting. April. Eu., N. Afr., W. and N. Asia. Var. *oleifolia*, Reichb. (var. *angustifolia*, Doll). Lvs. elliptic-lanceolate.

Læstadiana, Hartm. (*S. cinèrea* × *S. lappònum*. *S. canescens*, Fries). Low or medium-sized shrub: young branchlets pubescent, older glabrous: lvs. obovate to oblong, acute or short-acuminate, narrowed at the base, irregularly serrate or entire, pubescent above, tomentose beneath: fls. before the lvs.; stamens sparingly hairy at the base; ovary pubescent; style to one-third as long as ovary. N. Eu. with the parents.

sórdida, Kerner (*S. cinerea* × *S. purpurea*, *S. Pontederàna*, W. D. Koch, not Willd.). Tall upright shrub: young branchlets tomentose, later glabrous, brown or yellowish: lvs. elliptic to lanceolate, acute, cuneate or rarely obtuse at the base, irregularly serrate, pubescent while young, later glabrous above, glabrescent and glaucous beneath: catkins on short, often leafy stalks; stamens usually connate one-half; ovary pubescent with short style. Eu. with the parents.

aurita, Linn. Shrub, 3-8 ft.: branches spreading, usually glabrous at maturity: stipules persistent, broad: lvs. short-petioled, obovate to elliptic, obtuse, usually rounded at base, irregularly dentate or nearly entire, pubescent on both sides or nearly glabrous above, glaucous beneath, 1-2, rarely to 3 in. long: catkins short-stalked or nearly sessile, a little before the lvs., the staminate broadly elliptic, with long filaments hairy at base; the pistillate cylindric; ovaries hairy; style very short or wanting. April. Eu., W. Asia to Altai Mts.

ambigua, Ehrh. (*S. aurita* × *S. repens*). Shrub, about 3 ft., with creeping st.: branchlets glabrous: lvs. elliptic to lanceolate, somewhat rugose, pubescent, later glabrescent above, about 1 in. long: catkins a little before the lvs.; ovary pubescent; style rather long. In Eu. with the parents.

ludificans, White (*S. aurita* × *S. phylicifolia*). Shrub: branchlets glabrous at maturity: stipules usually persistent: lvs. elliptic to narrowly obovate, crenulate, glabrous at maturity, glaucous beneath: catkins rather small, on leafy stalks, cylindric; ovary pubescent. N. Eu., with the parents.

sesquitértia, White (*S. aurita* × *S. phylicifolia* × *S. purpurea*). Intermediate in general appearance between *S. aurita* and *S. phylicifolia*: lvs. in shape like the former but with the nervation of the latter and nearly glabrous at maturity: stamens quite connate; ovary pubescent with slender style. Observed in England with the parents.

grandifolia, Ser. (? *S. appendiculata*, Vill.). Shrub, to 10 ft., with spreading branches: branchlets tomentose while young; stipules often conspicuous, semi-cordate: lvs. oval to obovate-lanceolate, acute, cuneate or rounded at the base, crenately serrate, glabrous at maturity except the pubescent midrib beneath, dark green above, light green or glaucescent and reticulate beneath, 2-6 in. long: catkins before or with the lvs. on short stalks with small bract-like lvs.; stamens hairy below; ovary long-stalked, pubescent; style short. Higher mountains of Cent. and S. Eu.

neriifolia, Schleich. (*S. grandifolia* × *S. purpurea*, *S. Pontederàna*, Schleich., not Willd. *S. austriaca*, Kerner). Shrub, to 6 ft., with upright slender branches: young branchlets pubescent, later glabrous, greenish or brown: stipules rather narrow: lvs. obovate-lanceolate to lanceolate, acute, serrulate, glabrous at maturity, glaucescent and reticulate beneath, 2-3 in. long: catkins shortly before the lvs.; filaments more or less connate; ovary stalked, pubescent, with very short style. Cent. Eu. with the parents.

myrsinifolia, Salisb. (*S. nigricans*, Smith. ? *S. spadicæa*, Chaix). Shrub, to 12 ft.: branchlets hairy or glabrescent, dull: stipules often rather large, subcordate: lvs. varying from elliptic, or rarely suborbicular to oblong-obovate or broadly lanceolate, usually acute, rounded at the base, serrate to nearly entire, glabrous or glabrescent above, more or less pubescent beneath, 1-3 in. long, usually blackish when dried: catkins with or a little before the lvs., short-stalked, bracted or leafy at the base; staminate rarely exceeding $\frac{3}{4}$ in.; pistillate cylindric; ovary stalked, usually glabrous, style slender. Eu., W. Asia to Kamchatka.—A very variable species.

tetrápia, Smith (*S. myrsinifolia* × *S. phylicifolia*). Intermediate between the closely related parents. It can best be recognized by the combination in various degrees of the characters of the two species which are chiefly the duller and more pubescent branches and lvs. and the larger stipules of *S. myrsinifolia* and the more shining and glabrous branches and lvs. and the smaller stipules of *S. phylicifolia*. Occurs in Eu. between the parents.

phylicifolia, Linn. (*S. bicolor*, Ehrh.). Upright shrub, to 3 or rarely 8 ft., with stiff and rather short branches: branchlets glabrous, polished: stipules small, caducous, or wanting: lvs. short-petioled, elliptic or elliptic-oblong, acute, rounded at base, nearly entire or minutely crenate-serrate, glabrous at maturity, yellowish green and glossy above, glaucous beneath, 1-3 in. long, not black when dried; catkins before or with the lvs., on short leafy stalks; ovaries pubescent or sometimes glabrous, stalked; style rather long. N. and Cent. Eu., N. Asia.

To Salix, No. 24, add: Var. **Gmelinii**, Anderss. (var. *songarica*, Regel). Fls. with the lvs.; ovary sessile, obtuse with a short and thick style and long stigmas. Russia, N. and Cent. Asia.

After Salix, No. 24, insert three:

stipularis, Smith (*S. cinerea* × *S. viminalis*, *S. holosericea*, Willd.). Shrub or small tree: branchlets long and stout, persistently pubescent: lvs. lanceolate to oblong-obovate, acute or acuminate, irregularly serrulate or crenulate, hairy on both sides, more densely beneath, 3-7 in. long: catkins before the lvs., short-stalked or nearly sessile; stamens very long; ovary stalked, pubescent, with short style and slender stigmas. Eu., N. Asia, with the parents.

daphnoides, Vill. Tall shrub, to 30 ft., rarely tree: branchlets yellowish or brownish, bloomy, glabrous: stipules cordate: lvs. short-stalked, lanceolate, acuminate, glandular-serrulate, glabrous, glaucescent beneath, $1\frac{1}{2}$ -3 in. long: catkins sessile, before the lvs.; staminate nearly 2 in. long, filaments sometimes united at the base; pistillate rather shorter; ovary short-stalked, glabrous, with long style. N. and Cent. Eu., N. and Cent. Asia.

acutifolia, Willd. (*S. daphnoides* var. *acutifolia*, Döll). Closely related to the preceding species: branchlets darker colored, more bloomy: stipules lanceolate, lvs. narrower and longer, lanceolate to linear-lanceolate, long-acuminate: catkins smaller. Eu., N. Asia.

After Salix, No. 27, insert three:

Piperi, Bebb. Shrub, to 20 ft.: branchlets glabrous, dark brown: lvs. elliptic-oblong, obovate or oblanceolate, acute, undulate crenate or nearly entire, glabrous, glaucous beneath, 4-6 in. long: catkins sessile or short-peduncled; stamens united or free at base; ovary smooth; style rather long. Wash.

hastata, Linn. Shrub, to 6 ft., young branchlets pubescent, older glabrous, brown: stipules often very large, obliquely ovate: lvs. elliptic or ovate, acute, glabrous, irregularly serrulate, $1\frac{1}{2}$ -2½ in. long: catkins with the lvs., in leafy stalks; filaments glabrous; ovary glabrous, style rather long. Eu., N. and Cent. Asia.

glabra, Scop. Low shrub, to 4 ft., with short, stout branches: young branchlets glabrous, brown: lvs. broadly oval or obovate to oblong, acute, rarely obtuse at the ends, minutely crenulate, glabrous, glaucescent beneath, $1\frac{1}{2}$ -3 in. long: catkins with the lvs., on leafy stalks: filaments pubescent at the base; ovary stalked, glabrous, style rather long. Cent. Eu.

After Salix, No. 29, insert two:

Reuteri, Moritz (*S. daphnoides* × *S. incana*, *S. Wimmeri*, Kerner). Tall shrub; young branchlets densely pubescent, older brown, glabrous, often bloomy: stipules small, lanceolate; lvs. lanceolate or narrowly

lanceolate, acute at both ends, serrulate, silky pubescent while young, glabrescent at maturity, dark green above, glaucescent beneath, $1\frac{1}{2}$ –3 in. long; catkins before the lvs., nearly sessile, cylindric; staminate $1-1\frac{1}{2}$ in. long; ovary short-stalked, glabrous, with short style. Cent. Eu., with the parents.

gracilistyla, Miq. (*S. Thunbergiana*, Blume). Shrub: young branchlets tomentose, older reddish brown: stipules cordate: lvs. oblong-obovate to oblong-lanceolate, acute at both ends, serrulate, pubescent when young, later glabrous above, thinly pubescent and glaucescent below with prominent veins, 2–4 in. long; catkins cylindric, before the lvs., sessile; staminate $1-1\frac{1}{2}$ in. long, stamens 2, with connate filaments; pistillate longer; ovary pubescent with long and slender style. Japan.

To Salix, No. 30, add the following varieties:

Var. **Lambertiàna**, W. D. Koch. Lvs. broader, generally obovate-lanceolate, more abruptly acuminate, usually more rounded at the base, up to 4 in. long and $\frac{3}{4}$ in. broad. Var. **sericea**, W. D. Koch. Lvs. silky when young, becoming glabrous. Here belongs the "Kecks Willow" (var. *Kécksi*, Hort.). Var. **amplexicaulis**, Boiss. Lvs. sessile or subsessile, cordate or rounded at the base, acuminate, oblong to oblong-lanceolate, glabrous.

After Salix No. 30 insert two:

rùbra, Huds. (*S. purpurea* × *S. viminalis*. *S. Forbyàna*, Smith). Small shrub: young branchlets short-pubescent, older glabrous: lvs. linear to lanceolate-oblong, acute or acuminate, denticulate, pubescent while young, later glabrescent: catkins subsessile, sta-

mens 2, with more or less connate filaments and red anthers; ovary short-stalked, pubescent, with distinct style. Eu., W. to N. E. Asia, with the parents.

Sieboldiàna, Blume. Upright shrub: young branchlets tomentose, older glabrous: lvs. ovate to oblong, acute, rounded at the base, obtusely serrate, dark green and glabrous above, glaucescent and glabrous below, pubescent only when young, 2–3 in. long; catkins cylindric, short-stalked, with small lvs. at the base; stamens 2, distinct or connate, or only 1; ovary stalked, pubescent, style half as long as ovary or shorter, with short oval stigmas. Japan.

SOLANUM. Page 3185.

gigantèum, Jacq. (next to No. 34). An erect shrub-like plant growing to a height of 10–25 ft.: sts. somewhat woody, thickly set with short, stout prickles and white-woolly with stellate pubescence: lvs. oblong or oblong-elliptical, narrowed at both ends, about 8 in. long by 3 in. broad, smooth above, and white-tomentose beneath: fls. cymose, pale violet or blue; calyx small, hoary, unequally 5-cleft; corolla about $\frac{3}{4}$ in. diam., rather deeply lobed; ovary puberulous: fr. red at maturity and about $\frac{1}{2}$ in. diam. India and Ceylon.—A tender species flowering under cult. when about 4 ft. in height. It is doubtful whether this species is in the American trade, although probably it is as ornamental as other species more or less grown. The *S. giganteum* of lists may be merely a trade name applied to one of the tall-growing species otherwise described under Solanum.

W. F. WIGHT.

NEW COMBINATIONS IN LATIN NAMES

When a species is transferred to another genus, and when a variety is transferred to another species or associated with another species-name or reduced from specific to varietal rank, the names follow them and a "new combination" results. Thus, if an author desires to place the almond in *Prunus* rather than in *Amygdalus*, in which Linnæus originally described it as *Amygdalus communis*, the new combination *Prunus communis* results. If *Ribes leiobotrys* of Koehne is considered by Zabel to be only a form of *R. aureum*, the new combination *R. aureum* var. *leiobotrys*, Zabel, results.

To enable botanists and bibliographers to record and trace the different dispositions and properly to understand the varying opinions of relationships, all such new combinations are entered whenever complete synonyms are made.

In the Cyclopaedia, it has been the desire to avoid the making of new combinations, as explained on page xi of Vol. I, although, under the exigencies of the work, a very small number has arisen. In Vols. V and VI, many combinations were inevitable, and these were duly published in *Rhodora*, XVIII, 152-160 (July, 1916); these were largely in the genera *Polyscias*, *Pyrus*, *Pæonia*, *Passiflora*, *Prunus*, *Statice*, *Limonium*, *Saxifraga*, *Tropeolum*.

A list of several incidental scattered new combinations made in the Cyclopaedia itself is here given, so far as desired, without histories, for the easy reference of the bibliographer. These are such combinations as the authors designed to make. Undoubtedly other combinations in the use of varietal names, and in the compilatory shift of other names, may be traced by those who have occasion to work over special groups; but these may not be considered here. The new combinations are mostly of horticultural varieties and of species-forms of minor importance. Numberless associations of varietal names cannot be traced to one definite source, as they are found in trade catalogues, periodicals, and other non-botanical publications, or may be customarily employed by horticulturists; these are therefore given the designation "Hort." (hortorum, "of the gardens," page xvii, Vol. I). In those cases in the Cyclopaedia in which no authority is given for varieties, "Hort." is to be understood.

The dates of the new combinations listed below are those of the publication of the six volumes: Vol. I, A-B, March 25, 1914; Vol. II, C-E, July 22, 1914; Vol. III, F-K, May 12, 1915; Vol. IV, L-O, Feb. 23, 1916; Vol. V, P-R, Oct. 4, 1916; Vol. VI, S-Z, March 28, 1917. It will be seen that most of the combinations are in the latter part of the alphabet, and among the names of woody plants. No new species have been described in the Cyclopaedia, and very few new varieties.

FINDING-LIST

Of Latin or Latinized binomials commonly used in North American literature and commerce, with their equivalents in the Cyclopedia, together with usages that the cataloguer may desire to follow

(Including a few changes and corrections)

This List is compiled primarily for the aid of Cyclopedia users, particularly the nurseryman, seedsman, propagator, planter, landscape architect, gardener, labeller, cataloguer, to place before him the commonest names in the catalogues and periodicals of North America and to give him the equivalents of these names. The information given in this List is all contained in the Cyclopedia; but it is more accessible when separated, being placed together in convenient form disconnected from keys and description and from names of plants known as yet only to collectors, students, and specialists. The attention of the consultant is called to the list of additional species beginning on page 3565, in the supplement to Vol. VI, representing trade names not in the body of the Cyclopedia.

The List represents practically the species now in the trade in North America in the usual temperate parts, although it does not pretend to be complete. It does not contain the many Latin names of horticultural forms that may appear in catalogues as species-names (the real species-name being omitted in parts of many trade-lists). Neither does it contain vernacular names: these will be found in alphabetic order in the Index to the Cyclopedia, beginning page 3611.

All generic entries are introduced by **BLACK-FACE CAPITAL TYPE** (name of the genus).

STATEMENT OF THE AMERICAN JOINT COMMITTEE ON HORTICULTURAL NOMENCLATURE

The American Joint Committee on Horticultural Nomenclature was established by the national organizations named below for the purpose of lessening the confusion, inconvenience, and losses which result to buyers and sellers of plants from the widespread use of different names for the same plant and of the same name for different plants.

The organizations participating, with list of committees, are as follows:

American Association of Nurserymen.—J. Horace McFarland, Harrisburg, Pennsylvania; Harlan P. Kelsey, Salem, Massachusetts; Henry Hicks, Westbury, New York; L. A. Berckmans, Augusta, Georgia; C. J. Maloy, Rochester, New York; Frederick V. Coville (Advisory), United States Botanist, Washington, District of Columbia.

American Association of Park Superintendents.—Herman W. Merkel, Forester Zoölogical Park, New York City; John Dunbar, Assistant Superintendent of Parks, Rochester, New York; Theodore Wirth, Superintendent of Parks, Minneapolis, Minnesota.

American Society of Landscape Architects.—Frederick Law Olmsted, Brookline, Massachusetts; Sid. J. Hare, Kansas City, Missouri; William Pitkin, Jr., Rochester, New York; Warren H. Manning, Boston, Massachusetts.

American Pharmaceutical Association.—Dr. H. H. Rusby, Columbia University, New York City; Oliver A. Farwell, Detroit, Michigan; Dr. Lyman F. Kebler, Washington, District of Columbia.

Ornamental Growers Association.—Harlan P. Kelsey, Salem, Massachusetts; C. J. Maloy, Rochester, New York; Thomas B. Meehan, Philadelphia, Pennsylvania; F. L. Atkins, Rutherford, New Jersey.

The representatives of the American Association of Nurserymen and of the Ornamental Growers Association organized as a Joint Committee in 1915, with J. Horace McFarland as Chairman and Harlan P. Kelsey as Secretary.

• The species-names in **black-face type** are in all cases those used in the Cyclopedia.

The primary or first-given entries under the genus in every case are the trade names or those used commonly in journals and elsewhere; when these names differ from the Cyclopedia name they are in *Italic type*; when the same as the Cyclopedia name, they are in **black-face type**.

A name in parenthesis is one that is used in the trade or in periodicals: thus, "*Acanthophoenix rubra* (Areca)" means that the plant may appear in catalogues under the name Areca. Such entries are cross-references.

The stars (*) denote the names recommended by the American Joint Committee on Horticultural Nomenclature for the use of nurserymen. These markings are made wholly on the responsibility of the Committee, the List being lent for this purpose, and they are not supervised or recommended by the Editor.

While it is desirable that the names used by botanists and horticulturists shall be the same, yet the dealer is confronted with trade conditions which may modify his practice in some cases. The Editor naturally prefers to stand for the accepted botanical names.

To save space, the abbreviation var. (variety) is omitted; but the Editor does not thereby commit himself to the use of trinomials.

At a meeting August 1, 1916, in which the representatives of the American Association of Park Superintendents and of the American Society of Landscape Architects also participated, the same officers were continued and the name American Joint Committee on Horticultural Nomenclature was adopted. The representatives of the American Pharmaceutical Association were added to the committee a few weeks later.

Scope of work.

So far as practicable, it is proposed to secure the standardizing of a single botanical name, together with a single vernacular or "common" name for every tree, shrub, and herbaceous plant in the American horticultural trade.

It is probable also that the Joint Committee will undertake later to recommend a list of *plant-name abbreviations*, as an aid to those who use plant names daily and continually, such as nurserymen, seedsmen, florists, landscape architects, pharmacists, park officials, and others.

The subjoined starred list of Latin binomials should be considered only as a preliminary report. The magnitude and manifest difficulties of the problem, and lack of time occasioned by the early publication of the last volume of this Cyclopedia, have made it necessary for the Joint Committee to confine its recommendations almost wholly to the "botanical" names of woody plants as given in this "Finding-List." The even more important work of endeavoring to standardize popular or "common" names must follow later.

Practical importance of stability in nomenclature.

The confusion of names in the horticultural plant world is at present so great as to clog popular plant knowledge and actually to limit to no small degree the use of certain trees, shrubs and flowers in our American plantings. The

consequent loss to the tradesman is obvious. For example, take the common Virginia creeper: We find this catalogued in 1916 under no less than six Latin binomials—*Ampelopsis quinquefolia*, *A. virginica*, *Parthenocissus quinquefolia*, *P. virginica*, *Vitis hederacea*, and *Psedera quinquefolia*, while as common names we have *Woodbine*, *American Woodbine*, *Virginia Creeper*, *American Ivy*, *Common Virginia Creeper*, *Virginian Creeper*, *Wild Woodvine*, and *Five-fingered Ivy*. Today both American and foreign nursery catalogues are filled largely with confused and contradictory lists of plant names, while popular books on gardening and horticulture and the horticultural press themselves are at sea, and little if any better off than the tradesman. It is thus often impossible for the buyer to know whether he will get what he has in mind when placing an order, or something entirely different.

Further, owing to the differing names under which both new and old plants are often catalogued, described, and disseminated, the plantsman and buyer become perplexed and discouraged, and proper interest is not awakened. This often results in the over-use of the commoner and less worthy trees and plants to the exclusion of many beautiful things.

Causes of confusion.

Even when there is complete and well-established agreement among botanists as to the classification and naming of any given plant, mistakes by nurserymen or dealers in identification and labeling are liable to occur, giving rise to much confusion. When a dealer, either through ignorance or accident, sends out a comparatively unknown plant labeled with the name of some other little-known plant, the misapplied name is apt to follow the first plant and become established in trade.

A striking case of this sort is that of the tree so widely disseminated for street planting under the common name "*Carolina Poplar*." Experts on the poplar state that this is probably *Populus Eugenei*, a hybrid originated in Europe, and that the native *Carolina Poplar* practically never passes in the trade under that name. In this extreme case the transferred name is so universally accepted by the trade that an attempt to correct the original mistake would be inadvisable at present.

When, however, a plant has been widely distributed under the name of some other plant, through a mere mistake in identification, and the plant whose name was mistakenly applied to the other is also in cultivation, there is serious confusion, which can usually best be settled by correcting the original mistake even if it has become widely accepted.

Other causes than mistaken identification of plants have contributed to the existing confusion. These involve differences of opinion and of practice among botanists in regard to plant names when there is no question at all about the identity of the plants. For one thing, in doubtful cases they are not yet wholly agreed upon the rules or "code" which shall apply, to decide which of two or more names shall stand; but these differences are comparatively few. Much more important are differences of personal judgment among botanists as to what constitutes in any given case a sufficient difference between two groups of related plants to place them in different genera, for example, whether the known difference between apples and pears is enough to separate them into two genera, *Malus* and *Pyrus*, or is so slight that they should be consolidated into a single genus. The same sort of difference in judgment arises as to what constitutes a sufficient difference to call for separation into distinct species, and as to what are of varietal rank. These differences are inevitable and are independent of rules or other arbitrary decisions.

For example, *Azalea* is now classed under *Rhododendron* by some botanists, yet for trade reasons it seems inexpedient to catalogue the *Azaleas* as *Rhododendrons*.

Probably the most important cause of changes in botanical nomenclature in recent years is the constant collection of new evidence as to the facts. This evidence

is of two sorts: evidence found in botanical literature as to the first proper description and naming of each kind of plant, and evidence as to the structure and habits of the plants themselves. When any group of plants is studied more carefully and thoroughly than before, new facts are sure to be discovered which may alter the classification and nomenclature based on previous incomplete or insufficient knowledge.

Absolute and permanent fixity of botanical nomenclature, therefore, cannot be insured by any arbitrary agreement at this time.

Remedy for the confusion.

For the practical convenience of those who use plants or deal in them there can and ought to be, however, a list of standard trade names for plants in commercial use, to be arbitrarily retained without change for a period of several years, regardless of any changes in the practice of scientific botanists. It is the hope of the Joint Committee that provision will be made for a regular periodic revision of this standard list, perhaps at the same decennial periods adopted by the United States Pharmacopœia Convention for revision of their standard nomenclature of drugs, which includes a large number of plant names. These revisions can bring the list into accord with changes which have become well established among botanists in the interval and the accepted changes can be made substantially at one time throughout the trade.

General adherence to the standard trade names as recommended by the Joint Committee will relieve horticulturists of the confusion directly chargeable to instability of botanical nomenclature and will remove the excuse for careless identification and mislabeling. *No agreement about names will cure troubles unless everyone is careful in the identification and labeling of the plants so as to avoid sending out the wrong plant under the right name.*

While the Joint Committee realizes that its recommendations are somewhat arbitrary, existing conditions make this inevitable. "Trade value" and stability have been guiding influences. The Joint Committee is not constituted to pass on undecided or critical questions of botanical nomenclature.

For a clearer understanding of the situation, the Joint Committee urges all who are interested in this subject to read the discussion under "Names and Nomenclature" in Vol. IV, page 2098, of the "Standard Cyclopaedia of Horticulture."

Basis of this report.

The Joint Committee has agreed that Latin names should conform so far as possible to good botanical usage, and that Bailey's "Standard Cyclopaedia of Horticulture" should be the basis of our technical name-list.

Only weighty reasons, as in the case of exceptionally well-established names or of existing trade names plainly more appropriate for business purposes, have led the Joint Committee to recommend the retention of trade names differing from the Cyclopaedia names. It is admitted that the Latin binomials as starred by the Joint Committee in the Finding-List are all too often at variance with the latest botanical usage. Subsequent revisions by botanists and the Joint Committee may make possible a more uniform standard list in which the botanists and the horticulturists will ultimately be brought together.

Common names.

As the work of the Joint Committee progressed it became increasingly evident that each cultivated plant should have a single and distinctive common name, which might readily become stable and fixed through acceptance by the horticultural interests of America.

The giving of an appropriate common name to a plant is permissibly much more arbitrary and the reasons for subsequently changing it less urgent than is often the case with Latin binomials. When a common name is given a plant new in cultivation it is often quite possible to make

it descriptive, euphonious, and short, in distinct contrast to many Latin names. Common names are usually easier to remember by those who are not botanists, and they serve a most useful purpose in linking up the plant with its correct or accepted scientific name. The Joint Committee expects in the near future to publish in connection with the scientific names a list of common names, with recommendations for horticultural use, believing that such a list will serve purposes of plant knowledge and identification even more effectively than the present starred list of botanical names.

Identification.

As has been stated, a leading cause of plant-name confusion lies in the careless dissemination of plants under a wrong name. In doubtful cases when means are not at hand for positively identifying plants and labeling them properly, it is earnestly urged that adequate specimens (including flowers, fruit, leaves, and roots, where possible) be sent to a competent authority for correct identification and naming, such as Dr. L. H. Bailey, Ithaca, New York; the United States Department of Agriculture, Washington; any well-equipped botanical garden; or the Arnold Arboretum, Jamaica Plain, Massachusetts. Specimens should be pressed and dried smooth, and sent flat between cardboards.

Acknowledgment.

The Joint Committee wishes to acknowledge its gratitude to Dr. Bailey for the opportunity afforded of presenting to the American horticultural public its first efforts toward standardizing plant names through the medium of the "Standard Cyclopedia of Horticulture." Moreover, the Committee has enjoyed the earnest coöperation and advice of Dr. Bailey, and thus the work has been made far more complete and helpful than it could possibly have been otherwise.

Recommendations of the Joint Committee on the use of the Finding-List.

1. The stars (*) denote the names recommended for uniform use by the American horticultural trade, for such period of time as shall elapse until a new list is agreed upon.

2. In cases in which the starred name differs from the Standard Cyclopedia name and the cataloguer or writer for any reason does not wish to use it, the Joint Committee urges the use of the Cyclopedia name rather than the use of a third alternative.

3. When no star appears in the list, as in the case of nearly all the herbaceous plants, the Joint Committee has not yet specifically passed on the names.

4. In cataloguing, the Finding-List will enable one to place other names in parentheses with the name recommended by the Joint Committee, and to use them also as cross-references. Customers seeking a plant will thus be enabled to locate it readily under any of its well-known names if cross-reference is freely used. The Joint Committee believes that there is no better method known of educating the tradesman and public alike to a correct knowledge of plant names and to the consequent adoption of the recommended or standardized name.

Examples: If he were cataloguing certain plants formerly known to systematists as *Andromeda*, a good treatment would be as follows:

Andromeda floribunda. See PIERIS.

And under *Pieris* the entry would be:

PIERIS (*Andromeda*) FLORIBUNDA.

(NOTE: The genus *Andromeda* is not entirely obsolete, but now includes in America only two species, *A. polifolia* and *A. glaucophylla*.)

In some cases, it is only the species that is involved, the genus remaining the same. Thus, the name *Magnolia stellata* is now used in place of *M. Halliana*. Perhaps the best entry would be:

Magnolia Halliana. See M. STELLATA.

And again in its proper place carrying description, sizes, and prices—

MAGNOLIA STELLATA (M. Halliana).

Other examples are

AZALEA NUDIFLORA (*Rhododendron nudiflorum*).

FRAXINUS NIGRA (*F. sambucifolia*).

HALESIA TETRAPTERA (*H. carolina*, *Mohrodendron carolinum*).

CORNUS STOLONIFERA var. FLAVIRAMEA (var. aurea).

ACER PALMATUM (*A. polymorphum*) var. ATROPURPUREUM.

These examples will suggest how to make up proper entries. It is further recommended that synonyms introduced in cross-reference or in parentheses always be printed in italics or in smaller type than the accepted standardized name.

5. In cataloguing, labeling, etc., the abbreviation "var." (variety) following a species name may be omitted for the sake of brevity.

The name of a variety or horticultural form is often further abbreviated by omitting the species-name (for example: *Acer purpurascens* for *A. pseudoplatanus* var. *purpurascens*); but this practice is liable to cause confusion, as when specific and varietal names in a given genus are similar or alike, and therefore when a varietal name is so contracted the abbreviation "v." or "var." should be retained (for example: *Acer* var. *purpurascens* for *Acer pseudoplatanus* var. *purpurascens*).

6. It is suggested that all tradesmen publishing catalogues or lists print in a conspicuous place a notice similar to the following: "The names of trees and shrubs in this catalogue are based on the recommendations of the American Joint Committee on Horticultural Nomenclature as they appear in Bailey's Standard Cyclopedia of Horticulture, pages 3575 to 3591."

The Joint Committee takes this opportunity to urge all members of the organizations represented in it and all others interested in standardizing plant names to offer criticisms and suggestions for the help and instruction of the Committee in its future work. It is only by persistent effort and coöperation that we may hope to bring reasonable order and understanding out of the existing chaos in plant nomenclature.

AMERICAN JOINT COMMITTEE ON HORTICULTURAL NOMENCLATURE

HARLAN P. KELSEY, *Secretary*,
Salem, Massachusetts.

ABELIA. **A. chinensis*.—**grandiflora*.—**rupestris*: **A. grandiflora*; also sometimes applied to *A. chinensis*.**ABERIA.** *A. caffra*.**ABIES.** *A. alba*: **Picea canadensis*; perhaps sometimes applied to *Abies Picea*.—**Alcockiana*: *Picea bicolor*; often applied to *P. jezoensis hon-doensis*: **Picea Alcockiana*.—**amabilis*; sometimes misapplied to *A. grandis*.—**arizonica*: *A. lasiocarpa arizonica*; by some regarded as a distinct species.—**baborensis*.—**balsamea*.—**brachyphylla*: **A. homolepis* is the oldest name for the fir known as *A. brachyphylla*; the *A. homolepis* mentioned on page 175 is *A. homolepis umbellata*.—**canadensis*: **Tsuga canadensis*.—**cephalonica*.—**cilicica*.—**concolor*.—**Douglasii*: *Pseudotsuga taxifolia*: **Pseudotsuga Douglasii*.—**excelsa*: **Picea excelsa*.—**firma*.—**Fraseri*.—**grandis*.—**homolepis*.—**lasiocarpa*.—**magnifica*.—**Mariesii*.—**Menziesii*: **Picea sitchensis*.—**Mome*: **A. firma* (the name *A. Mome* is a *nomen nudum*).—**nobilis*.—**Nordmanniana*.—**numidica*: **A. baborensis*.—**orientalis*: **Picea orientalis*.—**pectinata*: *A. Picea*.—**Picea*: **A. pectinata*.—**Pinsapo*.—**pungens*: **Picea pungens*.—**sacchalinenensis*.—**sibirica*.—**subalpina*: **A. lasiocarpa*.—**umbellata*: **A. homolepis umbellata*.—**Veitchii*.**ABOBRA.** *A. viridiflora*: *A. tenuifolia*.**ABRONIA.** *A. arenaria*: *A. latifolia*.—**umbellata*.—**villosa*.**ABRUS.** *A. precatorius*.**ABUTILON.** *A. megapotamicum*.—**Savitzii*: form of *A. hybridum*.—**striatum*, but the stock is likely to be *A. pictum*.—**Thompsonii*: *A. striatum Thompsonii*.—**veixillarium*: *A. megapotamicum*.**ACACIA.** **A. armata*.—**Baileyana*.—**Cavenia*.—**cultriformis*.—**cyanophylla*.—**cyclops*.**ACACIA**, continued.—**dealbata*: **A. decurrens dealbata*.—**decurrens*.—**Drummondii*.—**Farnesiana*.—**floribunda*: **A. longifolia floribunda*.—**Julibrissin*: **Albizzia Julibrissin*.—**juniperina*.—**latifolia*.—**longifolia*.—**lophantha*: **Albizzia lophantha*.—**melanoxylon*.—**mollissima*: **A. decurrens mollis*.—**Nema*: **Albizzia Julibrissin*.—**neriifolia*.—**podalyriæfolia*.—**pravissima*.—**pubescens*.—**pycnantha*.—**Riceana*.—**saligna*.—**verticillata*.**ACÆNA.** *A. microphylla*.**ACALYPHA.** **A. hispida*.—**Macafeana*: **A. Wilkesiana Macafeana*.—**marginata*: **A. Wilkesiana marginata*, not *A. marginata* of botanists.—**mosaica*: **A. Wilkesiana mosaica*.—**Sanderi*: **A. hispida*.—**triumphans*: **A. Wilkesiana triumphans*.**ACANTHOPANAX.** **A. pentaphyllum* (*Aralia*).—**ricinifolium* (*Aralia*).

By some authors, the name *Acanthopanax* is considered to be masculine, the specific names to end in *-us*; but the prevailing practice with English and American botanists is to regard the *Panax* combinations as neuter. These names should be pronounced *Acanthóp-anax*, *Oreóp-anax*, *Tetráp-anax*, etc.

ACANTHOPHÆNIX. *A. rubra* (*Areca*).**ACANTHORHIZA.** *A. aculeata*.**ACANTHUS.** *A. latifolius*: *A. mollis* latifolius.—**mollis*.—**spinosus*.**ACER.** **A. campestre*.—**circinatum*.—**colchicum*: **A. cappadocicum*.—**dasycarpum* (*Silver Maple*): *A. saccharinum*.—**ginnala*.—**glabrum*.—**Heldreichii*.—**japonicum*.—**macrophyllum*: sometimes used erroneously for *A. japonicum macrophyllum*.—**monsessulanum*.—**Negundo*.—**palmatum*.—**pennsylvanicum*.—**pictum*.—**platanoides*.—**polymorphum*: **A. palmatum*.**ACER**, continued.—**pseudoplatanus*.—**rubrum*.—**saccharinum*. This is the *Silver Maple*, commonly known in the trade as **A. dasycarpum*. Much of the stock listed as *A. saccharinum* is *Sugar Maple*, which is now known as *A. saccharum*.—**saccharum*. *Sugar* or *Rock Maple*, formerly known as *A. saccharinum*, but this name is now applied to *Silver Maple*.—**sanguineum*: **A. palmatum sanguineum*.—**Schwedleri*: **A. platanoides Schwedleri*.—**spicatum*.—**tataricum*.—**velutinum*: **A. insigne velutinum*; sometimes used erroneously for *A. Trautvetteri*.**ACERANTHUS.** *A. diphyllus* (*Epi-medium*).**ACHANIA.** *A. Malvaviscus*: *Malva-viscus arboreus*.**ACHILLEA.** *A. ægyptiaca*: *A. Tournefortii*.—**Ageratum*.—**aurea*.—**Eupatorium*: *A. filipendulina*.—**filipendulina*.—**Millefolium*.—**mongolica*: *A. sibirica*.—**Parmica*.—**tomentosa*.**ACHIMENES.** *A. Haageana*: *A. longiflora*.—**longiflora*.—**pateas major*.**ACHRAS.** *A. Sapota*.**ACHYRANTHES.** *A. acuminata*: *Iresine Lindenii*.—**Emersonii*: *Iresine Lindenii*.—**Herbstii*: *Iresine Herbstii*.**ACIDANTHERA.** *A. bicolor*.**ACONITUM.** *A. autumnale*.—**bicolor*: plants under this name are either *A. Napellus bicolor* or *A. sinensis bicolor*.—**Fischeri*.—**Lycotomum*.—**Napellus*.—**pyramidatum*: probably *A. pyramidale*, which is *A. Napellus*.—**pyrenaicum*: *A. Anthora*.—**uncinatum*.—**Wilsonii*: *A. Fischeri Wilsonii*.**ACORUS.** *A. Calamus*.—**japonicus*: probably a form of *A. gramineus*.**ACROCLINIUM.** *A. album*: *Helipterum roseum album*.—**roseum*: *Helipterum roseum*.**ACTÆA.** *A. alba*.—**rubra*: *A. spicata rubra*; better kept distinct, as *A. rubra* Willd.—**spicata*.**ACTINIDIA.** **A. arguta*.—**chinensis*.—**Kolomikta*.—**polygama*.

ACTINOLEPIS. *A. coronaria* (Shortia californica).
ADENANTHERA. *A. pavonina*.
ADENOPHORA. *A. lilifolia*: *A. communis*.
 — *Potaninii*.
ADIANTUM. *A. æmulum*: *A. cuneatum*.
 — *bellum*.
 — *Capillus-Veneris*.
 — *Croweanum*: *A. cuneatum* *Croweanum*.
 — *cuneatum*.
 — *Farleyense*.
 — *Fergusonii*: *A. Capillus-Veneris*.
 — *hybridum*: *A. cuneatum*.
 — *mundulum*: *A. cuneatum*.
 — *pedatum*.
 — *rhodophyllum*: a form of *A. tenerrimum*.
 — *Sanctæ-Catharinæ*: a form of *A. trapeziforme*.
 — *scutum*.
 — *trapeziforme*.
 — *Wiegandii*: *A. Wagneri*.
ADLUMIA. *A. cirrhosa*: *A. fungosa*.
ADONIS. *A. æstivalis*.
 — *amurensis*.
 — *autumnalis*.
 — *pyrenaica*.
 — *vernalis*.
ÆGOPODIUM. *Æ. Podagraria*.
ÆSCULUS. **Æ. californica*.
 — **carnea*.
 — **glabra*.
 — **Hippocastanum*.
 — *macrostachya*: **Æ. parviflora*.
 — **octandra* (Pavia).
 — **parviflora* (Pavia).
 — **Pavia* (Pavia).
 — *rubicunda*: **Æ. carnea*.
 — **turbinata*.
ÆTHEOPAPPUS. *Æ. pulcherrimus*: *Centaurea pulcherrima*.
ÆTHIONEMA. *Æ. coridifolium*.
 — *grandiflorum*.
 — *juncundum*: *Æ. coridifolium* (Iberis).
AGAPANTHUS. *A. umbellatus*.
AGATHÆA. *A. celestis*: *Felicia amelloides*.
AGATHIS. **A. robusta*.
AGATHOSMA. *A. Ventenatiana* (Diosma).
 — *villosa* (Diosma).
AGAVE. *A. americana*.
 — *atrovirens*.
 — *carulescens*: *A. lophantha*.
 — *ferox*.
 — *potatorum* (the more glaucous form of *A. Scolymus*; very likely something else is really offered under this name; see No. 12, page 233).
 — *stricta*.
AGERATUM. *A. album*: Probably *Eupatorium micranthum*.
 — *conspicuum*: *Eupatorium glechonophyllum*.
 — *Lasseauxii*: *Eupatorium Las-seauxii*.
 — *mexicanum*: *A. Houstonianum*.
 — *nanum*: probably a dwarf form of *A. Houstonianum*.

AGERATUM, continued.

— *Wendlandii* (identity uncertain; perhaps *Alomia* *Wendlandii*, Robins., a genus closely allied to *Ageratum*; this *Alomia*, from southern Mexico, is a perennial, 1 foot or more high, with ovate, strongly toothed opposite leaves. Flowers of the plant cultivated under this name are blue or white).
AGLAONEMA. *A. costatum*.
AGONIS. *A. flexuosa*: **Leptospermum flexuosum*.
AGROSTEMMA. *A. Cæli*: *Lychnis Cæli-rosa*.
 — *Cæli-rosa*: *Lychnis Cæli-rosa*.
 — *Flos-Jovis*: *Lychnis Flos-Jovis*.
AGROSTIS. *A. nebulosa*.
AILANTHUS. **A. glandulosa*: *A. altissima*, Swingle (*A. glandulosa* not tenable, as it is the more recent name).
AIRA. *A. cærulea*: *Molinia cærulea*.
 — *foliis variegatis*: *Molinia cærulea variegata*.
AJUGA. *A. genevensis*.
 — *reptans*.
AKEBIA. **A. lobata*.
 — **quinata*.
ALBIZZIA. **A. Julibrissin*.
 — **lophantha*.
ALECTRYON. **A. excelsum*.
ALEURITES. **A. Fordii*.
ALLAMANDA. **A. cathartica*.
 — *Hendersonii*: **A. cathartica* *Hendersonii*.
 — *Williamsii*: **A. cathartica* *Williamsii*.
ALLIUM. *A. ascalonicum* (Shallot).
 — *Cepa* (Onion).
 — *fistulosum* (Welsh Onion).
 — *Moly*.
 — *Porum* (Leek).
 — *sativum* (Garlic).
 — *Schenoprasum* (Chives).
ALNUS. **A. cordata*.
 — **glutinosa*.
 — **incana*.
 — *laciniata*: name probably applied to either **A. incana pinnatifida* or **A. glutinosa laciniata*.
 — **Mitchelliana* (American Green Alder); either or both *A. viridis* or *A. alnobetula* of American catalogues.
 — **rugosa*.
 — **tenuifolia*.
 — **viridis* (European Green Alder). Often confused with American Green Alder.
ALONSOA. *A. acutifolia*.
 — *albiflora*: *A. acutiflora candida*.
 — *grandiflora*: *A. Warscewiczii*.
 — *linifolia*.
 — *Warscewiczii*.
ALOYSIA. *A. citriodora*: *Lippia citriodora*.
ALPINIA. *A. Sanderæ*.
ALSINE. *A. pinifolia*.
ALSOPHILA. *A. australis*.

ALSTROEMERIA. *A. aurantiaca*.

— *aurca*: *A. aurantiaca*.
 — *brasilensis*.
 — *chilensis*.
 — *pulchella*.
ALTERNANTHERA. **A. aurea*: *Telanthera Bettzickiana aurea*.
 — *rosea*: *T. amœna rosea*.
 — *versicolor*: *T. versicolor*.
ALTHÆA. *A. frutex*: **Hibiscus syriacus*.
 — **rosea* (Hollyhock).
 Many names listed under this genus are probably forms of *Hibiscus syriacus*, as *A. alba*, *amplissima*, *argentea*, *cærulea*, *carnea*, *coelestis*, *elegantissima*, *grandiflora*, *Leopoldii*, *Meehanii*, *pæoniiflora*, *punica*, *rubra*, *Van Houttei*, and others.
ALYSSUM. *A. argenteum*.
 — *Bentharii*: *A. maritimum* *Bentharii*.
 — *maritimum*.
 — *procumbens*: *A. maritimum* *procumbens*.
 — *rostratum*.
 — *saxatile*.
AMARANTHUS (the spelling *Amarantus*, while etymologically correct, is not now much used in this country, the form *Amaranthus* having been employed by Linnæus). *A. atropurpureus*: probably *A. caudatus atropurpureus*, not *A. atropurpureus* of botanists.
 — *bicolor*: *A. gangeticus melancholicus*.
 — *caudatus*.
 — *cruentus*: signifies either *A. hypochondriacus sanguineus* or *A. paniculatus cruentus*.
 — *gangeticus*.
 — *Henderi*.
 — *melancholicus*: *A. gangeticus melancholicus*.
 — *salicifolius*.
 — *tricolor*: *A. gangeticus melancholicus*.
AMARYLLIS. *A. Atamasco*: *Zephyranthes Atamasco*.
 — *Belladonna*.
 — *equestris*: *Hippeastrum equestre*.
 — *formosissima*: *Sprekelia formosissima*.
 — *Hallii*: *Lycoris squamigera*.
 — *Johnsonii*: *Hippeastrum Johnsonii*.
 — *lutea*: *Sternbergia lutea*.
 — *solandri*: probably *Hippeastrum solandriflorum*.
 — *vittata*: *Hippeastrum vittatum*.
AMBERBOA. *A. muricata*: *Volu-tarella muricata*.
AMBROSIA. *A. mexicana*: probably an *Artemesia*.
AMELANCHIER. **A. alnifolia*.
 — *Botryapium*: **A. canadensis*; sometimes applied to *A. oblongifolia*.
 — **canadensis*, but the stock is probably *A. lævis*.
 — **oblongifolia*.
 — *vulgaris*: **A. rotundifolia*.

- AMMOBIUM.** *A. alatum.*
— *grandiflorum:* *A. alatum grandiflorum.*
- AMOMUM.** *A. Cardamon.*
- AMORPHA.** **A. canescens.*
— *fragrans:* **A. fruticosa*, or an unimportant form of it.
— **fruticosa.*
— *montana:* **A. glabra.*
— *nana:* **A. microphylla.*
- AMORPHOPHALLUS.** *A. Rivieri.*
- AMPELOPSIS.** **A. aconitifolia*, but often is *A. aconitifolia palmiloba.*
— **cordata.*
— *dumetorum:* *Parthenocissus vitacea.* **A. vitacea.*
— *Engelmannii:* *P. quinquefolia Engelmannii:* **A. quinquefolia Engelmannii.*
— **Henryana:* *P. Henryana.*
— **heterophylla.*
— **humulifolia.*
— **hypoglauc.*
— *leoides*, but the plant in cultivation is **A. Watsoniana* (page 3565); the true *A. leoides* is not in cultivation.
— *Lowii:* *P. tricuspidata Lowii:* **A. tricuspidata Lowii.*
— **megalophylla.*
— *muralis:* *P. quinquefolia murorum:* **A. quinquefolia murorum.*
— **quinquefolia:* *P. quinquefolia.*
— *stricta:* probably an error for *Cissus striata.*
— **Thomsonii:* *P. Thomsonii.*
— *tricolor:* **A. heterophylla elegans.*
— **tricuspidata:* *P. tricuspidata.*
— *Veitchii:* *P. tricuspidata Veitchii:* **A. tricuspidata Veitchii.*
— **vitacea:* *P. vitacea.*
- AMSONIA.** *A. Amsonia:* *A. Tabernæmontana.*
— *angustifolia.*
— *salicifolia:* *A. Tabernæmontana.*
— *Tabernæmontana.*
- AMYGDALUS.** *A. chinensis:* **Prunus japonica* and **P. glandulosa* (Cherry - Almonds; sometimes known as "flowering almonds").
— **communis:* *P. communis* (Almond).
— **Davidiana:* *P. Davidiana.*
— **nana:* *P. nana* (Russian Dwarf Almond).
— **Persica:* *P. Persica* (Peach).
— *sibirica:* perhaps **P. Armeniaca sibirica* (Siberian Apricot) or *P. nana* (**A. nana*).
— **triloba* (Flowering Almond): *P. triloba.*
- ANACARDIUM.** *A. occidentale.*
- ANACHARIS.** *A. canadensis:* *Elodea canadensis.*
- ANAGALLIS.** *A. grandiflora:* *A. linifolia.*
- ANANAS.** *A. sativus.*
- ANAPHALIS.** *A. margaritacea* (*Antennaria*).
- ANCHUSA.** *A. Barrelieri.*
— *capensis.*
— *italica.*
— *mysotidiflora.*
— *officinalis.*
- ANDROMEDA.** *A. arborea:* **Oxydendrum arboreum.*
— *calyculata:* **Chamædaphne calyculata.*
— *Catesbæi:* **Leucothoe Catesbæi.*
— *floribunda:* **Pieris floribunda.*
— *japonica:* **P. japonica.*
— *mariana:* **P. mariana.*
— **polifolia.*
— *speciosa:* **Zenobia pulverulenta.*
- ANDROPOGON.** *A. argenteus.*
- ANEMONE.** *A. acutiloba:* *Hepatica acutiloba.*
— *apennina.*
— *canadensis.*
— *coronaria.*
— *fulgens.*
— *Hepatica:* *Hepatica triloba.*
— *hortensis.*
— *hupehensis.*
— *japonica.*
— *nemorosa.*
— *Nuttalliana:* *A. patens Nuttalliana.*
— *patens.*
— *pennsylvanica:* *A. canadensis.*
— *Pulsatilla.*
— *sylvestris.*
— *vitifolia.*
- ANEMONELLA** (*Syndesmon* is the name under the American Code).
A. thalictroides.
- ANEMONOPSIS.** *A. macrophylla.*
- ANGELONIA.** *A. grandiflora.*
- ANGOPHORA.** **A. intermedia* (page 3565).
— **lanceolata.*
- ANNONA.** *A. Cherimola.*
— *glabra.*
— *muricata.*
— *reticulata.*
— *squamosa.*
- ANOMATHECA.** *A. cruenta:* *Lapeyrousia cruenta.*
- ANTENNARIA.** *A. dioica.*
— *margaritacea:* *Anaphalis margaritacea.*
- ANTHEMIS.** *A. arabicus:* *Cladranthus arabicus.*
— *Kelwayi.*
— *nobilis.*
— *tinctoria.*
- ANTHERICUM.** *A. comosum:* *Chlorophytum comosum.*
— *Liliago.*
— *Liliastrum:* *Paradisea Liliastrum.*
— *vittatum:* *Chlorophytum elatum.*
- ANTHURIUM.** *A. Andræanum.*
— *crystallinum.*
— *regale.*
— *Scherzerianum.*
- ANTIGONON.** **A. leptopus.*
- ANTIRRHINUM.** *A. album:* *A. majus.*
— *atrococcineum*, delicate, grandiflorum, luteum, maximum, picturatum, striatum. Apparently all forms of *A. majus.*
- APIOS.** **A. tuberosa* (*Glycine Apios* in American Code, but not adopted under International Rules).
- APIUM.** *A. graveolens* (Celery).
- APLECTRUM.** *A. hyemale.*
- APONOGETON.** *A. distachyon:* *A. distachyus.*
— *fenestralis* (*Ouvirandra*).
- AQUILEGIA.** *A. akitensis* (page 3565).
— *alpina.*
— *cærulea.*
— *californica:* *A. formosa truncata.*
— *canadensis.*
— *chrysantha.*
— *flabellata.*
— *formosa.*
— *glandulosa.*
— *haylodgensis.*
— *Helenæ:* *A. cærulea Helenæ.*
— *Jæschkianii:* *A. chrysantha Jæschkianii.*
— *nivea:* *A. vulgaris nivea.*
— *olympica:* *A. vulgaris olympica.*
— *oxysepala.*
— *sibirica.*
— *Skinneri.*
— *truncata:* *A. formosa truncata.*
— *Vervæneana:* *A. vulgaris Vervæneana.*
— *vulgaris.*
- ARABIS.** *A. albida.*
— *alpina.*
— *mollis.*
— *rosea:* *A. muralis.*
- ARACHIS.** *A. hypogæa.*
- ARALIA.** *A. Balfouriana:* *Polyscias Balfouriana.*
— *cashmeriana:* *A. cachemirica.*
— *Chabrieri:* *Elæodendron orientale.*
— **chinensis.*
— **cordata.*
— *elegantissima:* *Dizygotheca elegantissima.*
— *filicifolia:* *Polyscias filicifolia.*
— *Guilfoylei:* *Polyscias Guilfoylei.*
— *japonica:* **Fatsia japonica;* stock probably sometimes **A. chinensis.*
— *Kerchoveana:* *Dizygotheca Kerchoveana.*
— *mandshurica:* **A. chinensis mandshurica.*
— *Maximowiczii:* **Acanthopanax ricinifolium Maximowiczii.*
— *papyrifera:* **Tetrapanax papyriferum.*
— *pentaphylla:* **Acanthopanax pentaphyllum.*
— **racemosa.*
— *Sieboldii:* **Fatsia japonica.*
— **spinosa.*
— *Veitchii:* *Dizygotheca Veitchii.*
- ARAUCARIA.** **A. Bidwillii.*
— *brasiliensis:* **A. brasiliensis.*
— **excelsa.*
— **imbricata.*
— *robusta:* **A. excelsa robusta.*
- ARBUTUS.** **A. Menziesii.*
— **Unedo.*
- ARCHONTOPHÆNIX.** *A. Alexandræ* (*Ptychosperma*).
— *Cunninghamii* (*Ptychosperma*).
- ARCTOSTAPHYLOS.** **A. glauca.*
— **tomentosa.*
— **Uva-ursi.*
- ARCTOTIS.** *A. breviscapa.*
— *grandis.*
- ARDISIA.** **A. crenulata.*

- ARECA.** *A. Baueri*: *Rhopalostylis Baueri*.
 — *Catechu*.
 — *lutescens*: *Chrysalidocarpus lutescens*.
 — *rubra*: *Acanthophoenix rubra*.
 — *sapida*: *Rhopalostylis sapida*.
 — *Verschaffeltii*: *Hyophorbe Verschaffeltii*.
- ARENARIA.** *A. caespitosa*: *A. verna caespitosa*.
 — *grœnlandica*.
 — *montana*.
- ARENGA.** *A. saccharifera*.
- ARETHUSA.** *A. bulbosa*.
- ARGEMONE.** *A. grandiflora*.
- ARGYREIA.** *A. splendens* (page 3566).
- ARISEMA.** *A. Dracontium*.
 — *triphylum*.
- ARISTOLOCHIA.** **A. elegans*.
 — *grandiflora*.
 — *macrophylla*; in some cases probably designates *A. brasiliensis macrophylla*.
 — **Sipho*: *A. macrophylla*.
 — *Sturtevantii*: **A. grandiflora Sturtevantii*.
- ARMERIA.** *A. alba*: probably *Statice Armeria alba*.
 — *alpina*: *S. alpina*.
 — *cephalotes*: probably *S. pseudoarmeria*, but possibly *S. mauritanica* is meant in the trade.
 — *dianthoides*: *S. plantaginea leucantha*.
 — *formosa*: *S. pseudoarmeria*.
 — *Lauchœana*: *S. Armeria Lauchœana*.
 — *maritima*: *S. Armeria*.
- ARNEBIA.** *A. cornuta*.
- ARONIA** (*Malus. Pyrus*). **A. arbutifolia*.
 — **atropurpurea*.
 — *erythrocarpa*: **A. arbutifolia*.
 — **melanocarpa*.
 — *nigra*: **A. melanocarpa*.
- ARRHENATHERUM.** *A. bulbosum*:
A. elatius tuberosum.
- ARTEMISIA.** *A. Abrotanum*.
 — *Absinthium*.
 — *Dracunculus*.
 — *frigida*.
 — *lactiflora*: a white-flowered form of *A. vulgaris*.
 — *pedemontana*: *A. lanata*.
 — *pontica*.
 — *Purshiana*.
 — *sacrorum*.
 — *Stelleriana*.
 — *vulgaris*.
- ARTOCARPUS.** *A. incisa* (Bread-Fruit).
- ARUM.** *A. crinitum*: *Helicodiceros muscivorus*.
 — *Dracunculus*: *Dracunculus vulgaris*.
 — *italicum*.
 — *maculatum*.
 — *palæstinum*.
- ARUNCUS.** *A. Aruncus*: *A. sylvester* (*Spiræa*).
 — *astilboides*, but the plant in cultivation is *Astilbe astilboides*.
 — *sylvester* (*Spiræa*).
- ARUNDINARIA** (*Bambusa*). **A. auricoma*.
 — **falcata*.
 — **Falconeri*.
 — *foliis variegatis*: probably **A. Fortunei*.
 — **Hindsii*.
 — **japonica*.
 — **Simonii*.
 — **Veitchii*.
- ARUNDO.** **A. Donax*.
- ASARUM.** *A. arifolium*.
 — *canadense*.
 — *virginicum*.
- ASCLEPIAS.** *A. Curassavica*.
 — *Hallii*.
 — *incarnata*.
 — *tuberosa*.
- ASIMINA.** **A. triloba*.
- ASPARAGUS.** *A. asparagoides* (*Myrsiphyllum. Florists' Smilax*).
 — *Cooperi*.
 — *Hatcheri*: probably *A. plumosus robustus*.
 — *madagascariensis*.
 — *medeoloides*: *A. asparagoides*.
 — *nanus*: *A. plumosus nanus*.
 — *officinalis* (*Edible Asparagus*).
 — *plumosus*.
 — *scandens*.
 — *Sprengeri*.
 — *tenuissimus*: *A. plumosus tenuissimus*.
- ASPERULA.** *A. azurea*: *A. orientalis*.
 — *hexaphylla*.
 — *odorata*.
- ASPHODELINE.** *A. lutea* (*Asphodelus*).
Asphodelus. *A. albus*.
 — *luteus*: *Asphodeline lutea*.
- ASPIDISTRA.** *A. lurida*.
- ASPIDIUM.** *A. achrostichoides*: *Polystichum acrostichoides*.
 — *aculeatum*: *P. aculeatum*.
 — *Braunii*: *P. Braunii*.
 — *cristatum*: *Dryopteris cristata*.
 — *Filix-mas*: *D. Filix-mas*.
 — *Goldieanum*: *D. Goldieana*.
 — *marginale*: *D. marginalis*.
 — *munitum*: *P. munitum*.
 — *noveboracense*: *D. noveboracensis*.
 — *spinulosum*: *D. spinulosa*.
 — *Thelypteris*: *D. Thelypteris*.
 — *Tsus-sinense*: *P. Tsus-sinense*.
- ASPLENIUM.** *A. acrostichoides*.
 — *angustifolium*.
 — *bulbiferum*.
 — *ebeneum*: *A. platyneuron*.
 — *Filix-fœmina*.
 — *Goringianum*.
 — *Nidus-avis*: *A. Nidus* (*Neotopteris*).
 — *platyneuron*.
 — *Thelypteris*: *Dryopteris Thelypteris*.
 — *thelypteroides*: *A. acrostichoides*.
 — *Trichomanes*.
- ASTER.** *A. acris*.
 — *alpinus*.
 — *Amellus*.
 — *amethystinus*.
 — *azureus*.
- ASTER.** continued.
 — *bessarabicus*: *A. Amellus bessarabicus*.
 — *Chapmanii*.
 — *cordifolius*.
 — *corymbosus*.
 — *Curtisii*.
 — *decorus*: *A. lævis*.
 — *ericoides*.
 — *formosissimus*.
 — *grandiflorus*.
 — *himalayensis*: *A. himalaica*.
 — *lævis*.
 — *lilacinus*.
 — *longifolius*.
 — *Maackii*.
 — *macrophyllus*.
 — *Mesa grande*: possibly is *Erigeron macranthus*.
 — *multiflorus*.
 — *novæ-angliæ*.
 — *novi-belgii*.
 — *patens*.

- **sinensis*: *R. sinense*: **A. mollis*.
- **Vaseyi*: *R. Vaseyi*.
- **viscosa*: *R. viscosum*.
- **yodogawa*: *R. poukhanense yodogawa*.

AZARA. **A. microphylla*.

- BACCHARIS**. **B. halimifolia*.
- BACTRIS**. *B. major*.
- BAMBUSA**. *B. Alphonsei*: probably *B. Alphonse Kurri*.
- **argentea*.
- *aurea*: **Phyllostachys aurea*.
- **aureo-striata*.
- *auricoma*: **Arundinaria auricoma*.
- **fastuosa*.
- *Fortunei*: **Arundinaria Fortunei*.
- *Henonis*: **Phyllostachys Henonis*.
- *nigra*: **Phyllostachys nigra*.
- **palmata*.
- *Simonii*: **Arundinaria Simonii*.
- *Veitchii*: **Arundinaria Veitchii*.
- *viminalis*: **Phyllostachys ruscifolia*.
- *violescens*: **Phyllostachys violescens*.
- **vulgaris*.
- BAPTISIA**. **B. australis*.
- *tinctoria*.
- BARBAREA**. *B. præcox*.
- *vulgaris*.
- BARTONIA**. *B. aurea*: *Mentzelia aurea*, Baill. (*M. Lindleyi* is untenable under the rules).

- BEGONIA**. *B. albo-picta*.
- *argentea*: *B. maculata*.
- *corallina*.
- *Credneri*.
- *crispa*: *B. manicata crispa*.
- *Erfordii*.
- *gracilis*.
- *Haageana*.
- *metallica*.
- *Rex*.
- *rubra*: *B. coccinea*.
- *Sandersonii*: *B. Digswelliana*.
- *semperflorens*.
- *Thurstonii*.
- *Warszewiczii*: *B. conchæfolia*.
- Trade names of horticultural begonias often appear in Latin form.

BELAMCANDA. *B. chinensis*.**BELLIS**. *B. perennis*.**BENINCASA**. *B. cerifera*: *B. hispida*.**BENZOIN**. *B. odoriferum*: **B. æstivale* (*Laurus. Lindera*).**BERBERIS** (see page 3566). **B. aggregata*.

- *Aquifolium*: **Mahonia Aquifolium*.
- *brevipaniculata*: perhaps sometimes applied to *B. aggregata*.
- **buxifolia*.
- **canadensis*.
- **Darwinii*.
- **dictyophylla*.
- *dulcis*: **B. buxifolia*; sometimes the name for *B. vulgaris dulcis*.
- *fascicularis*: **Mahonia pinnata*.
- **Fendleri*.
- **ilicifolia*, but often misapplied to *B. Neubertii latifolia*.
- *japonica*: **Mahonia japonica*.
- *nervosa*: **Mahonia nervosa*.
- *purpurea*: **B. vulgaris atropurpurea*.
- *Regeliana*: **B. amurensis japonica* (page 3566).
- *repens*: **Mahonia repens*.
- *sanguinolenta*: **B. sinensis*.
- **Sargentiana*; but the plant in cultivation under this name is often *B. Julianæ* (page 3566).
- **Sieboldii*.
- **stenophylla*.
- **Thunbergii*.
- **verruculosa*.
- **vulgaris*.
- *Wallichiana* (the plant erroneously in cultivation under this name may be *B. Sargentiana*, *B. Julianæ*, *B. Hookeri*, or *B. xanthoxylon* (page 3566)).
- **Wilsonæ*.

BERCHEMIA. **B. racemosa*.**BESSERA**. *B. elegans*.**BETA**. *B. vulgaris* (Beet).**BETONICA**. *B. grandiflora*: *Stachys grandiflora*.— *officinalis*: *Stachys officinalis*.**BETULA**. **B. alba*: *B. pubescens*; also includes *B. pendula*, under the trade name **B. alba pendula*.

- **fontinalis*.
- **lenta*.
- **lutea*.
- **nigra*.
- *papyracea*: **B. papyrifera*.
- **papyrifera*.
- *pendula*: **B. alba pendula*.
- **populifolia*.
- *purpurea*: the purple-leaved form of either *B. populifolia* or *B. pendula*.
- *rubra*: **B. nigra*.
- *Youngii*: **B. alba pendula Youngii*.

BICUCULLA (name not allowed under International Rules). *B. eximia*: *Dicentra eximia*.— *spectabilis*: *Dicentra spectabilis*.**BIDENS**. *B. atrosanguinea*: *Cosmos diversifolius*.— *dahlioides*.**BIGNONIA**. **B. buccinatoria*: *Phædranthus buccinatorius*.

- **capreolata*.
- **grandiflora*: *Campsis chinensis*.
- **hybrida*: *Campsis hybrida*.
- **radicans*: *Campsis radicans*.
- **speciosa*: *Clytostoma callistegoides*.

BIGNONIA, continued.

- *Tweedianæ*: **B. Unguis-cati*.
- **venusta*: *Pyrostegia venusta*.
- BIOTA**. *B. aurea*: **Thuja orientalis aurea*.
- *japonica*: **T. orientalis Sieboldii*; some of the stock in trade is perhaps *T. orientalis gracilis*.
- *orientalis*: **T. orientalis*.
- *pyramidalis*: **T. orientalis pyramidalis*.

BLECHNUM. *B. brasiliense*.— *occidentale*.**BLETIA**. *B. hyacinthina*: *Bletilla hyacinthina*.**BLETILLA**. *B. hyacinthina* (*Bletia*).**BLUMENBACHIA**. *B. lateritia* (*Loasa*).**BOCCONIA**. *B. cordata*.— *japonica*: *B. cordata*.— *microcarpa*.**BOLTONIA**. *B. asteroides*.— *latisquama*.**BORAGO**. *B. officinalis*.**BOTRYCHIUM**. *B. obliquum*.— *ternatum*: *B. obliquum*.— *virginicum*: *B. virginianum*.**BOUGAINVILLEA**. **B. glabra*.— *lateritia*: **B. spectabilis lateritia*.— **refulgens*.— *Sanderiana*: **B. glabra Sanderiana*.— **spectabilis*.**BOUSSINGAULTIA**. *B. baselloides*.**BOUVARDIA**. *B. Humboldtii*.— *Jacquinii*: *B. triphylla*.— *triphylla*.**BRACHYCHITON**. *B. diversifolium*; also perhaps refers to *B. populneum*.**BRACHYCOME**. *B. iberidifolia*.**BRAHEA**. *B. filifera*: *Washingtonia filifera*.— *robusta*: *W. filifera robusta*.**BRASENIA**. *B. peltata*: *B. Schreberi*.**BRASSICA**. *B. acephala*: *B. oleracea acephala* (*Kale*).— *alba* (*Sinapis*).— *arvensis* (*Sinapis*).— *botrytis*: *B. oleracea botrytis* (*Cauliflower*).— *campestris* (*Rutabaga*).— *capitata*: *B. oleracea capitata* (*Cabbage*).— *chinensis*.— *japonica* (*Sinapis*).— *Napus* (*Rape*).— *oleracea*.

— *Pe-tsai* (*Brassica Pe-tsai*, Bailey, was founded in 1894 on cultivated material. *Sinapis pekinensis*, Loureiro, 1790, one of the vernacular names of which is *Pe-tsai*, has been brought over into *Brassica* as *B. pekinensis*, Skeels. If *B. Pe-tsai*, Bailey, and *B. pekinensis*, Skeels, prove to be identical, the latter name must hold. More than one species may be involved.)

— *Rapa* (*Turnip*).

- BRAUNERIA** (the name under the American Code). *B. angustifolia*: *Echinacea angustifolia*.
 — *purpurea*: *E. purpurea*.
- BRAVOA**. *B. geminiflora*.
- BRIZA**. *B. geniculata*: *Eragrostis obtusa*.
 — *gracilis*: *B. minor*.
 — *maxima*.
- BRIZOPYRUM**. *B. siculum*: *Desmazeria sicola*.
- BROMUS**. *B. brizæformis*.
 — *macrostachys*.
 — *madritensis*.
- BROUSSONETIA**. **B. papyrifera*.
- BROWALLIA**. *B. elata*: *B. demissa*.
 — *Jamesonii*: *Streptosolen Jamesonii*.
 — *Roezii*: *B. grandiflora*.
 — *speciosa*.
 — *viscosa*.
- BRUCKENTHALIA**. **B. spiculifolia*.
- BRUNELLA**. A pre-Linnæan spelling of *Prunella* (which see), and still widely used.
- BRYONIA**. *B. laciniosa*: *Bryonopsis laciniosa*.
- BRYONOPSIS**. *B. laciniosa* (*Bryonia*).
- BUDDLEIA**. **B. asiatica*.
 — **globosa*.
 — **intermedia*.
 — **japonica*.
 — **Lindleyana*.
 — **magnifica*: **B. Davidii magnifica*.
 — **officinalis*.
 — *variabilis*: **B. Davidii*.
 — *Veitchii*: **B. Davidii Veitchiana*.
- BUPHTHALMUM**. *B. cordifolium*: *B. speciosum* (*Telekia*).
 — *salicifolium*.
- BUXUS**. *B. arborescens*: **B. sempervirens arborescens*.
 — **balearica*.
 — *Fortunei*: **B. japonica*.
 — *Handsworthii*: **B. sempervirens Handsworthii*.
 — **japonica*.
 — *rotundifolia*: **B. sempervirens rotundifolia*.
 — **sempervirens*.
 — *suffruticosa*: **B. sempervirens suffruticosa*.
- CABOMBA**. *C. viridifolia*: *C. caroliniana*.
- CACALIA**. *C. aurea*: probably an *Emilia*.
 — *coccinea*: *Emilia flammea*.
- CÆSALPINIA**. **C. Gilliesii* (*Poinciana*).
 — **C. pulcherrima*.
- CALADIUM**. *C. esculentum*: *Colocasia antiquorum esculenta*. There are many Latin-named varieties.
- CALAMINTHA**. *C. alpina*: *Satureia alpina*.
- CALAMPELIS**. *C. scaber*: *Ecce-mocarpus scaber*.
- CALANDRINIA**. *C. grandiflora*.
 — *speciosa*: *C. Menziesii*.
 — *umbellata*.
- CALATHEA**. Usually listed under *Maranta*, which see.
- CALCEOLARIA** (the application of the American Code transfers *Calceolaria* to *Ionidium*, one of the Violet family; the *calceolaria* of florists then becomes *Fagelia*, and the leguminous *Fagelia* [Vol. III, page 1201] becomes *Bolusafræ*). *C. hybrida*: *C. herbeohybrida*.
 — *pinnata*: some of the stock is probably *C. scabiosæfolia*.
 — *profusa*.
 — *rugosa*: *C. integrifolia*.
 — *scabiosæfolia*.
 — *Veitchii*.
- CALENDULA**. *C. officinalis*.
 — *pluvialis*: *Dimorphotheca annua*.
 — *Pongei*: *D. annua ligulosa*.
- CALIMERIS**. *C. incisa*.
- CALLA**. *C. æthiopica*: *Zantedeschia æthiopica*.
 — *Elliottiana*: *Z. Elliottiana*.
 — *palustris*.
- CALLICARPA**. **C. americana*.
 — **japonica*.
 — **purpurea*: *C. dichotoma* (the tenable name, under the rules, rather than *C. purpurea*).
- CALLIOPSIS**. *C. bicolor*: *Coreopsis tinctoria*.
 — *cardaminefolia*: *Coreopsis cardaminefolia*.
 — *Drummondii*: *Coreopsis Drummondii*.
 — *lanceolata*: *Coreopsis lanceolata*.
 — *marmorata*: *Coreopsis tinctoria*.
 — *nigra*: *Coreopsis tinctoria atropurpurea*.
 — *radiata*: *Coreopsis radiata*.
 — *tinctoria*: *Coreopsis tinctoria*.
- CALLIRHOË**. *C. involucrata*.
 — *pedata*.
 — *verticillata*: *C. involucrata*.
- CALLISTEMON**. **C. coccineus* (page 3566).
 — **Cunninghamii* (page 3566).
 — *floribundus*: **C. lanceolatus*.
 — *hybridus* (page 3566).
 — **lanceolatus* (*Metrosideros*).
 — *robustus* (page 3566).
 — *splendens* (page 3566).
 — *viridifolius*: probably *C. salignus viridiflorus*.
- CALLISTEPHUS**. *C. chinensis* (*China Aster*).
- CALLITRIS**. *C. australis*: *C. rhomboidea*.
- CALLUNA**. **C. vulgaris* (*Erica*).
- CALOCHORTUS**. *C. flavus* (*Cyclobothrus*).
- CALONYCTION**. *C. aculeatum* (*Ipomœa Bona-Nox*).
- CALOPOGON**. *C. pulchellus* (*Limodorum*).
- CALTHA**. *C. palustris*.
- CALYCANTHUS**. **C. floridus*.
 — *glaucus*: **C. fertilis glaucus*.
- CALYCANTHUS**, continued.
 — *macrophyllus*: **C. occidentalis*.
 — *præcox*: **Meratia præcox*.
- CALYPSO** (under the American Code, *Cyathæa* replaces this name).
C. borealis: *C. bulbosa*, *Oakes* (*C. borealis* erroneously).
- CALYSTEGIA**. *C. pubescens*: *Convolvulus japonicus*.
- CAMASSIA** (*Quamasia* under American Code). *C. Cusickii*.
 — *esculenta*: *C. Quamash*.
 — *Leichtlinii*.
- CAMELLIA**. **C. japonica*.
 — **Sasanqua*.
 — *Thea*: **Thea sinensis*.
- CAMPANULA**. *C. alliariæfolia*.
 — *amabilis*: *C. phytidocalyx*.
 — *attica*: *C. drabifolia*.
 — *barbata*.
 — *calycanthema*: *C. Medium calycanthema*.
 — *carpatia*.
 — *dahurica*: *C. glomerata dahurica*.
 — *glomerata*.
 — *grandiflora*: *Platycodon grandiflorum*.
 — *grandis*: *C. latiloba*.
 — *Grossekii*.
 — *lactiflora*.
 — *latifolia*.
 — *longestyla*.
 — *Lorei* (*Loreyi*): *C. ramosissima*.
 — *macrantha*: probably *C. latifolia macrantha*, but perhaps also *C. persicifolia macrantha*.
 — *macrostyla*.
 — *Medium*.
 — *mirabilis*.
 — *nobilis*. *C. punctata*.
 — *persicifolia*.
 — *punctata*.
 — *pyramidalis*.
 — *rapunculoides*.
 — *rhomboidalis*.
 — *rotundifolia*.
 — *Speculum*: *Specularia Speculum*.
 — *Trachelium*.
 — *turbinata*: *C. carpatia turbinata*.
 — *Van Houttei*.
 — *Vidalii*.
- CAMPHORA**. *C. officinalis*: **Cinnamomum Camphora*.
- CAMPSIS** (*Bignonia*, *Tecoma*). *C. chinensis*: **Bignonia grandiflora*.
 — *hybrida*: **B. hybrida*.
 — *radicans*: **B. radicans*.
- CAMPTOSORUS**. *C. rhizophyllus*.
- CANNA**. *C. indica*.
 In garden *Cannas* the original species are scarcely distinguishable.
- CANNABIS**. *C. gigantea*: a form of *C. sativa*.
- CAPSICUM**. *C. annuum*.
 — *frutescens*.
- CARAGANA**. **C. arborescens*.
 — **Chamlagu*.
 — *frutescens*: **C. frutex*.
 — **microphylla*.
- CARDAMINE**. *C. pratensis*.
- CARDIOSPERMUM**. *C. Halicacabum*.

- CARDUUS.** *C. benedictus*: *Cnicus benedictus*.
- CAREX.** *C. Fraseri*.
— *Morrowii*.
- CARICA.** **C. Papaya*.
- CARISSA.** **C. grandiflora*.
- CARPENTERIA.** **C. californica*.
- CARPINUS.** *C. americana*: **C. caroliniana*.
— **Betulus*.
— **caroliniana*.
- CARUM.** *C. Carvi* (Caraway).
- CARYA** (*Carya*, of Nuttall, 1818. *Scoria*, Rafinesque, 1808, but there is evidence that *Hicoria* was meant. *Hicorius*, Raf., 1817. *Hicoria*, Raf., 1838). *C. alba*: **Hicoria alba* (Mockernut).
— *amara*: *C. cordiformis*: **H. cordiformis*.
— *cordiformis*: **H. cordiformis*.
— *glabra* (Pignut): **H. glabra*.
— *laciniosa* (Shellbark Hickory): **H. laciniosa*.
— *ovata*: **H. ovata* (Shagbark Hickory).
— *Pecan*: **H. Pecan*.
— *porcina*: *C. glabra*: **H. glabra* (Pignut).
— *sulcata*: *C. laciniosa*: **H. laciniosa* (Shellbark Hickory).
— *tomentosa*: *C. alba*: **H. alba*.
- CARYOPHYLLUS.** See *Eugenia*.
- CARYOPTERIS.** *C. Mastacanthus*: **C. incana*.
- CARYOTA.** **C. mitis*.
— *sobolifera*: *C. mitis*.
— *urens*.
- CASIMIROA.** *C. edulis*.
- CASSANDRA.** *C. calyculata*: **Chamaedaphne calyculata*.
- CASSIA.** *C. artemisioides*.
— **corymbosa*.
— *floribunda*: **C. corymbosa*.
— *laevigata*.
— *marilandica*.
— *polyantha* (page 3566).
— *tomentosa*.
- CASTALIA.** See *Nymphæa*.
- CASTANEA.** *C. americana*: **C. dentata*.
— **japonica*: *C. crenata*.
— **pumila*.
— **sativa*.
— *vesca*: **C. sativa*.
- CASTANOPSIS.** **C. chrysophylla* (see also page 2891 for other species).
- CASTILLEJA.** *C. indivisa*.
- CASUARINA.** **C. Cunninghamiana*.
— **equisetifolia*.
— **stricta*.
- CATALPA.** **C. bignonioides*.
— **Bungei*: *C. bignonioides nana* (*C. Bungei* of botanists is a good species, apparently not in the trade although likely to appear).
— **hybrida*.
— **Kaempferi*: *C. ovata*.
- CATALPA**, continued.
— **ovata*.
— **speciosa*.
- CATANANCHE.** *C. bicolor*: *C. cærulea bicolor*.
— *cærulea*.
- CAULOPHYLLUM.** *C. thalictroides*.
- CEANOTHUS.** **C. americanus*.
— **azureus*.
— **hybridus*.
— **thyrsiflorus*.
- CEDRELA.** **C. sinensis*.
- CEDRONELLA.** *C. cana*.
- CEDRUS.** **C. atlantica*.
— **Deodara*.
— **Libani*.
- CELASTRUS.** *C. articulatus*: **C. orbiculatus*.
— **orbiculatus*.
— *punctatus*: **C. orbiculatus punctatus*.
— **scandens*.
- CELOSIA.** *C. coccinea*: *C. cristata*.
— *cristata*.
— *Huttonii*.
— *spicata*: perhaps a form of *C. cristata*, not *C. spicata* of botanists.
- CELSIA.** *C. Arcturus* (page 3566).
- CELTIS.** **C. australis*.
— *crassifolia*: **C. occidentalis crassifolia*.
— **mississippiensis*.
— **occidentalis*.
— **reticulata*.
- CENTAUREA.** *C. americana*.
— *babylonica*.
— *candidissima*: *C. Cineraria*.
— *Clementei*.
— *Cyanus*.
— *dealbata*.
— *gymnocarpa*.
— *imperialis*.
— *macrocephala*.
— *montana*.
— *moschata*.
— *nigra*.
— *odorata*: *C. moschata*.
— *orientalis* (page 3567).
— *pulcherrima* (*Ætheopappus*).
— *ruthenica*.
— *suaveolens*: *C. moschata*.
- CENTAURIDIUM.** *C. Drummondii*: *Xanthisma texanum*.
- CENTRANTHUS.** *C. albus*: name likely to apply to either *C. ruber albus* or *C. macrosiphon albus*.
— *macrosiphon*.
— *ruber*.
- CENTROSEMA.** *C. grandiflora*: *C. virginianum*.
- CEPHALANTHUS.** **C. occidentalis*.
- CEPHALARIA.** **C. alpina*.
— *tatarica*.
- CEPHALOTAXUS.** **C. drupacea*.
— **Fortunei*.
— **Harringtonia* (*Taxus*).
— *pedunculata*: **C. Harringtonia*.
- CERASTIUM.** *C. Biebersteinii*.
— *tomentosum*.
- CERASUS.** *C. avium*: **Prunus avium*.
— *caproniana*: **P. Cerasus*.
— *caroliniana*: *P. caroliniana*: **Laurocerasus caroliniana*.
— *chinensis*: **P. glandulosa* and **P. japonica* (Cherry-Almonds).
— *ilicifolia*: **P. ilicifolia*.
— *integrifolia*: **P. Lyonii*.
— *japonica*: **P. subhirtella pendula* (Flowering Cherry).
— *Mahaleb*: **P. Mahaleb*.
— *Padus*: **P. Padus*.
— *pennsylvanica*: **P. pennsylvanica*.
— *Rhexii*: **P. Cerasus Rhexii*.
— *serotina*: **P. serotina*.
— *Sieboldii*: **P. Sieboldii*.
- CERATONIA.** **C. Siliqua*.
- CERATOSTIGMA.** *C. plumbaginoides* (Plumbago).
- CERCIDIPHYLLUM.** **C. japonicum*.
- CERCIS.** **C. canadensis*.
— **chinensis*.
— *japonica*: **C. chinensis*.
— **Siliquastrum*.
- CERCOCARPUS.** **C. parvifolius*.
- CEREUS.** *C. nycticalus*: *Selenicereus pteranthus*.
- CERINTHE.** *C. retorta*.
- CEROPTERIS.** *C. sulphurea* (*Gymnogramma*).
- CESTRUM.** **C. aurantiacum*.
— **elegans* (*Habrothamnus*).
— **fasciculatum*.
— **nocturnum*.
— **Parqui*.
- CHÆNOMELES.** *C. japonica* (*Chæ. Maulei*): **Cydonia Maulei*.
— *lagenaria* (the tenable name for the plant generally known as *Chæ. japonica*; *Cy. Maulei* now becomes *Chæ. japonica*. See page 3567). **Cydonia japonica*.
- CHÆROPHYLLUM.** *C. bulbosum* (Turnip-rooted Chervil).
- CHAMÆCERASUS.** *C. Albertii*: **Lonicera spinosa Albertii*.
— *Maackii*: **Lonicera Maackii*.
- CHAMÆCYPARIS.** **C. Lawsoniana* (*Cupressus*).
— *nutkaensis*: **C. nootkatensis* (*Cupressus*).
— **obtusa*.
— **pisifera*.
— *sphaeroidea*: **C. thyoides*.
- CHAMÆDAPHNE.** **C. calyculata* (*Andromeda. Cassandra*).
- CHAMÆLIRIUM.** *C. luteum*.
- CHAMÆPEUCE.** *C. diacantha*: *Cirsium diacantha*.
- CHAMÆROPS.** **C. canariensis*: a form of *C. humilis*.
— **elegans*: a form of *C. humilis*.
— *excelsa*: **Trachycarpus excelsa*.
— *Fortunei*: **Trachycarpus Fortunei*.
— **humilis*.
— *nepalensis*: **Trachycarpus Martiana*.
- CHARIEIS.** *C. heterophylla* (*Kaulfussia*).

CHAYOTA. See *Sechium*.

CHEILANTHES. *C. Fendleri*.

CHEIRANTHUS. *C. Allionii*

— *Cheiri*.

CHELONE. *C. barbata*: *Pentstemon barbatus*.

— *racemosa*.

— *simplex*: *C. racemosa simplex*.

CINERARIA. *C. grandiflora* and *C. hybrida*: forms or hybrids of *Senecio cruentus* (Florists' Cineraria).

CINERARIA, continued.

— *maritima*: *Senecio Cineraria*.

— *stellata*: a race of florists' cinerarias (offshoots of *Senecio cruentus*).

CINNAMOMUM. **C. Camphora* (*Camphora officinalis*).

— **Cassia*.

— **Loureirii*.

— **zeylanicum*.

CIRSIUM. *C. diacantha* (*Chamaepeuce*).

CISSUS (often listed as *Vitis*. Pages 3482, 3483). **C. capensis*.

— **discolor*.

— **oblonga*.

— **quadrangularis*.

— **rhombifolia*.

— **striata*.

CISTUS. **C. albidus*.

— **ladaniferus*.

— **laurifolius*.

— **monspeliensis*.

— **salvifolius*.

CITRULLUS. *C. Colocynthis* (*Colocynthis*).

— *vulgaris* (Watermelon).

CITRUS. *C. amara*: **C. Aurantium*.

— **aurantifolia* (Lime).

— **Aurantium* (Sour or Seville Orange).

— *Bigaradia*: **C. Aurantium*.

— *deliciosa*: **C. nobilis deliciosa* (Mandarin Orange).

— **grandis* (Grapefruit).

— **Limonia* (Lemon).

— **Medica* (Citron).

— **nobilis* (King Orange).

— **sinensis* (Common Orange).

— **trifoliata*: *Poncirus trifoliata*.

— *unshiu*: **C. nobilis unshiu* (Satsuma Orange).

CLADRANTHUS. *C. arabicus* (Anthemis).

CLADRASTIS. *C. amurensis*:
**Maackia amurensis*.

— **lutea*.

— *tinctoria*: **C. lutea* (Virgilia).

CLARKIA. *C. elegans*.

— *pulchella*.

CLAYTONIA. *C. caroliniana*.

— *virginica*.

CLEMATIS. **C. apiifolia*.

— **Armandii*.

— **coccinea*: *C. texensis*.

— **crispa*.

— *Davidiana*: **C. heracleæfolia Davidiana*.

— **Douglasii*.

— *erecta*: *C. recta*.

— **Flammula*.

— **florida*.

— **Fremontii*.

— **grata*.

— **Henryi*: *C. Lawsoniana Henryi*; a common horticultural variety, but not *C. Henryi* of botanists.

— **heracleæfolia*.

— **indivisa*.

— **integrifolia*.

— **Jackmanii*.

— **lanuginosa*.

CLEMATIS, continued.

— **ligusticifolia*.

— **montana*.

— **orientalis*.

— **paniculata*.

— **patens*.

— **recta*.

— **serratifolia*.

— **tangutica*.

— *tubulosa*: **C. heracleæfolia*.

— **Viorna*.

— **virginiana*.

— **Vitalba*.

— **Viticella*.

CLEOME. *C. gigantea*: *C. spinosa*, not *C. gigantea* of botanists.

CLERODENDRON. **C. trichotomum*.

CLETHRA. **C. acuminata*.

— **alnifolia*.

— **tomentosa*.

CLEYERA. **C. japonica*.

CLIVIA. *C. miniata*.

CLYTOSTOMA (Bignonia). *C. calistegioides*: **Bignonia speciosa*.

CNEORUM. **C. tricocon* (see Vol. V, page 2704).

COBÆA. *C. flore-alba*: probably refers to the white-flowered form of *C. scandens*; also known as *C. alba*.
— *macrostemma*: *C. macrostoma*.
— **scandens*.

COCCINIA. *C. indica*: *C. cordifolia*.

COCCOLOBA. *C. uvifera*.

COCOS. **C. australis*.

— **Bonnetii*, not known botanically.

— **campestris*.

— **Datil*.

— **eriospatha*.

— **flexuosa*.

— **nucifera*.

— **plumosa*.

— **schizophylla* (page 3567).

— **Weddelliana*.

CODIÆUM. The proper genus for the horticultural plants known as *Croton*.

COFFEA. **C. arabica*.

COIX. *C. Lacryma*: *C. Lacryma-Jobi*.

COLCHICUM. *C. autumnale*.

COLEUS. *C. thyrsoideus*.

— *Verschaffeltii*: *C. Blumei* *Verschaffeltii*.

COLLETIA. *C. cruciata*.

COLLIINSIA. *C. bartsia*: probably *C. bartsiaefolia*.

— *bicolor*.

— *grandiflora*.

— *multicolor*: *C. bicolor multicolor*.

— *verna*.

COLLOMIA. *C. coccinea*: *Gilia coccinea*.

— *grandiflora*: *Gilia grandiflora*.

COLOCASIA. *C. antiquorum* and var. *esculenta* (*Caladium*). See *Taro*, page 3311.

— *neo-guineensis*.

COLUTEA. **C. arborescens*.

COMMELINA. *C. cœlestis*.

— *Sellowiana*: *C. nudiflora*.

COMPTONIA. **C. asplenifolia*.
— *C. peregrina*: **C. asplenifolia*.
CONOCLINIUM. *C. caelestinum*:
Eupatorium caelestinum.
CONVALLARIA. *C. majalis* (Lily-of-the-Valley).
— *Polygonatum*: probably *Polygonatum officinale*.
CONVOLVULUS. *C. aureus*.
— *japonicus*.
— *major*: *Ipomoea purpurea*.
— *mauritanicus*.
— *minor*: *C. tricolor*.
— *purpureus*: *Ipomoea purpurea*.
— *splendens*: possibly *Argyrea splendens* (page 3566).
— *tricolor*.
COOPERIA. *C. Drummondii*.
— *pedunculata*.
COPROSMA. **C. Baueri*.
— *Baueriana*: **C. Baueri*.
COPTIS. *C. trifolia*.
CORCHORUS. *C. japonicus*: **Keria japonica*.
CORDIA. **C. Francisci* (not spelled *Francisi*).
CORDYLINE (see *Dracæna*). *C. australis* (*Dracæna*).
— *indivisa* (*Dracæna*).
COREOPSIS (*Calliopsis*). *C. auriculata*: probably *C. pubescens*, but perhaps means *C. auriculata*, Linn.
— *bicolor*: *C. tinctoria*.
— *coronata*.
— *Drummondii*.
— *floribunda*: not identified.
— *grandiflora*.
— *lanceolata*.
— *palmata*.
— *radiata*.
— *rosea*.
— *senifolia*: *C. major*.
— *tinctoria*.
— *verticillata*.
CORNUS. **C. alba*.
— **alternifolia*.
— **Amomum*.
— **Baileyi*.
— **brachypoda*; but the plant in cultivation is probably sometimes *C. controversa*.
— **canadensis*.
— *candidissima*: *C. racemosa*: **C. paniculata*.
— **capitata*.
— *circinata*: **C. rugosa*.
— *elegantissima*: probably **C. mas elegantissima*.
— **florida*.
— *Gouchaultii*: **C. alba Gouchaultii*.
— **Kousa*.
— **mas*.
— *mascula*: **C. mas*.
— **Nuttallii*.
— **officinalis*.
— **paniculata*: *C. racemosa*.
— **sanguinea*.
— *sericea*: **C. Amomum*.
— *sibirica*: **C. alba sibirica*.
— *Spaethii*: **C. alba Spaethii*.
— **stolonifera*.

CORONILLA. **C. Emerus*.
— *glauca*.
— *varia*.
CORTADERIA. *C. argentea* (Gynerium).
— *jubata*: *C. Quila*.
CORYDALIS. *C. nobilis*.
CORYLOPSIS. **C. spicata*.
CORYLUS. **C. americana*.
— *atropurpurea*: **C. Avellana atropurpurea*.
— **Avellana*.
— **maxima*.
— *pendula*: **C. Avellana pendula*.
— **rostrata*.
CORYNOCARPUS. **C. lævigata*.
CORYPHA. *C. australis*: *Livistona australis*.
COSMIDIUM. *C. Burridgeanum*:
Thelesperma hybridum.
COSMOS. *C. bipinnatus*.
— *diversifolius* (*Bidens*).
— *sulphureus*.
COTINUS. *C. americanus*: **Rhus cotinoides*.
— *Coggygia*: **Rhus Cotinus*.
COTONEASTER. **C. acuminata*.
— *angustifolia*: **Pyracantha angustifolia*.
— *buxifolia*: the plant usually sold under this name is **C. rotundifolia lanata*, not *C. buxifolia* of botanists.
— *crenulata*: **Pyracantha crenulata*.
— *Davidiana*: **C. horizontalis*.
— **foveolata*.
— **Franchetii*.
— **frigida*.
— **horizontalis*.
— **integerrima*.
— **microphylla*.
— **pannosa*.
— **salicifolia*.
— **Simonsii*.
— *Wheeleri*: the plant cultivated under this name is probably either *C. racemiflora orbicularis* or *C. rotundifolia lanata*.
COTYLEDON. *C. secunda*: *Echeveria secunda* (but equally correct as *Cotyledon*).
CRAMBE. *C. cordifolia*.
— *maritima*.
CRANIOULARIA. *C. annua* (*Martynia*).
CRASSULA. *C. coccinea*: *Roclea coccinea*.
CRATÆGUS. **C. arkansana*.
— **Arnoldiana*.
— **Barryana*.
— **Carrieri*.
— **coccinea*: several species may pass under this name; it is difficult to know to what species the Linnean name *C. coccinea* should apply.
— **coloradensis* (page 3567).
— **cordata*: *C. Phœnopyrum*.
— *crenulata*: **Pyracantha crenulata*.

CRATÆGUS, continued.

— **Crus-galli*.
— **cuneata*.
— **Eliwangeriana*.
— *glandulosa*: **C. rotundifolia*.
— *Lalandii*: **Pyracantha coccinea* Lalandii.
— **macrantha*.
— **mollis*.
— **monogyna*.
— **nigra*.
— **nitida*.
— **Oxyantha*; also misapplied to *C. monogyna*.
— **prunifolia*.
— **punctata*.
— *Pyracantha*: **Pyracantha coccinea*.
— **tomentosa*.

CRESCENTIA. *C. Cujete* (*Calabash*).

CRINUM. *C. amabile*.

— *asiaticum*.
— *fimbriatulum*.
— *Kirkii*.
— *longifolium*.
— *Moorei*.
— *Powellii*.

CROCOSMIA. *C. aurea*.

CROCUS. *C. biflorus*.
— *susianus*.
— *vernus*.

CROTON. *C. Andreanus*: *Codiaeum variegatum Andreanum*.

— *Bergmanii*: *Codiaeum variegatum Bergmanii*.
— *Cronstadii*: *Codiaeum variegatum Cronstadii* (proper spelling is not *Cronstadii*).
— *edmontonensis*: *Codiaeum variegatum edmontonense*.
— *Eversianus*: *Codiaeum variegatum Eversianum*.
— *fuscatus*: *Codiaeum variegatum fuscum*.
— *inimitabilis*: *Codiaeum variegatum inimitabile*.
— *maculatus*: *Codiaeum variegatum maculatum*.
— *musaicus*: *Codiaeum variegatum musaicum*.
— *punctatus*: *Codiaeum variegatum punctatum*.
— *Reedii*: *Codiaeum variegatum Reidii*.
— *superbus*: *Codiaeum variegatum superbum*.
— *Thompsonii*: *Codiaeum variegatum Thomsonii*.

The following trade-names are probably horticultural forms of *Codiaeum variegatum*: Bausei, brilliantissimus, Chartieri, Craigii, delicatissimus, Leonii, Mortii, Pucciana, Wardelii, and others.

CRUCIANELLA. *C. stylosa*.CRYPTOGRAMMA. *C. acrostichoides*.

CRYPTOMERIA. *C. elegans*: **C. japonica elegans*.
— **japonica*.

- CUCUMIS.** *C. acutangulus*: Luffa acutangula.
 — *Anguria* (Gherkin).
 — *erinaceus*: *C. dipsaceus*.
 — *flexuosus*: *C. Melo flexuosus*.
 — *grossulariaeformis*: *C. Anguria*.
 — *Melo* (Melon).
 — *odoratissimus*: *C. Melo Dudaim*.
 — *perennis*: *Cucurbita foetidissima*.
 — *sativus* (Cucumber).
CUCURBITA. *C. foetidissima* (Cucumis).
 — *maxima*.
 — *moschata*.
 — *Pepo*.
CUNNINGHAMIA. *C. sinensis*: **C. lanceolata*.
CUPHEA. *C. compacta*: *C. miniata compacta*.
 — *emineus*: *C. micropetala*.
 — *hyssopifolia*.
 — *miniata*.
 — *platycentra*: *C. ignea*.
 — *purpurea*.
 — *Roetzii*: *C. Hookeriana* (page 3567).
 — *strigulosa*: *C. cyanea*, not *C. strigulosa* of botanists.
 — *tricolor*: *C. jorullensis* (page 3567).
CUPRESSUS. **C. arizonica*.
 — **Benthamii*.
 — *elegans*: **C. Benthamii Knightiana*.
 — *excelsa*: **C. Benthamii*.
 — **funnebris*.
 — **glauca*: either *C. Goveniana glauca* or *C. lusitanica*.
 — **Goveniana*.
 — **guadalupensis*.
 — *horizontalis*: **C. sempervirens horizontalis*.
 — *Knightiana*: **C. Benthamii Knightiana*.
 — *Lambertiana*: **C. macrocarpa Lambertiana*.
 — *Lawsoniana*: **Chamaecyparis Lawsoniana*.
 — **lusitanica*.
 — **Macnabiana*.
 — **macrocarpa*.
 — *majestica*: **C. torulosa majestica*.
 — *nukaensis*: **Chamaecyparis nootkatensis*.
 — *pyramidalis*: **C. sempervirens stricta*, Ait. (rather than *C. sempervirens fastigiata*).
 — **sempervirens*.
 — **torulosa*.
CYBOTIUM. *C. Schiedei*: *Cibotium Schiedei*.
CYCAS. *C. revoluta*.
CYCLAMEN. *C. europæum*.
 — *giganteum*: *C. persicum giganteum*.
 — *hederæfolium*: probably *C. persicum*, but possibly *C. neapolitanum*.
 — *latifolium*: *C. persicum*.
 — *persicum*.
 — *repandum*.
CYCLOBOTHRA. *C. flava*: *Calochortus flavus*.
CYCLOPHORUS. *C. Lingua* (*Niphobolus*).
CYDONIA. *C. alba*: *Chænomeles lagenaria* var. (page 3567) (*C. japonica* of literature): **Cydonia japonica alba*.
 — **japonica*: *Chæn. japonica* but more correctly *Chæn. lagenaria* (page 3567).
 — **Maulei*: *Chæn. Maulei* of literature but more correctly *Chæn. japonica* (page 3567).
 — **oblonga* (Quince).
 — *umbilicata*: *Chæn. japonica umbilicata*, but more correctly *Chæn. lagenaria umbilicata*: **Cy. japonica umbilicata*.
 — *vulgaris*: **C. oblonga*.
CYNANCHUM. *C. acuminatifolium* (*Vincetoxicum*).
CYNARA. *C. Cardunculus* (Cardoon).
 — *C. Scolymus* (Artichoke).
CYNOGLOSSUM. *C. linifolium*: *Omphalodes linifolia*.
 — *nervosum* (page 3567).
CYPERUS. *C. adenophorus* (page 3567).
 — *alternifolius*.
 — *esculentus* (Chufa).
 — *Papyrus* (*Papyrus*).
CYPHOMANDRA. *C. betacea*.
CYPRIPEDIUM. *C. acaule*.
 — *hirsutum*: *C. reginæ* (known also as *C. spectabile*).
 — *parviflorum*.
 — *pubescens*.
 — *Reginæ*.
 — *spectabile*: *C. reginæ* (*C. spectabile* is not tenable).
CYRTOMIUM. *C. caryotideum*.
 — *falcatum*.
 — *Fortunei*.
 — *Rochfordianum*; a variation of *C. falcatum*.
CYSTOPTERIS. *C. bulbifera*.
 — *fragilis*.
CYTISUS. *C. albus*. Name applied to different plants; likely to be *C. leucanthus* or *C. multiflorus*, or possibly *C. purpureus albus*, *C. præcox* or *C. scoparius albus*.
 — *alpinus*: **Laburnum alpinum*.
 — *Andreanus*: **C. scoparius Andreanus*.
 — **canariensis*.
 — *candicans*: **C. monspessulanus*.
 — **fragrans*.
 — *hispanicus*: **Genista hispanica*.
 — *Laburnum*: *Laburnum anagyroides*: **L. vulgare*.
 — **multiflorus* (*Genista*).
 — **nigricans*.
 — **præcox*.
 — *racemosus*; but the plant in cultivation is perhaps *C. maderensis magnifolius*.
 — *schipkaensis*: **C. leucanthus schipkaensis*.
 — **scoparius*.
 — **sessilifolius*.
 — **triflorus*.
 — *Watereri*: **Laburnum Watereri*.
DACTYLIS. *D. glomerata*.
DÆMONOROPS. *D. fissus* (page 3568).
DAHLIA. *D. arborea*: *D. excelsa*.
 — *coccinea*.
 — *excelsa*.
 — *Juarezii*.
 — *variabilis*: *D. rosea*.
DALIBARDA. *D. repens*.
DAPHNE. **D. Cneorum*.
 — *Fioniana*: **D. oleoides Fioniana*.
 — **Genkwa*.
 — **Mezereum*.
 — **odora*.
 — **oleoides*.
DAPHNIPHYLLUM. **D. macro-podon*.
DARLINGTONIA. *D. californica*.
DASYLIRION. *D. acrotriche*.
 — *glaucophyllum*.
 — *graminifolium*.
 — *Parryi*: *Nolina Parryi*.
 — *quadrangulatum*: *D. longissimum*.
 — *serratifolium*.
 — *Wheeleri*.
DATURA. *D. arborea* (*Brugmansia*).
 — *cornigera*.
 — *cornucopia*: *D. fastuosa*.
 — *humilis*.
 — *meteloides*.
 — *sanguinea*.
DAUCUS. *P. Carota* (*Carrot*).
DAVALLIA. *D. tenuifolia*: *Odontosoria chinensis*.
DECKENIA (*Deckeria*). *D. nobilis* (page 3568).
DECUMARIA. **D. barbara*.
DEERINGIA. *D. celosioides*: **D. baccata*.
DELPHINIUM. *D. Ajacis*.
 — *Barlowii*: *D. hybridum Barlowii*.
 — *Brunonianum*.
 — *cardinale*.
 — *cardiopetalum*.
 — *cashmerianum*.
 — *caucasicum*.
 — *chinense*: *D. grandiflorum chinense*.
 — *Consolida*.
 — *elatum*.
 — *formosum*.
 — *grandiflorum*.
 — *hybridum*.
 — *Maackianum*.
 — *Moerheimeii*.
 — *nudicaule*.
 — *speciosum* (page 3568).
 — *Zalil*.
 Many *Delphinium* names, as *D. belladonna*, are of garden forms.
DENDRIUM (American Code name).
D. buxifolium: **Leiophyllum buxifolium*.
 — *prostratum*: **L. buxifolium prostratum*.
DENDROCALAMUS. *D. latiflorus*.
DENDROMECON. *D. rigidum*.
DENDROPANAX. **D. japonicum* (see note under *Acanthopanax*).
DENNSTÆDTIA. *D. cicutaria* (*Sitobolium*).
 — *punctilobula* (*Dicksonia*).
DENTARIA. *D. diphylla*.
DESMAZERIA. *D. sicala* (*Brizopyrum*).

DESMODIUM. *D. bicolor*: *Lespedeza bicolor.
— *japonicum*: *L. japonica*.
— *penduliflorum*: *L. formosa*, Koehne (*L. Sieboldii* not tenable under the rules).

DEUTZIA. *D. candidissima*: **D. scabra candidissima*.
— *corymbiflora*: **D. setchuenensis corymbiflora*.
— *crenata*: **D. scabra crenata*.
— **discolor*.
— *Fortunei*: **D. scabra Fortunei*.
— **gracilis*.
— **Lemoinei*.
— **myriantha*.
— **parviflora*.
— **scabra*.
— **Schneideriana*.
— **Vilmorinæ*.
— *Watereri*: **D. scabra Watereri*.

DIANTHUS. *D. atrorubens*: *D. carthusianorum*.
— *barbatus*.
— *cæsius*.
— *Caryophyllus* (Carnation).
— *chinensis*.
— *cruentus*.
— *deltoides*.
— *diadematus*.
— *glacialis*.
— *Heddewigii*: *D. chinensis Heddewigii*.
— *imperialis*.
— *laciniatus*: *D. chinensis laciniatus*.
— *latifolius*.
— *marginatus* (page 3568).
— *neglectus*: *D. glacialis neglectus*.
— *plumarius*.
— *punctatus*: a form of *D. Caryophyllus*, not *D. punctatus* of botanists.
— *scoticus*: *D. plumarius*.
— *Seguieri*: *D. chinensis asper*.
— *semperflorens*; some of the stock is probably *D. plumarius semperflorens*.
Latin names of *Dianthus* are likely to represent garden forms, as *albus plenus*, *mirabilis*, *multiflorus*, *nanus*, and others.
— *superbus*.

DIASCIA. *D. Barberæ*.

DICENTRA (*Bicuculla*). *D. canadensis*.
— *chrysantha*.
— *Cucullaria*.
— *eximia*.
— *formosa*.
— *spectabilis* (*Dielytra*).

DICKSONIA. *D. punctilobula*: *Dennstaedtia punctilobula*.

DICTAMNUS. *D. albus*.
— *caucasicus*: *D. albus caucasicus*.
— *Fraxinella*: *D. albus*.
— *ruber*: *D. albus ruber*.

DIDISCUS. *D. cærulea*: *Trachymene cærulea*.

DIEFFENBACHIA. *D. magnifica*.
— *splendens*.

DIELYTRA. *D. spectabilis*: *Dicentra spectabilis*.

DIERVILLA (*Weigela*). *D. amabilis*: the plant in cultivation is likely to be either *D. florida* or *D. coraënsis*, probably the former: **Weigela amabilis*.

— *candida*: *D. hybrida candida*: **W. candida*.
— *Desboisii*: *D. hybrida Desboisii*: **W. Desboisii*.
— *floribunda*: **W. floribunda*.
— *florida*: **W. rosea*.
— *Hendersonii*: *D. hybrida Hendersonii*: **W. Hendersonii*.
— *hybrida*: **Weigela hybrida*.
— *japonica*: **W. japonica*.
— *Lavallei*: *D. hybrida Lavallei*: **W. Lavallei*.
— *Lonicera*: **D. trifida*.
— *lutea*: the plant in the trade under this name is declared to be **D. sessilifolia*.
— **rivularis*.
— *rosea*: *D. florida*: **W. rosea*.
— **sessilifolia*.
— *Steltzneri*: *D. hybrida Steltzneri*: **W. Steltzneri*.
— **trifida*: *D. Lonicera*.
— *Van Houttei*: *D. hybrida Van Houttei*: **W. Van Houttei*.
— *Verschaffeltii*: *D. hybrida Verschaffeltii*: **W. Verschaffeltii*.
DIGITALIS. *D. alba*: probably *D. purpurea alba*.
— *ambigua*.
— *gloxiniæflora*: *D. purpurea gloxiniflora*.
— *grandiflora*: *D. ambigua*.
— *lanata*.
— *maculata*.
— *monstrosa*: *D. purpurea monstrosa*.
— *purpurea*.
— *sibirica*.

DIMORPHANTHUS. *D. mand-schuricus*: **Aralia chinensis mandschurica*.

DIMORPHOTHECA. *D. annua* (*Calendula*).

— *aurantiaca*.
— *sinuata*.

DIONÆA. *D. muscipula*.

DIOSCOREA. *D. alata*.

— *Batatas*.
— *bulbifera*.

DIOSMA. *D. ericoides*.

— *purpurea*: usually *Agathosma villosa*, but sometimes *A. Ventenatiana*.

DIOSPYROS. **D. Kaki*.

— **Lotus*.
— **virginiana*.

DIOTIS. *D. candidissima* (*Santolina*).

DIPLADENIA. *D. splendens*.

DIPSACUS. *D. fullonum* (Teasel).

DIRCA. **D. palustris*.

DIZYGOTHECA. *D. elegantissima* (*Aralia*).

— *Kerchoveana* (*Aralia*).
— *Veitchii* (*Aralia*. *Panax*).

DODECATHEON. *D. Clevelandii*.
— *Hendersonii*.

DODECATHEON, continued.

— *Jeffreyi*.

— *Media*.

— *radicatum*.

DODONÆA. **D. cuneata*.

DOLICHOS. **D. biflorus*.

— **giganteus*: a form of *D. Lablab*.
— *japonicus*: *Pueraria hirsuta*: **P. Thunbergiana*.

— **Lablab*.

— **lignosus*.

— *sesquipedalis*: **Vigna sesquipedalis*.

DORONICUM. *D. austriacum*.

— *caucasicum*.

— *Clusii*.

— *excelsum*: *D. plantagineum excelsum*.

— *magnificum*.

— *plantagineum*.

DRABA. *D. androsacea*: *D. fladnizensis*.

DRACÆNA. *D. amabilis*: *Cordylina amabilis*, a form of *C. terminalis*.

— *australis*: *C. australis*.

— *Baptistii*: *C. Baptistii*, a form of *C. terminalis*.

— *deremensis*.

— *Draco*.

— *fragens*.

— *Godseffiana*.

— *Goldieana*.

— *imperialis*: *C. imperialis*, a form of *C. terminalis*.

— *indivisa*: *C. indivisa*; but often applied to *C. australis*.

— *Knerkii*, a form of *D. fragrans*.

— *Lindenii*: *D. fragrans Lindenii*.

— *Massangeana*: *D. fragrans Massangeana*.

— *Rothiana*.

— *Sanderiana*.

— *Shepherdii*, unknown botanically.

— *terminalis*: *Cordylina terminalis*.

— *Veitchii*: *C. australis Veitchii*.

— *Youngii*: *C. Youngii*, a form of *C. terminalis*.

Other *Dracæna* names are in the trade, probably forms of species of *Cordylina*, as *Albertii*, *Doucetii* (*C. australis Doucetiana*), *lineata* (*Cordylina terminalis*) *Parrei*, *Storyi*, and others.

DRACOCEPHALUM. *D. argunense*: **D. Ruyschiana*.

— *grandiflorum*.

— *Moldavica*.

— *Ruyschiana*.

DRACUNCULUS. *D. vulgaris* (*Arum*).

DROSERA. *D. filiformis*.

— *rotundifolia*.

DRYOPTERIS. Accepted name for certain species listed under *Aspidium*.

— *hirtipes* (*Nephrodium*).

DUCHESNEA. *D. indica* (*Fragaria*).

DURANTA. *D. Plumieri*.

ECBALLIUM. *E. Elaterium* (*Momordica*).

ECCREMOCARPUS. *E. scaber* (*Calampelis*).

- ECHEVERIA** (see *Cotyledon*): *E. agavoides*: *Cotyledon agavoides* (but equally correct as *E. agavoides*).
 — *metallica*: *E. gibbiflora metallica*.
 — *secunda* (*Cotyledon*).
- ECHINACEA** (*Brauneria*). *E. angustifolia*.
 — *intermedia*: *E. purpurea serotina*.
 — *purpurea*.

 — *odora*.
 — **piperita*.
 — **polyanthemos*.
 — **resinifera*.
 — **robusta*.
 — **rostrata*.
 — **rudis*.
 — **siderophloia*.
 — **sideroxydon*.
 — **Stuartiana*.
 — **tereticornis*.
 — **viminalis*.
 — **virgata*.
- EUCHARIDIUM**. *E. grandiflorum*.

EUCHARIS. *E. amazonica*: *E. grandiflora*.

EUCHLÆNA. *E. mexicana*.

EUGENIA. **E. apiculata* (Myrtus).

— *E. aromatica* (Clove); by some recent botanists separated as *Caryophyllus aromaticus*.

— *jambolana*; by some recent authors separated as *Syzygium jambolanum*.

— *Jambos*.

— *Micheli*: **E. uniflora*.

— **microphylla*.

— **myrtifolia*.

— *operculata*: correctly placed either here or as *Syzygium operculatum*.

— **uniflora*.

EULALIA. *E. gracillima*: *Miscanthus sinensis gracillimus*.

— *japonica*: *M. sinensis*.

— *variegata*: *M. sinensis variegatus*.

— *zebrina*: *M. sinensis zebrinus*.

EUONYMUS. See *Evonymus*.

EUPATORIUM. *E. ageratoides*: *E. urticæfolium*.

— *album*.

— *aromaticum*.

— *caelestinum*.

— *Fraseri*: *E. aromaticum melissoides*.

— *glechonophyllum* (*Ageratum*).

— *Lasseauxii* (*Ageratum*).

— *micranthum* (*Ageratum*).

— *perfoliatum*.

— *purpureum*.

— *serotinum* (page 3568).

— *urticæfolium*.

EUPHORBIA. *E. corollata*.

— *Cyparissias*.

— *fulgens*.

— *heterophylla*.

— *marginata*.

— *polychroma*: *E. epithymoides*.

— *pulcherrima*: **Poinsettia pulcherrima*.

— *splendens*.

— *variegata*: *E. marginata*.

EURYA. *E. latifolia*: *E. japonica*.

EUSTOMA. *E. Russellianus* (*Lisianthus*).

EUTOCA. *E. multiflora*: *Phacelia linearis*.

— *viscida*: *P. viscida*.

EVONYMUS. (The preference for *Evonymus* over *Euonymus* lies in this use of the word by Linnaeus. The former is now generally accepted on the continent of Europe and by some American botanists, as in Gray's Manual. A comparable case is the spelling *Zanthoxylum* rather than *Xanthoxylum*. The American Joint Committee on Horticultural Nomenclature adopts the spelling **Euonymus*. Some treat the name as feminine and others as masculine.)

— *alata*: **Euonymus alatus*.

— *americana*: **Euon. americanus*.

— *atropurpurea*: **Euon. atropurpureus*; sometimes misapplied to *E. europæa atropurpurea*.

EVONYMUS, continued.

— *Bungeana*: **Euon. Bungeanus*.

— *Carrierei*: **Euon. radicans Carrierei*.

— *europæa*: **Euon. europæus*.

— *japonica*: **Euon. japonicus*.

— *kewensis*: *E. radicans minima*: **Euon. radicans minimus*.

— *latifolia*: **Euon. latifolius*.

— *nana*; but the plant in cultivation may be *E. europæa nana*: **Euon. europæus nanus*.

— *obovata*: **Euon. obovatus*.

— *radicans*.

— *radicans reticulata*: **Euon. radicans reticulatus*.

— *Sieboldiana*: The true *E. Sieboldiana* is not introduced; the plants cult. under this name are *E. Bungeana semipersistens*, *E. patens*, or *E. yedoensis*.

— *vegeta*: *E. radicans vegeta*: **Euon. radicans vegetus*.

EXACUM. *E. affine*.

EXOCHORDA. **E. Giraldui*.

— **grandiflora*: *E. racemosa*.

— *Wilsonii*: **E. Giraldui Wilsonii*.

FABIANA. **F. imbricata*.

FAGOPYRUM. *F. esculentum* (Buckwheat).

— *tataricum* (India-Wheat).

FAGUS. **F. americana*: *F. grandifolia* (American Beech).

— *ferruginea*: *F. grandifolia*: **F. americana*.

— **sylvatica* (European Beech, purple-leaved and weeping forms).

FARFUGIUM. *F. argenteum*: *Ligularia Kaempferi argenteus*.

— *grande*: *L. Kaempferi aureo-maculatus*.

FATSIA. **F. japonica* (*Aralia*).

— *papyrifera*: **Tetrapanax papyrifera* by preference, although by many retained in *Fatsia*.

FEIJOA. *F. Sellowiana*.

FELICIA. *F. amelloides* (*Agathæa*).

FENZLIA. *F. dianthiflora*: *Gilia dianthoides*.

FERULA. *F. communis*.

FESTUCA. *F. elatior*.

— *glauca*.

FICUS. **F. altissima*.

— **Carica* (*Fig*).

— **elastica*.

— *lutescens*: **F. diversifolia*.

— **macrophylla*.

— **pandurata*.

— **pumila*.

— *repens*: **F. pumila*.

— **rubiginosa*.

— *ulmifolius* (page 3568).

— *utilis* (page 3568).

FILARIA (misspelling). See *Phillyrea*.

FILIPENDULA (see *Spiræa* and *Ulmaria*). *F. camtschatica*.

— *hexapetala*.

— *purpurea*.

— *rubra*.

— *Ulmaria*.

FITTONIA. *F. argyroneura*.

FORSYTHIA. *F. Fortunei*: **F. suspensa Fortunei*.

— **intermedia*.

— *Sieboldii*: **F. suspensa Sieboldii*.

— **suspensa*.

— **viridissima*.

FRAGARIA. *F. chiloensis*.

— *indica*: *Duchesnea indica*.

— *mexicana*.

— *vesca*.

— *virginiana*.

FRANCOA. *F. ramosa*.

FRAXINUS. *F. alba*: **F. americana*.

— **americana*.

— *aurea*: **F. excelsior aurea*.

— **excelsior*.

— **lanceolata*.

— *lentiscifolia*: **F. rotundifolia*.

— **mandschurica*.

— **nigra*.

— **oregona*.

— **Ornus*.

— **pennsylvanica*.

— *pubescens*: **F. pennsylvanica*.

— **quadrangulata*.

— **rotundifolia*.

— *sambucifolia*: **F. nigra*.

— *viridis*: **F. lanceolata*.

FREESIA. *F. alba*: *F. refracta alba*.

— *refracta*.

FREMONTIA. **F. californica*.

FRITILLARIA. *F. Imperialis*.

— *liliacea*.

— *meleagris*.

FUCHSIA. *F. conica*: *F. magellanica conica*.

— *globosa*: *F. magellanica globosa*.

— *gracilis*: *F. magellanica gracilis*.

— *hybrida*: *F. speciosa*.

— *magellanica*.

— *procumbens*.

— *Riccartonii*: *F. magellanica Riccartonii*.

— *speciosa*.

— *triphylla*.

FUNKIA. *F. alba*: *Hosta plantaginæa*.

— *aurea*: variegated forms of various species of *Hosta*.

— *cærulea*: *H. cærulea*.

— *Fortunei*: *H. Fortunei*, commonly cultivated as *F. Sieboldiana*.

— *gigantea*: *H. Fortunei gigantea*.

— *grandiflora*: *H. plantaginæa grandiflora*.

— *japonica*: usually *H. plantaginæa*, but may be *H. lancifolia*.

— *lanceolata*: *H. cærulea*.

— *lancifolia*: *H. lancifolia*.

— *ovata*: *H. cærulea*.

— *robusta*: *H. Fortunei robusta*.

— *Sieboldiana*: *H. Sieboldiana*, but much of the stock is *H. Fortunei*.

— *subcordata*: *H. plantaginæa*.

— *undulata*: *H. lancifolia undulata*.

— *variegata*: variegated forms of various species of *Hosta*.

GAILLARDIA. *G. amblyodon*.

— *aristata*.

— *grandiflora*: *G. aristata*.

— *kermesina*; a form of *G. aristata*.

— *Lorenziana*; a form of *G. pulchella picta*.

GAILLARDIA, continued.

- *maxima*: *G. aristata*.
- *picta*: *G. pulchella picta*.
- GALANTHUS**. *G. nivalis*.
- GALAX**. **G. aphylla*.
- GALEGA**. *G. bicolor*; probably a form of *G. officinalis* (page 3568).
- *Hartlandii*: *G. officinalis Hartlandii*.
- *officinalis*.
- GALEORCHIS**. See *Orchis*.
- GALIUM**. *G. boreale*.
- GALTONIA**. *G. candicans* (*Hya-cinthus*).
- GAMOLEPIS**. *G. Tagetes*.
- GARCINIA**. *G. Mangostana* (*Mangosteen*).
- GARDENIA**. **G. florida*: *G. jasminoides*.
- **Fortunei*: *G. jasminoides Fortuniana*.
- **radicans*: *G. jasminoides*.
- **Veitchii*; probably a form of *G. jasminoides*.
- GARRYA**. **G. elliptica*.
- GAULTHERIA**. **G. procumbens*.
- **Shallon*.
- GAURA**. *G. Lindheimeri*.
- GAYLUSSACIA**. **G. frondosa*.
- *resinosa*: **G. baccata*.
- **ursina*.
- GAZANIA**. *G. longiscapa*.
- *splendens*.
- GELSEMIUM**. **G. sempervirens*.
- GENISTA**. **G. ætensis*.
- *alba*: **Cytisus multiflorus*.
- *Andreana*: **C. scoparius Andreanus*.
- *canariensis*: **C. canariensis*.
- *fragrans*: **C. fragrans*.
- **hispanica* (*Cytisus*).
- *juncea*: **Spartium junceum*.
- **monosperma*.
- *racemosa*: **C. racemosus*.
- *scoparia*: **C. scoparius*.
- *tibetica* (page 3568).
- **tinctoria*.
- GENTIANA**. *G. acaulis*.
- *Andrewsii*.
- *asclepiadea*.
- *crinita*.
- *Cruciata*.
- *iutea*.
- *scabra*.
- GERANIUM**. *G. album*: applies probably to *G. ibericum album*, *G. pratense album* or *G. maculatum album*.
- *armenum*.
- *citriodorum*: *Pelargonium acerifolium*.
- *collinum*.
- *Fremontii*.
- *grandiflorum*.
- *ibericum*.
- *Londesii*: *G. collinum*.
- *maculatum*.
- *platypetalum*: *G. ibericum platypetalum*.
- *pratense*.
- *Robertianum*.

GERANIUM, continued.

- *sanguineum*.
- *zonale*: *Pelargonium zonale*.
- GERARDIA**. *G. hybrida*.
- GERBERA**. *G. Jamesonii*.
- GESNERIA**. *G. macrantha*: *G. cardinalis*.
- GEUM**. *G. atrosanguineum*; probably a form of *G. chilense*.
- *bulgaricum*: botanically unknown.
- *chilense*.
- *coccineum*, but sometimes *G. chilense*.
- *Heldreichii*; probably a form of *G. montanum*.
- *japonicum*.
- *miniaturum*: *G. chilense miniaturum*.
- GILIA**. *G. achilleæfolia*.
- *androsacea* (*Leptosiphon*).
- *capitata*.
- *coronopifolia* (*Ipomopsis*).
- *densiflora* (*Leptosiphon*).
- *dianthoides* (*Fenzlia*).
- *laciniata*.
- *liniflora*.
- *micrantha* (*Leptosiphon*).
- *nivalis*: a white form of *G. tricolor*.
- GILLENIA**. *G. stipulata* (*Porteranthus*).
- *trifoliata*.
- GINKGO** (*Salisburia*). **G. biloba*.
- GLADIOLUS**. *G. brenchleyensis*.
- *Childsii*.
- *gandavensis*.
- *Kunderdii*.
- *nanceianus*.
- *primulinus*.
- *princeps*.

The cultivated forms of *Gladiolus* are not clearly referable to botanical species.

- GLAUCIUM**. *G. luteum*: *G. flavum*.
- GLECHOMA**. *G. variegata*: *Nepeta hederacea variegata*.
- GLEDITSIA** (*Gleditschia*). **G. japonica*.
- **sinensis*.
- **triacanthos*.
- GLOBULARIA**. *G. trichosantha*.
- GLORIOSA**. *G. Rothschildiana*.
- *superba*.
- GLOXINIA** (the florists' *Gloxinia* is *Sinningia speciosa*). *G. crassifolia*: a strain of *Sinningia speciosa*.
- *gigantea*: a form of *S. speciosa*.
- GLYCINE**. *G. Soja* (*Soybean*). (Under the American Code *Glycine* replaces *Apios*, and the soybean becomes *Soja max*, *Piper*.)
- GLYCYRRHIZA**. *G. glabra*.
- GNAPHALIUM**. *G. lanatum*: *Helichrysum petiolatum*.
- *Leontopodium*: *Leontopodium alpinum*.
- GODETIA**. *G. amœna*.
- *grandiflora*.
- *Lindleyi*: *Enothera Lindleyi*, a form of *G. amœna*.
- *rubicunda*: a form of *G. amœna*.
- *Schwaminii*: a form of *G. amœna*.
- *Whitneyi*: *G. grandiflora*.

- GOMPHRENA**. *G. aurea*: *G. globosa aurea*.
- *globosa*.
- GONIOPHLEBIUM**. *G. subauriculatum*: *Polypodium subauriculatum*.
- GOODYERA** (much difference of opinion exists as to the merits of this name, but it is retained by some recent orchid students and is probably tenable). *G. Menziesii*: *G. decipiens* (rather than *G. Menziesii* as on page 1357).
- *pubescens*.
- *repens*.
- GRAMMANTHES**. *G. gentianoides*: *G. dichotoma*.
- GREVILLEA**. **G. robusta*.
- **Thelemanniana*.
- GUNNERA**. *G. manicata*.
- *scabra*: *G. chilensis*.
- GYMNOCLADUS**. *G. canadensis*.
- **G. dioica*.
- GYMNOGRAMMA**. *G. sulphurea*: *Ceropteris sulphurea*.
- GYMNOTHRIX**. *G. japonica*: *Pen-nisetum japonicum*.
- *latifolia*: *P. latifolium*.
- GYNERIUM**. *G. argenteum*: *Cor-taderia argentea*.
- *jubatum*: *C. Quila*.
- GYPSOPHILA**. *G. acutifolia*.
- *cerastioides*.
- *elegans*.
- *muralis*.
- *paniculata*.
- **repens*.
- HABENARIA**. *H. biephariglottis*.
- *bracteata*.
- *cliaris*.
- *dilatata*.
- *Hookeriana*.
- *hyperborea*.
- *psycodes*.
- HABROTHAMNUS**. *H. elegans*: *Cestrum elegans*.
- *fasciculatus*: *C. fasciculatum*.
- HÆMANTHUS**. *H. albiglora*: *H. albiflos*.
- *coccineus*.
- *puniceus*.
- HAKEA**. **H. elliptica*.
- **laurina*.
- **saligna*.
- **suaveolens*.
- HALESIA**. *H. caroliniana*: *H. carolina*.
- **H. tetraptera*.
- **diptera*.
- **tetraptera*: *H. carolina*.
- HAMAMELIS**. **H. japonica*.
- **mollis*.
- **virginiana*.
- *virginica*: **H. virginiana*.
- *Zuccariniana*: **H. japonica Zuccariniana*.
- HARDENBERGIA**. **H. Comptoniana*.
- *hibernica*: **H. helix hibernica*.
- **monophylla*.
- HEDERA**. *H. algeriensis*: **H. canariensis*.
- **helix*.
- *maculata*: **H. helix maculata*.

HEDERA, continued.

- *maderensis*: *H. canariensis.
- *Rægeriana*: *H. colchica.
- *variegata*: *H. canariensis variegata.

HEDYSARUM. *H. coronarium.
— *multijugum.

HELENIUM. H. autumnale.

- *Bigelovii*.
- *Hoopesii*.
- *pumilum*: probably H. autumnale pumilum.
- *tenuifolium*.

HELIANTHELLA. H. quinque-nervis.

HELIANTHEMUM. *H. alpestre.

- *croceum*: *H. glaucum croceum.
- *multiflorum*: probably H. halimifolium multiflorum.
- *mutabile*: *H. Chamæcistus mutabile.
- *polifolium*: *H. Chamæcistus tomentosum.
- *vulgare*: *H. Chamæcistus.

HELIANTHUS. H. annuus.

- *argyrophyllus*.
- *californicus*: probably H. californicus, but perhaps means H. annuus californicus in some lists.
- *cucumerifolius*: H. debilis.
- *decapetalus*.
- *giganteus*.
- *globosus*: H. annuus globosus.
- *macrophyllus*: H. strumosus macrophyllus.
- *Maximilianus*: H. Maximilianii.
- *mollis*.
- *multiflorus*: H. decapetalus multiflorus.
- *nanus*: H. annuus nanus.
- *orgyalis*: H. orgyalis.
- *rigidus*: H. scaberrimus.
- *sparsifolius*: H. atrorubens.
- *tuberosus*.

HELICHRYSUM. H. angustifolium (page 3568).

- *bracteatum*.
- *monstrosum*: double forms of H. bracteatum.
- *petiolatum* (Gnaphalium).

HELICODICEROS. H. muscivorus (Arum).

HELICONIA. H. aurea: H. aureo-striata.

HELIOPSIS. H. laevis: H. helianthoides.

- *Pitcheriana*: H. helianthoides Pitcheriana.
- *scabra*.

HELIOTROPIUM. H. peruvianum.

- *HELIPETERUM*. H. album: H. roseum album (Acroclinium).
- *corymbiflorum*.
- *Manglesii* (Rhodanthe).
- *roseum* (Acroclinium).
- *Sanfordii*: H. Humboldtianum.

HELLEBORUS. H. niger.

HELONIAS. H. bullata.

HEMEROCALLIS. H. aurantiaca.

- *citrina*.
- *disticha*: H. fulva.
- *Dumortieri*.
- *flava*.

HEMEROCALLIS, continued.

- *fulva*.
- *Kwanso*: H. fulva Kwanso.
- *luteola*.
- *Middendorffii*.
- *minor*.
- *Sieboldii*: H. Dumortieri.
- *Thunbergii*.

HEPATIC. H. acutiloba (Anemone).

- *angulosa*.
- *triloba* (Anemone).

HERACLEUM. H. giganteum: H. villosum.

HERNIARIA. H. glabra.

HESPERIS. H. matronalis.

HESPEROYUCCA. *H. Whipplei (Yucca).

HETEROCENTRON. H. mexicanum: *H. roseum.

HETEROMELES. H. arbutifolia: *Photinia arbutifolia.

HEUCHERA. H. americana.

- *brizoides*.
- *gracillima*: H. sanguinea gracillima.
- *rubrifolia*: H. pubescens.
- *sanguinea*.

HEVEA. H. brasiliensis.

HIBBERTIA. *H. volubilis.

HIBISCUS. H. africanus: H. Trionum.

- *coccineus*.
- *cruentus*: form of H. Rosa-sinensis probably (page 3568).
- *elatus* (Paritium).
- *esculentus* (Okra).
- *grandiflorus*.
- *Lambertianus*: form of H. Rosa-sinensis probably (page 3569).
- *Manihot*.
- *militaris*.
- *miniatus*: a form of H. Rosa-sinensis.
- *Moscheutos*.
- *mutabilis*.
- *oculiroseus*.
- *Rosa-sinensis*.
- *Sabdariffa* (Roselle).
- *schizopetalus*.
- *sinensis*: H. Rosa-sinensis.
- *subviolaceus*: a form of H. Rosa-sinensis.
- **syriacus* (Althæa).
- *tiliaceus* (Paritium).

HICORIA (see Carya). *H. alba (Mockernut): Carya alba.

- **cordiformis*: C. cordiformis.
- **glabra* (Pignut): C. glabra.
- **laciniosa* (Shellbark Hickory): C. laciniosa.
- *minima*: C. cordiformis: *H. cordiformis.
- **ovata* (Shagbark Hickory): C. ovata.
- **Pecan*: C. Pecan.
- *porcina* (Pignut): C. glabra: *H. glabra.
- *sulcata* (Shellbark Hickory): C. laciniosa: *H. laciniosa.
- *tomentosa* (Mockernut): C. alba: *H. alba.

HIERACIUM. H. aurantiacum.

- *villosum*.

HIPPEASTRUM. H. equestre (Amaryllis).

- *Johnsonii* (Amaryllis).
- *solandriflorum* (Amaryllis).
- *vittatum* (Amaryllis).

HIPPOPHAE. *H. rhamnoides.

HOLODISCUS. H. aræfolius: *H. discolor aræfolius.

HORDEUM. H. jubatum.

HOSTA (Funkia). H. cærulea.

- *Fortunei*.
- *lancifolia*.
- *plantaginea*.
- *Sieboldiana*.

HOUSTONIA. H. cærulea.

- *purpurea*.
- *serpyllifolia*.

HOVENIA. *H. dulcis.

HOWEA. H. Belmoreana (Kentia).

- *Forsteriana* (Kentia).

HOYA. H. carnosa.

HUMEA. H. elegans.

HUMULUS. *H. japonicus.

- **Lupulus* (Hop).
- *neo-mexicanus*: *H. Lupulus neo-mexicanus.

HUNNEMANNIA. H. fumarifolia.

HYACINTHUS. H. candicans: Galtonia candicans.

- *orientalis*.

HYDRANGEA. *H. arborescens.

- **Bretschneideri*.
- **cinerea*.

— *grandiflora*: name in trade distinguishes either *H. paniculata grandiflora or *H. arborescens grandiflora, usually the former.

— **hortensis*: plant in trade is probably H. opuloides Hortensia, possibly sometimes H. paniculata grandiflora.

— **monstrosa*: H. opuloides otaksa monstrosa.

- *nivea*: *H. radiata.

— **opuloides*.

- *otaksa*: *H. opuloides otaksa.

— **paniculata*.

- **petiolaris* (see Schizophragma)

— **quercifolia*.— **radiata*.

- *ramis pictis*: *H. opuloides cyano-clada.

— **rosea*: H. opuloides otaksa rosea.

- *scandens*: *H. petiolaris.

HYDRASTIS. H. canadensis.

HYDRIASTELE. H. Wendlandiana.

HYDROCLEIS. H. nymphoides (Limncharis).

HYMENOCALLIS. H. calathina (Ismene, Pancratium).

HYMENOSPORUM. *H. flavum.

HYOPHORBE. H. amaricaulis.

- *Verschaffeltii* (Areca).

HYPERICUM. *H. adpressum.

- **Arnoldianum*.

— **aureum*.

- **Buckleii*.

— **calycinum*.

- **densiflorum*.

— **elegans*.

- **galioides*.

HYPERICUM, continued.

- *hircinum.
- *Kalmianum.
- *lobocarpum.
- *Mosierianum.
- *patulum.
- *prolificum.

HYPOCHÆRIS. *H. uniflora*.HYPOXIS. *H. erecta*: *H. hirsuta*.HYSSOPUS. *H. officinalis*.IBERIS. *I. affinis*: *I. pectinata*.

- *amara*.
- *corifolia*: *I. saxatilis corifolia*.
- *coronaria*: *I. amara coronaria*, not *I. coronaria* of botanists.
- *gibraltarica*.
- *jucunda*: *Æthionema coridifolium*.
- *odorata*.
- *pectinata*.
- *saxatilis*.
- *sempervirens*.
- *Tenoreana*.
- *umbellata*.

ILEX. **I. Aquifolium*.

- *Cassine.
- *corallina.
- *crenata.
- *Dahoon*: **I. Cassine*.
- *decidua.
- *glabra.
- *monticola.
- *opaca.
- *pyramidalis*: **I. Aquifolium pyramidalis*.
- *serrata.
- *verticillata.
- *vomitoria.

ILICIUM. **I. anisatum*.IMPATIENS. *I. Balsamina* (Garden Balsam).

- *glanduligera*: *I. Roylei*.
- *Holstii*.
- *platypetala*.
- *Roylei*.
- *Sultani*.

INCARVILLEA. *I. Delavayi*.

- *grandiflora*.
- *variabilis*.

INDIGOFERA. *I. floribunda*: **I. Gerardiana*.

- *tinctoria.

INULA. *I. britannica*.

- *ensifolia*.
- *glandulosa*.
- *grandiflora*.
- *montana* (page 3569).
- *Oculus-Christi*.
- *Royleana*.

IOCHROMA. **I. fuchsoides*.

- *lanceolatum.

IONOPSIDIUM. *I. acaule*.IPOMÆA. *I. Batatas* (Sweet Potato).

- *Bona-nox*: *Calonyction aculeatum*; sometimes apparently applied to a strain of *I. Tuba*.
- *coccinea*: *Quamoclit coccinea*.
- *grandiflora*: probably *I. Tuba*, but perhaps sometimes applied to *I. hederacea grandiflora* or *Calonyction aculeatum*.
- *hederacea*.

IPOMÆA, continued.

- *Learii*, but the trade plant may be erroneously *I. mutabilis*.
- *limbata*: *I. hederacea limbata*.
- *mexicana*: *I. hirsutula*.
- *Nil*: *I. hederacea*.
- *noctiflora*: *Calonyction aculeatum*.
- *pandurata*.
- *paniculata*: *I. digitata*.
- *purpurea* (*Convolvulus*).
- *Quamoclit*: *Quamoclit pinnata*.
- *rubro-cærulea*: *I. tricolor*.
- *setosa*.
- *Tuba*.

IPOMOPSIS. *I. elegans*: *Gilia coronopifolia*.IRESINE (see *Achyranthes*). *I. Herb-stii*.

- *Lindenii*.

IRIS. *I. asiatica*: *I. pallida*.

- *atropurpurea*: probably *I. atropurpurea*; perhaps also applied to a color form of *I. pumila* or *I. germanica*.

- *aurea*.
- *Cengialti*.
- *cristata*.
- *cuprea*: *I. fulva*.
- *cyanea*: *I. reticulata cyanea*.
- *dalmatica*: *I. pallida dalmatica*.
- *flavescens*.
- *florentina*.
- *foetidissima*.
- *germanica*.
- *gracilipes* (page 3569).
- *graminea*.
- *Kaempferi*: *I. lævigata*.
- *lævigata*.
- *longipetala*.
- *macrantha*.
- *missouriensis*.
- *ochroleuca*: *I. orientalis*.
- *orientalis*.
- *pallida*.
- *plicata*.
- *Pseudacorus*.
- *pumila*.
- *reticulata*.
- *sibirica*.
- *spectabilis*: *I. Xiphium*.
- *stylosa*: *I. unguicularis*.
- *verna*.
- *versicolor*.
- *virginica*: *I. versicolor*.
- *Wilsonii*.
- *xiphioides*.
- *Xiphium*.

ISMENE. *I. calathina*: *Hymenocallis calathina*.ISOLEPIS. *I. gracilis*: *Scirpus cernuus*.ITEA. **I. virginica*.IXIA. *I. crateroides*: *I. speciosa*.

The *Ixia* names are difficult to identify with the botanical species; apparently *I. columellaris* and *I. maculata* and others, enter into them.

IXORA. *I. coccinea*; sometimes misapplied to *I. chinensis*.

- *Colei*: *I. coccinea*.
- *Dixiana*: *I. coccinea*.
- *Fraseri*: *I. coccinea*.
- *javanica*.

JACARANDA. *J. mimosæfolia*: **J. ovalifolia*.JACOBÆA. *J. elegans*: *Senecio elegans*.JACOBINIA. *J. coccinea*.

- *magnifica*: *J. carnea*.
- *pauciflora* (*Libonia*).

JAMESIA. **J. americana*.JASMINUM. **J. azoricum*.

- *fruticans.
- *gracillimum.
- *grandiflorum.
- *humile.
- *ligustrifolium*: **J. rigidum*.
- *nitidum.
- *nudiflorum.
- *officinale.
- *primulinum.
- *revolutum*: **J. humile*.
- *rigidum.
- *Sambac.

JUBÆA. *J. spectabilis*.JUGLANS. *J. ailanthifolia*: **J. Sieboldiana*.

- *californica.
- *cinerea.
- *cordiformis*: **J. Sieboldiana cordiformis*.
- *japonica*: the cultivated plant is probably either **J. Sieboldiana* or **J. regia*.

- *nigra.

- *præparturiens*: **J. regia fertilis*.

- *regia.

- *Sieboldiana.

- *Sieboldii*: **J. Sieboldiana*.

JUNCUS. *J. effusus*.JUNIPERUS. *J. argentea*: **J. chinensis albo-variegata*.

- *aurea*: the name is applied to both **J. communis aurea* and **J. chinensis aurea*.

- *bermudiana*: **J. barbadensis*.

- *californica.

- *canadensis*: **J. communis depressa*.

- *chinensis.

- *communis.

- *communis montana.

- *excelsa.

- *hibernica*: **J. communis hibernica*.

- *horizontalis (see *J. Sabina*, below).

- *japonica: *J. chinensis japonica* (page 3569).

- *macrocarpa.

- *monosperma.

- *nana*: **J. communis montana*.

- *neoboriensis*: **J. macrocarpa*.

- *oblonga*: **J. communis oblonga*.

- *pachyphloea.

- *Pfitzeriana*: **J. chinensis Pfitzeriana*.

- *phœnicea.

- *procumbens*: the cultivated plant is perhaps *J. chinensis Sargentii* (page 3569).

- *prostrata*: *J. horizontalis*.

- *rigida.

- *Sabina (*J. horizontalis* is sometimes cultivated under this name).

- *scopulorum.

- *sibirica*: **J. communis montana*.

- *sinensis*: **J. chinensis*.

- *squamata.

JUNIPERUS, continued.

- *stricta*: *J. *excelsa stricta*.
- *suecica*: *J. *communis suecica*.
- *tamariscifolia*: *J. *Sabina tamariscifolia*.
- **virginiana*.

JUSSIÆA. J. *longifolia*.

- KADSURA. *K. *japonica*.
- KALANCHOE. K. *flammea*.
- KALMIA. *K. *angustifolia*.
- *glauca*: *K. *polifolia*.
- **latifolia*.

KAULFUSSIA. K. *amelloides*:
Charieis *heterophylla*.

- KENNEDYA. K. *cærulea*: probably
*Hardenbergia *Comptoniana*.
- *Comptoniana*: *H. *Comptoniana*.
- *ovata*: *H. *monophylla*.

KENTIA. K. *Belmoreana*: Howea
Belmoreana.

- *Canterburyana*: Hedyscepe *Canterburyana*.
- *Forsteriana*: Howea *Forsteriana*.
- *Macarthuri*: Ptychosperma *Macarthuri*.
- *Sanderiana*.
- *Wendlandiana*: Hydriastele *Wendlandiana*.

KERRIA. *K. *japonica* (Corchorus).KNIPHOFIA (see Tritoma). K.
alooides: K. *Uvaria*.

- *corallina*.
- *foliosa*.
- *Macowanii*.
- *nobilis*: T. *Uvaria nobilis*.
- *Pfitzeri*.
- *Saundersii*.
- *sulphurea*.
- *Uvaria* (*alooides*).

KOCHIA. K. *trichophylla*.KÆLREUTERIA. *K. *paniculata*.

- LABURNUM. *L. *alpinum* (Cytisus).
- **vulgare*: L. *anagyroides* (Cytisus).
- **Watereri* (Cytisus).

LACINIARIA. L. *pumila*: Liatris
spicata montana.

- *pycnostachya*: Liatris *pycnostachya*.
- *spicata*: Liatris *spicata*.

LACHENALIA. L. *luteola*.

- *Nelsonii*.
- *pendula*.
- *quadricolor*.
- *tricolor*.

LACTUCA. L. *sativa* (Lettuce).

- LAGENARIA. L. *leucantha*.
- *vulgaris*: L. *leucantha*.

LAGERSTRÆMIA. *L. *indica*.LAGUNARIA. *L. *Patersonii*.LAGURUS. L. *ovatus*.LAMARCKIA. L. *aurea* (Chrysurus).

- LAMIUM. L. *album*; L. *maculatum*.
- *purpureum*: probably L. *maculatum* rather than the true L. *purpureum*.

LANTANA. L. *delicatissima*: proba-
bly L. *Sellowiana*.

- *hybrida*: dwarf garden forms of L.
Camara.
- *Sellowiana*.

LAPAGERIA. L. *alba*. L. *rosea*
albiflora.— *rosea*.LAPEYROUSIA. L. *cruenta* (An-
omatheca).LARIX. L. *americana*: *L. *laricina*.

- *decidua*: *L. *europæa*.
- **europæa*: L. *decidua*.
- *hybrida* (page 3569).
- *Kaempferi*: *L. *leptolepis*.
- **laricina*.
- **leptolepis*.

LASIANDRA. L. *macrantha*: Tibou-
china *semidecandra*.LASTREA. L. *dilatata*: Dryopteris
spinulosa dilatata.— *Filix-mas*: D. *Filix-mas*.LATANIA. L. *borbonica*: L. Com-
mersonii; stock usually Livi-
stona *chinensis*.LATHYRUS. L. *grandiflorus*; also ap-
plies to L. *latifolius grandiflorus*.

- *latifolius*.
- *magellanicus*.
- *niger* (Orobis).
- *odoratus*.
- *vernus* (Orobis).

LAUROCERASUS. L. *Bertinii*:
Prunus *Laurocerasus Bertinii*:

- *L. *officinalis Bertinii*.
- **caroliniana*: P. *caroliniana*.
- *caucasica*: P. *Laurocerasus cau-*
casica: *L. *officinalis caucasica*.
- *colchica*: P. *Laurocerasus colchica*:
*L. *officinalis colchica*.
- **lusitanica*: P. *lusitanica*.
- **officinalis*: P. *Laurocerasus*.
- *rotundifolia*: P. *Laurocerasus*
rotundifolia: *L. *officinalis*
rotundifolia.
- *versaillensis*: P. *Laurocerasus ver-*
saillensis: *L. *officinalis ver-*
saillensis.

LAURUS. L. *Benzoin*: *Benzoin
æstivale.

- *Cerasus*: Prunus *Laurocerasus*:
*Laurocerasus *officinalis*.
- *lusitanica*: Prunus *lusitanica*:
*Laurocerasus *lusitanica*.
- **nobilis*.

LAVANDULA. **officinalis*: L. *vera*.
*L. *Spica*.LAVATERA. L. *alba*: L. *trimestris alba*.

- *arborea*.
- *rosea*: L. *trimestris*.
- *splendens*: L. *trimestris splendens*.
- *trimestris*.

LAYIA. L. *elegans*.LEDUM. *L. *grœnlandicum*.

- *latifolium*: *L. *grœnlandicum*.
- **palustre*.

LEIOPHYLLUM (Dendrium). *L.
buxifolium.LEONOTIS. L. *Leonurus*.LEONTOPODIUM. L. *alpinum*
(Gnaphalium).LEPACHYS. L. *columnaris* (Obelis-
caria).— *pinnata*.

LEPARGYREA. See Shepherdia.

LEPIDIUM. L. *sativum* (Cress).LEPTOSIPHON. L. *androsaceus*:
Gilia *androsacea*.

- *aureus*: G. *micrantha*.
- *carmineus*: G. *micrantha*.
- *densiflorus*: G. *densiflora*.
- *hybridus*: G. *micrantha*.

LEPTOSPERMUM. L. *flexuosum*
(Agonis).— **lævigatum*.LEPTOSYNE. L. *maritima*.— *Stillmanii*.LESPEDEZA. *L. *bicolor* (Desmo-
dium).

- *japonica*: *D. *japonicum*.
- *Sieboldii*: L. *formosa*, Koehne
(L. *Sieboldii* is not tenable un-
der the rules): *D. *penduliflorum*.

LEUCÆNA. *L. *glauca*.LEUCOCRINUM. L. *montanum*.LEUCOJUM. L. *æstivum*.— *vernum*.LEUCOTHOË. *L. *Catesbæi* (An-
dromeda).— **racemosa*.— **recurva*.LEYCESTERIA. L. *elegans*: *L.
formosa.LIATRIS (Lacinaria). L. *elegans*.

- *ligulistylis*.
- *punctata*.
- *pycnostachya*.
- *scariosa*.
- *spicata*.

LIBOCEDRUS. *L. *chilensis*.— **decurrens*.LIBONIA. L. *floribunda*: Jacobinia
pauciflora.LICUALA. L. *grandis*.LIGULARIA. L. *clivorum* (Senecio).

- *Kaempferi* (Farfugium. Senecio).
- *Wilsoniana* (see Senecio, page
3153).

LIGUSTRUM. *L. *acuminatum*.

- **amurense*; but misapplied to L.
sinense.

— *chinense*: *L. *sinense*.— **coriaceum*.— **ibota*.— **japonicum*.— **lucidum*.— *macrocarpum*: *L. *acuminatum*
macrocarpum.— *macrophyllum*: *L. *lucidum*.

- *marginatum*: probably L. *vulgare*
argenteo-marginatum or *aureo-*
marginatum.

— *medium*: *L. *acuminatum*.— **nepalense*.— **ovalifolium*.— **Quihoui*.— *Regelianum*: *L. *ibota* *Regel-*
ianum.— **sinense*.

- *spicatum*: the cultivated plant
is probably L. *Massalongianum*,
L. *japonicum*, L. *lucidum* or L.
nepalense.

— **vulgare*.LILIUM. L. *auratum*.— *Batemanniae*.— *Bloomerianum*: L. *Humboldtii*.— *Bolanderi*.

LILIUM, continued.

- *Brownii*.
- *canadense*.
- *candidum*.
- *carolinianum*.
- *chalcedonicum*.
- *colchicum*: *L. monadelphum*.
- *columbianum*.
- *concolor*.
- *croceum*.
- *dauricum*.
- *elegans*.
- *excelsum*: *L. testaceum*.
- *giganteum*; applies also to *L. longiflorum giganteum*.
- *Grayi*.
- *Hansonii*.
- *Henryi*.
- *Humboldtii*.
- *japonicum*.
- *Kelloggii*.
- *Krameri*: *L. japonicum*.
- *Leichtlinii*.
- *longiflorum*.
- *maculatum*: *L. medioloides*, *L. candidum maculatum* or *L. chalcedonicum maculatum*.
- *magnificum*: *L. speciosum magnificum* or *L. Humboldtii magnificum*.
- *maritimum*.
- *Martagon*.
- *Maximowiczii*.
- *myriophyllum*: *L. regale*.
- *pardalinum*.
- *Parryi*.
- *parviflorum*.
- *parvum*.
- *philadelphicum*.
- *puberulum*: *L. Humboldtii puberulum*.
- *rubellum*.
- *rubescens*: *L. washingtonianum rubescens*.
- *Sargentiae*.
- *speciosum*; perhaps sometimes misapplied to *L. candidum speciosum*.
- *superbum*.
- *Szovitzianum*: *L. monadelphum Szovitzianum*.
- *tenuifolium*.
- *testaceum*.
- *Thomsonianum*: *L. roseum*.
- *Thunbergianum*: *L. elegans*.
- *tigrinum*.
- *umbellatum*: probably *L. dauricum*, but may be true *L. umbellatum*.
- *Wallichianum*.
- *washingtonianum*.

LIMNANTHEMUM. *L. indicum*:

- Nymphoides indicum*.
- *lacunosum*: *N. lacunosum*.
- *nymphoides*: *N. peltatum*.

LIMNANTHES. *L. Douglasii*.LIMNOCHARIS. *L. Humboldtii*:

- Hydrocleis nymphoides*.

LIMODORUM. *L. pulchellus*: *Calopogon pulchellus*.LIMONIUM. See the names under *Statice*.LINARIA. *L. alba*: perhaps *L. Cymbalaria alba* or *L. bipartita alba*.

- *bipartita*.
- *Cymbalaria*.

LINARIA, continued.

- *hepaticifolia*.
- *macedonica*.
- *maroccana*.
- *reticulata*.

LINDELOFIA. *L. longifolia*.LINDERA. *L. Benzoin*: **Benzoin æstivale*.LINOSYRIS. *L. vulgaris*.

- LINUM. *L. austriacum*.
- *coccineum*: *L. grandiflorum coccineum*.
- *flavum*.
- *grandiflorum*.
- *Lewisii*.
- *narbonneuse*.
- *perenne*.

LIPARIS. *L. liliifolia*.

- *Lœselii*.

LIPPIA. *L. citriodora* (*Aloysia. Verbena*).

- *repens*: *L. canescens*.

LIQUIDAMBAR. **L. Styraciflua*.LIRIODENDRON. **L. Tulipifera*.

- LISIANTHUS. *L. Russellianus*: probably *Eustoma Russellianum*, although true *L. Russellianus* is sometimes cultivated.

LITCHI. *L. chinensis* (*Nephelium*).

LITHOCARPUS. See page 3569.

LIVISTONA. *L. australis* (*Corypha*).

- *chinensis* (*Latania*).
- *rotundifolia*.

LOASA. *L. aurantiaca*: *Blumenbachia lateritia*.

- *tricolor*.

LOBELIA. *L. cardinalis*; stock is sometimes *L. fulgens*.

- *Erinus*.
- *gracilis*: applies to *L. gracilis* or *L. Erinus gracilis*.
- *heterophylla*; or the stock may be *L. Erinus*.
- *pumila*: *L. Erinus pumila*, not *L. pumila* of botanists.
- *ramosa*: *L. tenuior*.
- *speciosa*: *L. Erinus speciosa*, not *L. speciosa* of botanists.
- *syphilitica*.
- *tenuior*.
- *Tupa*.

LOMARIA. *L. ciliata*: *Blechnum Moorei*.LONICERA. *L. Albertii*: **L. spinosa* *Alberti* (*Chamæcerasus*).

- *albida*: **L. bella albida*.
- *aurea*: **L. Periclymenum aurea*, not *L. aurea* of botanists.
- *belgica*: **L. Periclymenum belgica*.
- **bella*.
- *brachypoda*: a form of *L. japonica*.
- **Brownii*.
- **canadensis*.
- **Caprifolium*; but the plant cultivated is perhaps sometimes *L. americana*.
- *chinensis*: **L. japonica chinensis*.
- **chrysanthia*.
- **dioica*.
- **flava*.
- *flexuosa*: **L. japonica flexuosa*.

LONICERA, continued.

- **fragrantissima*; sometimes also used for *L. Standishii*.
- *fuchsoides*: **L. Brownii fuchsoides*, not *L. fuchsoides* of botanists.
- *gigantea*: either *L. etrusca pubescens* or *L. etrusca superba*.
- *glauca*: **L. dioica*.
- *grandiflora*: **L. tatarica grandiflora*.
- *Halliana*: **L. japonica Halliana*.
- **Heckrottii*.
- **Henryi*.
- **involutrata*.
- **japonica*.
- **Ledebouri*.
- **Maackii* (*Chamæcerasus*).
- **Morrowii*.
- **muendeniensis*.
- **muscaviensis*.
- **notha*.
- **oblongifolia*.
- **Periclymenum*.
- **pileata*.
- **pyrenaica*.
- **Ruprechtiana*.
- **segreziensis*.
- **sempervirens*.
- *sinensis*: **L. Standishii*.
- **spinosa* (*Chamæcerasus*). Name sometimes applied to **L. spinosa* *Alberti*.
- **Standishii*.
- *Sullivantii*: **L. prolifera*.
- **tatarica*.
- **thibetica*.
- **trichosantha*.
- *virginalis*: **L. tatarica virginialis*.
- **Xylosteum*.

LOPHOSPERMUM. *L. scandens*: *Maurandia Lophospermum*.LOTUS. *L. Bertholetii*.

- *corniculatus*.
- *Jacobæus*.
- *peliorhynchus*: *L. Bertholetii*.

LUCUMA. *L. mammosa*.

- *nervosa*.

LUFFA. *L. acutangula* (*Cucumis*).

- *cylindrica*.

LUNARIA. *L. biennis*: *L. annua*.LUPINUS. *L. affinis*.

- *arboreus*.
- *Cruikshanksii*: *L. mutabilis Cruikshanksii*.
- *Hartwegii*.
- *hirsutus*.
- *luteus*; but also *L. arboreus luteus*.
- *mutabilis*.
- *nanus*.
- *perennis*.
- *polyphyllus*.
- *subcarnosus*.
- *tricolor*: *L. Dunnettii*.

LYCHNIS. *L. alpina*.

- *chalcedonica*.
- *Cœli-rosa* (*Agrostemma. Viscaria*).
- *Coronaria*.
- *diurna*: *L. dioica*.
- *Flos-cuculi*.
- *Flos-Jovis* (*Agrostemma*).
- *fulgens*: probably a form of *L. coronata* rather than the true *L. fulgens*.

LYCHNIS, continued.

- *grandiflora*: *L. coronata*.
- *Haageana*.
- *plenissima*: *L. Flos-cuculi plenis-*
sima.
- *Sieboldii*: *L. coronata Sieboldii*.
- *splendens*: *L. Viscaria splendens*.
- *vespertina*: *L. alba*.
- *Viscaria* (*Viscaria*).

LYCIUM. **L. barbarum*; the plants cultivated as *L. barbarum* and *L. europæum* are usually *L. halimifolium* or *L. chinense*; the true species (*L. barbarum* and *L. europæum*) are probably not grown in this country.

- *chinense*.
- *europæum*.
- *halimifolium*.

LYCOPERSICUM. *L. esculentum* (Tomato).

- *pimpinellifolium*.

LYCOPODIUM. *L. clavatum*.

- *complanatum*.
- *dendroideum*: *L. obscurum*.
- *lucidulum*.

LYCORIS. *L. squamigera* (*Amaryllis Hallii*).

LYGODIUM. *L. japonicum*.

- *palmatum*.
- *scandens*.

LYONIA. **L. ligustrina*: *Xolisma ligustrina*.

LYONOTHAMNUS. **L. floribundus*.

- LYSIMACHIA**. *L. barystachys*.
- *ciliata*: *Steironema ciliatum*.
- *clethroides*.
- *Fortunei*.
- *japonica* (page 3569).
- *Nummularia*.
- *punctata*.
- *thyrsiflora*.
- *vulgaris*.

LYTHRUM. *L. alatum*.

- *roseum*: *L. Salicaria roseum*.
- *Salicaria*.
- *virgatum*.

MAACKIA. **M. amurensis* (*Cladrastis*).

MACADAMIA. *M. ternifolia*.

MACLURA. *M. aurantiaca*: **M. pomifera*: *Toxylon pomiferum*.

MAGNOLIA. **M. acuminata*.

- *alba superba*: **M. Soulangeana alba superba*.
- *Alexandrina*: **M. Soulangeana Alexandrina*.
- *atropurpurea*: probably a form of *M. liliflora*.

- *conspicua*: *M. denudata*.
- *cordata*: **M. acuminata cordata*.
- *denudata*.
- *Fraseri*.
- *fusca*: **Michelia fuscata*.
- *glauc*.
- *gloriosa*: **M. grandiflora gloriosa*.
- *grandiflora*.
- *Halleana*: **M. stellata*.
- *hypoleuca*.
- *Kobus*.
- *Lennei*: **M. Soulangeana Lennei*.
- *liliflora*: **M. obovata*.

MAGNOLIA, continued.

- **macrophylla*.
- *Norbertiana*: **M. Soulangeana Norbertiana*.
- **obovata*: *M. liliflora*.
- **parviflora*.
- *purpurea*: *M. liliflora*: **M. obovata*.
- *rustica*: **M. Soulangeana rustica*.
- **salicifolia*; sometimes misapplied to *M. grandiflora angustifolia*.
- **Soulangeana*.
- *speciosa*: **M. Soulangeana speciosa*.
- *stellata*.
- *stricta*: **M. grandiflora exoniensis*.
- *Thompsoniana*.
- **tripetala*.
- **Watsonii*.
- *Yulan*: *M. denudata*: **M. conspicua*.

MAHONIA (*Odostemon* under American Code). **M. Aquifolium*.

- *Fortunei*.

- **japonica*.

- **nervosa*.

- *pinnata*.

- **repens*.

MAIANthemum (*Unifolium* under American Code). *M. bifolium* (*Smilacina*).

MALCOMIA. *M. maritima*.

MALOPE. *M. grandiflora*: *M. trifida grandiflora*.

- *rosea*: *M. trifida rosea*.

MALUS. **M. angustifolia*: *Pyrus angustifolia*.

- **Arnoldiana*: *Pyrus pulcherrima Arnoldiana*.

- **atrosanguinea*: *P. atrosanguinea*.

- **baccata*: *P. baccata*.

- *cerasiformis*: *P. cerasifera*: **Malus cerasifera*.

- **coronaria*: *P. coronaria*.

- *crataegifolia*: *P. florentina*: **Malus florentina*.

- **Dawsoniana*: supposed hybrid of *P. fusca* and *P. Malus* (see page 2876).

- *denticulata*: unidentified; probably *P. prunifolia* Rinki.

- **florentina*: *P. florentina*.

- **floribunda*: *P. pulcherrima*.

- **fusca*: *P. fusca*.

- **Halliana*: *P. Halliana*.

- **ioensis*: *P. ioensis*.

- *Malus*: *P. Malus*: **M. sylvestris*.

- **Niedzwetzkyana*: *P. Malus Niedzwetzkyana*.

- **Parkmanii*: *P. Halliana Parkmanii*.

- **prunifolia*: *P. prunifolia*.

- *Ringo*: *P. prunifolia* Rinki: **Malus prunifolia* Rinki.

- **Sargentii*: *P. Sargentii*.

- **Scheideckeri*: *P. pulcherrima Scheideckeri*.

- *Sieboldii*: *P. Sieboldii*: **M. Toringo*.

- **Soulardii*: *P. Soulardii*.

- **spectabilis*: *P. spectabilis*.

- **sylvestris*: *P. Malus*.

- **Toringo*: *P. Sieboldii*.

- **Zumi*: *P. Zumi*.

MALVA. *M. Alcea*.

- *crispa*.
- *miniata*: *Sphaeralcea cisplatina*.
- *moschata*.

MALVAVISCUS. *M. arboreus* (*Achania*).

MAMMEA. *M. americana*.

MANDEVILLA. **M. suaveolens*.

MANETTIA. *M. bicolor*: some of the stock is probably *M. inflata*.

MANGIFERA. *M. indica*.

MANIHOT. *M. utilissima* (*Cassava*).

MARANTA. *M. Clossonii*.

- *Goveniana*: unknown botanically.

- *illustris*: *Calathea illustris*.

- *insignis*: *C. insignis*.

- *Kerchoveana*: *M. leuconeura Kerchoveana*.

- *Makoyana*: *C. Makoyana*.

- *Massangeana*: *M. leuconeura Massangeana*.

- *rosea*: probably *C. roseo-picta*.

- *Sanderi*: probably *C. Sanderiana*.

- *Vandenheckei*: *C. Vandenheckei*.

- *vittata*: *C. vittata*.

MARRUBIUM. *M. vulgare* (*Horehound*).

MARSHALLIA. *M. trinervia*.

MARTINEZIA. *M. caryotæfolia*.

MARTYNIA. *M. Craniolaria*: *Craniolaria annua*.

- *formosa*: *M. fragrans*.

- *lutea*.

- *proboscidea*: *M. louisiana*.

MATRICARIA. *M. capensis*: *M. Chamomilla parthenoides*.

- *grandiflora*: *M. inodora plenis-*
sima, not *M. grandiflora* of botanists.

- *parthenoides*.

MATTEUCCIA. *M. Struthiopteris* (*Onoclea*).

MATTHIOLA. *M. bicornis*.

- *incana*.

MAURANDIA. *M. antirrhiniflora*: *Antirrhinum maurandioides*.

- *Barclaiana*.
- *Emeryana*: a color form of *M. Barclaiana*.

- *Lophospermum* (*Lophospermum*).

MAYTENUS. **M. Boaria*.

MECONOPSIS. *M. integrifolia*.

MEDICAGO. *M. arborea*.

- *sativa* (*Alfalfa*).

- *scutellata*.

MEDINILLA. *M. amabilis*: *M. Teysmannii*.

- *magnifica*.

MELALEUCA. *M. alba*: **M. armillaris*.

- **decussata*.

- **ericifolia*.

- **hypericifolia*.

- **incana*.

- **Leucadendron*.

- **nesophila*.

- *oppositifolia*: **M. hypericifolia*.

- **Wilsonii*.

MELIA. **M. Azedarach*.

- *umbraculifera*: **M. Azedarach umbraculiformis*.

- MELIANTHUS.** *M. major*.
MELICOCCA. *M. bijuga* (Genip).
MELILOTUS. *M. alba*.
MELISSA. *M. officinalis* (Balm).
MELOTHRIA. *M. punctata* (Pilo-
 gyne).
 — *scabra*.
MENISPERMUM. **M. canadense*.
 — *dauricum*.
MENTHA. *M. piperita*.
 — *rotundifolia*.
 — *viridis*: *M. spicata*.
MENTZELIA. *M. aurea*, Baill. (*M.*
Lindleyi not tenable under the
 rules). (*Bartonia*).
MENYANTHES. *M. trifoliata*.
MENZIESIA. **M. pilosa*.
MERATIA. **M. præcox* (*Chimonan-*
thus).
MERTENSIA. *M. ciliata*.
 — *virginica*.
MESEMBRYANTHEMUM. *M. cor-*
difolium.
 — *crystallinum*.
 — *roseum*.
 — *tricolor*: *M. pyropeum*.
MESPILUS. **M. germanica*.
METROSIDEROS. *M. floribunda*:
 **Callistemon lanceolatus*.
 — **robustus*.
 — *semperflorens*: **Callistemon lanceo-*
latus.
MICHELIA. **M. fuscata*.
MILLA. *M. biflora*.
MILLETTIA. **M. megasperma* (see
 Vol. V, page 2706).
MIMOSA. *M. pudica*.
MIMULUS. *M. cardinalis*.
 — *cupreus*.
 — *moschatus*.
 — *ringens*.
 — *Roezii*: *M. luteus alpinus*.
 — *tigrinus*: a form of *M. luteus*.
MINA. *M. lobata*: *Quamoclit lobata*.
 — *sanguinea*: *Q. coccinea hederi-*
folia.
MIRABILIS. *M. jalapa*.
 — *longiflora*.
MISCANTHUS (*Eulalia*). *M. sinen-*
sis.
MITCHELLA. *M. repens*.
MITELLA. *M. diphylla*.
MOLINIA. *M. cærulea* (*Aira*).
MOLUCELLA. *M. lævis*.
MOMORDICA. *M. Balsamina*.
 — *Charantia*.
 — *Elaterium*: *Ecballium Elaterium*.
MONARDA. *M. didyma*.
 — *fistulosa*.
 — *mollis*: *M. fistulosa mollis*.
MONSTERA. *M. deliciosa*.
MONTBRETIA. *M. auran-
 tiaca*:
Tritonia crocosmæflora auran-
tiaca.
 — *crocosmæflora*: *T. crocosmæflora*.
 — *Pottsii*: *T. Pottsii*.
 — *rosea*: *T. rosea*.
 — *speciosa*: *T. crocosmæflora*
speciosa.
- MORUS.** **M. alba*.
 — **multicaulis*.
 — **nigra*.
 — *pendula*: **M. alba pendula*.
 — **rubra*.
 — *tatarica*: **M. alba tatarica*.
MUCUNA. *M. pruriens*: *Stizolo-*
bium pruriens.
MUEHLENBECKIA. **M. complexa*.
 — *platyclada*.
MUSA. *M. Cavendishii*.
 — *Ensete*.
 — *sapientum*: *M. paradisiaca sapien-*
tum.
MUSCARI. *M. botryoides*.
MYOPORUM. **M. lætum*.
MYOSOTIS. *M. alpestris*.
 — *azorica*.
 — *dissitiflora*.
 — *elegantissima*: probably *M. dis-*
sitiflora elegantissima, but has
 also been applied to forms of *M.*
palustris and *M. sylvatica*.
 — *palustris*: *M. scorpioides*.
 — *stricta*: *M. alpestris stricta*, not
M. stricta of botanists.
 — *sylvatica*.
MYRICA. *M. asplenifolia*: **Comp-*
tonia asplenifolia.
 — *carolinensis* (**Northern Bay-*
berry).
 — *cerifera* (**Southern Wax Myrtle*).
 What was formerly considered
 to be one species and listed as
M. cerifera is now known to be
 two species. Both species range
 as far south as Florida, but the
 true *M. cerifera* extends north
 only to Maryland and southern
 New Jersey, whereas *M. carolin-*
ensis grows wild to Nova
 Scotia.
 — **Gale*.
MYRICARIA. *M. germanica* (*Tama-*
rix).
MYRIOPHYLLUM. *M. proserpina-*
coides.
MYRISTICA. *M. fragrans* (*Nutmeg*).
MYRSIPHYLLUM. *M. aspara-*
goides: *Asparagus aspara-*
goides.
MYRTUS. **M. communis*.
 — *Luma*: **Eugenia apiculata*.
 — *microphylla*: **M. communis mi-*
crophylla, not *M. microphylla* of
 botanists.
 — **Ugni*.
NANDINA. **N. domestica*.
NARCISSUS. The garden forms of
Narcissus are not usually sold
 under the names of the botanical
 species. The main species-types
 represented in the common cul-
 tures are given here.
 — *biflorus*.
 — *Bulbocodium*.
 — *incomparabilis*.
 — *Jonquilla*.
 — *orientalis*: *N. Tazetta orientalis*.
 — *ornatus*: *N. poeticus ornatus*.
 — *poetaz* (hybrid).
NARCISSUS, continued.
 — *poeticus*.
 — *Pseudo-Narcissus*.
 — *Tazetta*.
NASTURTIUM. *N. officinale*:
Roripa Nasturtium (also entered
 as *Radicula Nasturtium-aquat-*
icum).
NEGUNDO. *N. aceroides*: **Acer*
Negundo.
 — *fraxinifolium*: **A. Negundo*.
NELUMBIUM. *N. album*: *Nelumbo*
nucifera alba.
 — *kermesinum*: *Nelumbo nucifera*
kermesina.
 — *luteum*: *Nelumbo lutea*.
 — *pekinensis*: *Nelumbo nucifera*
pekinensis.
 — *roseum*: *Nelumbo nucifera rosea*.
NELUMBO. The proper form of the
 name; see above.
NEMESIA. *N. compacta*: *N. ver-*
sicolor compacta.
 — *strumosa*.
NEMOPANTHUS. *N. canadensis*:
 **N. mucronata*.
NEMOPHILA. *N. atomaria*: *N.*
Menziesii.
 — *crambeoides*: *N. Menziesii cram-*
beoides.
 — *discoidalis*: *N. Menziesii dis-*
coidalis.
 — *insignis*: *N. Menziesii insignis*.
 — *maculata*.
NEPENTHES. *N. atrosanguinea*.
 — *Courtii*.
 — *Dominiana*: probably *N. Dominii*.
 — *Henryana*.
 — *intermedia*.
 — *Mastersiana*.
 — *Patersonii*: *N. Paradisæ*.
 — *Phyllamphora*.
 — *Sedenii*.
NEPETA. *N. Cataria* (*Catnip*).
 — *Glechoma*: *N. hederacea* (*Gle-*
choma).
 — *Mussinii*.
 — *Wilsonii*.
NEPHELIUM. *N. Litchi*: *Litchi*
chinensis.
NEPHRODIIUM. *N. hirtipes*: *Dry-*
opteris hirtipes.
NEPHROLEPIS. *N. cordata*: **N.*
cordifolia.
 — *exaltata*.
 The *Nephrolepis* names are now
 many, representing mutations
 from *N. exaltata*. See *Nephro-*
lepis, page 2131; also page 3569.
NERINE. *N. sarniensis*.
NERIUM. *N. album*: probably a
 variety of *N. Oleander*.
 — *atropurpureum*: probably a va-
 riety of *N. Oleander*.
 — **Oleander*.
NEVIUSIA. **N. alabamensis*.
NICANDRA. *N. Physalodes*.
NICOTIANA. *N. affinis*: *N. alata*
grandiflora.
 — *alata*.
 — *atropurpurea*: a horticultural form
 of *N. Tabacum macrophylla*.

NICOTIANA, continued.

- *colossea*: *N. tomentosa*.
- *Sanderæ*.
- *syvestris*.
- *Tabacum* (Tobacco).
- *tomentosa*.
- NIEREMBERGIA**. *N. frutescens*.
- *gracilis*.
- *rivularis*.
- NIGELLA**. *N. damascena*.
- NIPHOBOLUS**. *N. lingua*: *Cyclophorus Lingua*.
- NOLANA**. *N. atriplicifolia*: *N. paradoxa*.
- *grandiflora*: *N. paradoxa*.
- NOLINA**. *N. Beldingii*.
- *longifolia*.
- *Parryi* (Dasylirion).
- NUPHAR**. *N. advena*.
- NYCTERINIA**. *N. capensis*: *Zaluzianskya capensis*.
- *selaginoides*: *Z. selaginoides*.
- NYMPHÆA** (Castalia). *N. alba*; sometimes applied to a white form of *N. gigantea*.
- *Bissetii*.
- *cærulea*; but may sometimes be *N. capensis*.
- *candidissima*: *N. alba candidissima*.
- *capensis*.
- *Daubeniana*.
- *Deaniana*.
- *dentata*: *N. Lotus dentata*.
- *devoniensis*.
- *flava*: *N. mexicana*.
- *flavo-virens*.
- *gigantea*.
- *Gladstoniana*.
- *gracilis*: probably *N. flavo-virens*, possibly form of *N. gigantea*.
- *kewensis*.
- *Laydeckeri*.
- *Mariacea*: a race of hybrids.
- *mexicana*.
- *odorata*.
- *ovalifolia* (page 3570).
- *pulcherrima*.
- *pygmæa*: *N. tetragona*.
- *Richardsonii*: *N. tuberosa Richardsonii*.
- *Robinsonii*.
- *rubra-rosea*.
- *Sturtevantii*.
- *tetragona*.
- *tuberosa*.
- *zanzibariensis*: *N. capensis zanzibariensis*.
- NYMPHOIDES**. *N. indicum* (Limnanthemum).
- NYSSA**. **N. aquatica*.
- *multiflora*: **N. sylvatica*.
- **sylvatica*.
- OAKESIA**. *O. sessilifolia* (Uvularia).
- OBELISCARIA**. *O. pulcherrima*: *Lepachys columnaris pulcherrima*.
- OCIMUM**. *O. Basilicum* (Basil).
- ODONTONEMA** (page 3342). *O. Schomburgkianum* (Thysa-canthus).

ODONTOSORIA. *O. chinensis* (Davallia).

- GENOTHERA**. *Æ. acaulis*.
- *biennis*.
- *bistorta*.
- *brachycarpa*.
- *cæspitosa*.
- *Drummondii*.
- *Fraseri*: *Æ. glauca Fraseri*.
- *fruticosa*.
- *glauca*.
- *Lamarckiana*.
- *macrocarpa*: *Æ. missouriensis*.
- *Pilgrimii*.
- *rosea*.
- *serrulata*.
- *speciosa*.
- *tetraptera*.
- *Whitneyi*: *Godetia grandiflora*.
- *Youngii*: *Æ. fruticosa Youngii*.
- OLEA**. **O. europæa* (Olive).
- *fragrans*: **Osmanthus fragrans*.
- OMPHALODES**. *O. linifolia* (Cynoglossum).
- ONOCLEA**. *O. sensibilis*.
- *Struthiopteris*: *Matteuccia Struthiopteris*.
- ONOPORDON**. *O. tauricum*.
- ONYCHIUM**. *O. japonicum*.
- OPHIOGLOSSUM**. *O. vulgatum*.
- OPHIOPOGON**. *O. Jaburan*.
- OPLISMENUS**. *O. hirtellus* (Panicum).
- OPULASTER** (adopted under American Code). *O. bracteatus*: **Physocarpus bracteatus*.
- *glabratus*: **P. glabratus*.
- *intermedius*: **P. intermedius*.
- *monogynus*: **P. monogynus*.
- *opulifolius*: **P. opulifolius*.
- *pubescens*: **P. malvaceus*.
- *Ramaleyi*: *P. bracteatus* or *P. intermedius*.
- OPUNTIA**. *O. arenaria*.
- *Camanchica*.
- *Ficus-indica*.
- *humilis*.
- *phæacantha*.
- *polyantha*.
- *Rafinesquii*: *O. humilis*.
- *vulgaris*.
- ORCHIS**. *O. spectabilis*: *Galeorchis spectabilis* (doubtfully separable from the genus *Orchis*; under that genus it is *O. spectabilis*).
- OREODOXA**. *O. regia* (Roystonea regia).
- ORIGANUM**. *O. Majorana* (Sweet Marjoram).
- ORNITHOGALUM**. *O. arabicum*.
- *pyramidale*: *O. narbonense pyramidale*.
- *umbellatum*.
- OROBUS**. *O. lathyroides*: *Vicia oroboides*.
- *niger*: *Lathyrus niger*.
- *vernus*: *Lathyrus vernus*.
- ORONTIUM**. *O. aquaticum*.
- ORYZA**. *O. sativa* (Rice).

OSMANTHUS. **O. Aquifolium*.

- **Delavayi*.
- **fragrans* (Olea).
- OSMUNDA**. *O. cinnamomea*.
- *Claytoniana*.
- *gracilis*; probably a form of *O. regalis*.
- *palustris*: *O. regalis*.
- *regalis*.
- OSTRYA**. *O. virginica*: **O. virginiana*.
- OTHONNA**. *O. crassifolia*.
- OUVIRANDRA**. *O. fenestralis*: *Aponogeton fenestralis*.
- OXALIS**. *O. Acetosella*.
- *alba*: a white form of either *O. lasiandra* or *O. variabilis*.
- *albiflora*: *O. variabilis*.
- *Bowiei*.
- *cernua*.
- *Deppei*.
- *lasiandra*.
- *rosea*; but *O. enneaphylla rosea* is perhaps sometimes meant.
- *tropæoloides*: *O. corniculata atropurpurea*.
- *valdiviensis*.
- *violacea*.
- OXYDENDRUM**. **O. arboreum* (Andromeda).
- PACHISTIMA**. **P. Canbyi*.
- PACHYSANDRA**. **P. terminalis*.
- PÆONIA**. *P. alba*: probably *P. decora alba*.
- *albiflora*.
- *anemonæflora*: *P. officinalis albo-plena*.
- *arborea*: *P. suffruticosa*.
- *chinensis*: *P. albiflora sinensis*.
- *edulis*: *P. albiflora*.
- *festiva*: either *P. albiflora festiva* or *P. officinalis festiva*.
- *Humei*: *P. suffruticosa Humei*.
- *lutea*.
- *Moutan*: *P. suffruticosa*.
- *officinalis*.
- *rosea*: Probably *P. suffruticosa rosea*, but possibly *P. officinalis albo-plena*.
- *rubra*: Cf. *P. suffruticosa rubro-plena*.
- *suffruticosa*.
- *tenuifolia*.
- There are many Latin names in the garden forms of *Pæonia*, as *P. amabilis*, *atorubra*, *bicolor*, *candidissima*, *chrysanthemiflora*, *Delachii*, *delicatissima*, *elegantissima*, *formosa*, *fragrantissima*, *gigantea*, *grandiflora*, *nigricans*, *papaveriflora*, *Pottsii*, *prolifera*, *pulcherrima*, *purpurea*, *rosea*, *Thorbeckii*, *triumphans*, *umbellata*, and others.
- PALAFOXIA**. *P. Hookeriana*: *Polypoteris Hookeriana*.
- PALIURUS**. **P. Spina-Christi*.
- PANAX**. *P. gracillimum*: *Dizygotheca Veitchii gracillima*.
- *monstrosum*: *Polyscias Guilfoylei monstrosum*.

PANAX continued.

- *quinquefolium* (Ginseng).
- *Victoriæ*: *Polyscias Guilloylei* Victoriz.

PANCRATIUM. *P. calathinum*: *Hy-menocallis calathina*.**PANDANUS**. *P. graminifolius*; sometimes misapplied to *P. pygmaeus*.

- *pacificus*.
- *pygmaeus*.
- *utilis*.
- *Veitchii*.

PANDOREA. **P. australis* (Tecoma).

- **jasmynoides* (Tecoma).
- **Ricasoliana* (Tecoma).

PANICUM. *P. sulcatum*.

- *variegatum*: *Oplismenus hirtellus*.

PAPAVER. *P. alpinum*.

- *bracteatum*.
- *dubium*.
- *glaucum*.
- *lævigatum*: *P. dubium lævigatum*.
- *Mursellii*: a strain of *P. somniferum*.
- *nudicaule*.
- *orientale*.
- *Parkmanii*: *P. orientale Parkmanii*.
- *pavoninum*.
- *pilosum*.
- *Rhæas*.
- *somniferum*.
- *umbrosum*: *P. Rhæas umbrosum*.

PAPYRUS. *P. antiquorum*: *Cyperus Papyrus*.**PARADISEA**. *P. Liliastrum* (Anthericum).**PARDANTHUS**. *P. chinensis*: *Belamcanda chinensis*.

- *sinensis*: *B. chinensis*.

PARITUR. *P. elatum*: *Hibiscus elatus*.

- *tiliaceum*: *H. tiliaceus*.

PARKINSONIA. **P. aculeata*.**PARNASSIA**. *P. caroliniana*.**PARTHENOCISSUS** (see *Ampelopsis*, *Cissus*, and *Vitis*). *P. Engelmannii*: *P. quinquefolia Engelmannii*.*Engelmannii*: **Ampelopsis quinquefolia Engelmannii*.*Henryana*: **A. Henryana*.*Lowii*: *P. tricuspidata Lowii*: **A. tricuspidata Lowii*.*muralis*: *P. quinquefolia muralis*: **A. quinquefolium muralis*.*quinquefolia*: **A. quinquefolia*.*Thomsonii*: **A. Thomsonii*.*tricuspidata*: **A. tricuspidata*.*Veitchii*: *P. tricuspidata Veitchii*: **A. tricuspidata Veitchii*.**PASANIA**. See *Lithocarpus*.**PASSIFLORA**. *P. alato-cærulea*.

- *cærulea*.
- *coccinea*.
- *edulis*.
- *gracilis*.
- *incarnata*.
- *laurifolia*.
- *ligularis*.
- *lutea*.
- *manicata* (Tacsonia).
- *militaris*.

PASSIFLORA, continued.

- *mollissima* (Tacsonia).
- *Pfordtii*: *P. alato-cærulea*.
- *princeps*: *P. racemosa*.
- *quadrangularis*.
- *Van Volxemii*.
- *violacea*.

PASTINACA. *P. sativa* (Parsnip).**PAULLINIA**. *P. thalictrifolia*.**PAULOWNIA**. *P. imperialis*: **P. tomentosa*.**PAVIA**. *P. flava*: **Æsculus octandra*.

- *macrostachya*: **Æ. parviflora*.
- *nana*: **Æ. Pavia humilis*.
- *rubra*: **Æ. Pavia*.

PAVONIA. *P. hastata*. (page 3570).**PELARGONIUM**. *P. acerifolium* (page 3570). (*Geranium*.)

- *domesticum*.
- *graveolens*.
- *hortorum*.
- *odoratissimum*.
- *peltatum*.
- *zonale* (*Geranium*).

PELLÆA. *P. atropurpurea*.

- *densa*.
- *viridis* (*Pteris*).

PELTANDRA. *P. virginica*: *P. undulata*.**PENNISETUM**. *P. cupreum*: a form of *P. Ruppelii*.

- *japonicum* (*Gymnothrix*).
- *latifolium* (*Gymnothrix*).
- *longistylum*: *P. villosum*.
- *macrophyllum*: *P. macrostachyum*.
- *Ruppelianum*: *P. Ruppelii*.
- *villosum*.

PENTSTEMON. *P. acuminatus*.

- *antirrhinoides*.
- *atropurpurea*: a color form of *P. campanulatus*.
- *barbatus* (*Chelone*).
- *cæruleus*: *P. angustifolius*.
- *campanulatus*.
- *centranthifolius*.
- *Cobæa*.
- *cordifolius*.
- *cyananthus*: *P. glaber cyananthus*.
- *diffusus*.
- *Digitalis*: *P. lævigatus Digitalis*.
- *glaber*.
- *gloxinioides*.
- *grandiflorus*.
- *Hartwegii*.
- *heterophyllus*.
- *hirsutus*.
- *lævigatus*.
- *Murrayanus*.
- *ovatus*.
- *pubescens*: *P. hirsutus*.
- *secundiflorus*.
- *Smallii*.
- *spectabilis*.

PEPEROMIA. *P. maculosa*.**PERESKIA**. *P. aculeata*.**PERILLA**. *P. atropurpurea*: a color form of *P. frutescens laciniata*.

- *nankinensis*: *P. frutescens nankinensis*.

PERIPLOCA. **P. græca*.**PERISTROPHE**. *P. speciosa*.**PERNETTYA**. **P. mucronata*.**PERSEA**. **P. americana* (*P. gratisima* not tenable under the rules).

- **indica*.

PERSICA. *P. alba*: *Prunus Persica alba*: **Amygdalus Persica alba*.

- *chrysanthemum*: *Pr. Persica* var.: **A. Persica chrysanthemum*.
- *rubra*: *Pr. Persica* var.: **A. Persica rubra*.
- *vulgaris*: *Pr. Persica*: **A. Persica*.

PETASITES. *P. fragrans*.**PETROSELINUM**. *P. hortense* (*Parsley*).**PETUNIA**. *P. hybrida*.**PHACELIA**. *P. campanularia*.

- *congesta*.
- *linearis* (*Eutoca*).
- *Parryi*.
- *tanacetifolia*.
- *viscida* (*Eutoca*).
- *Whitlavia* (*Whitlavia*).

PHÆDRANTHUS. *P. buccinatorius*: **Bignonia buccinatoria*.**PHALARIS**. *P. arundinacea*.**PHASEOLUS**. *P. aconitifolius*.

- *angularis*.
- *aureus*.
- *calcaratus*.
- *Caracalla*.
- *coccineus* (*P. multiflorus*).
- *lunatus*.
- *macrocarpus*: *P. lunatus macrocarpus*.
- *multiflorus*: *P. coccineus*, Linn. (*P. multiflorus* not tenable under the rules).
- *nanus*: dwarf form of *P. vulgaris*.
- *retusus*.
- *vulgaris*.

PHEGopteris. *P. Dryopteris*.

- *hexagonoptera*.
- *polypodioides*.

PHLEODENDRON. **P. amurense*.

- **sachalinense*.

PHILADELPHUS. *P. aureus*: **P. coronarius fol. aureis*.

- *Billiardii*: **P. pubescens Souvenir de Billiard*.
- *cordifolius*: **P. Lewisii*.
- **coronarius*.
- *dianthiflorus*: **P. coronarius flore pleno*.
- **Falconeri*.
- *foliis aureis*: **P. coronarius foliis aureis*.
- *Gordonianus*: **P. Lewisii*.
- **grandiflorus*: *P. coronarius grandiflorus*, *P. pubescens*, or *P. inodorus grandiflorus*.
- *hirsutus*.
- **incanus*.
- **inodorus*; but name also applied to *P. hirsutus*.
- *latifolius*: *P. pubescens*.
- **laxus*.
- **Lemoinei*.
- **Lewisii*.
- **Magdalenæ*.
- **microphyllus*.
- *nanus*: **P. coronarius nanus*.
- *nepalensis*; but perhaps sometimes *P. coronarius tomentosus*.
- *nivalis*: *P. coronarius*.

PHILADELPHUS, continued.

- pubescens; sometimes perhaps means *P. laxus*.
- *sericanthus.
- speciosissimus: **P. coronarius speciosissimus*.
- speciosus: **P. laxus*.
- *Zeyheri.

PHILLYREA. **P. angustifolia* (Filaria).

- *decora (Filaria).
- *latifolia.

PHILODENDRON. *P. giganteum*. — spectabile.PHLEBODIUM. *P. aureum* (Poly-podium.)PHEUM. *P. pratense* (Timothy).PHLOMIS. *P. tuberosa*.PHLOX. *P. amœna*.

- Arendsii.
 - carolina: *P. ovata*.
 - cuspidata: either *P. pilosa* or a form of *P. Drummondii stellaris*.
 - decussata: probably *P. paniculata*, also *P. paniculata* × *maculata*.
 - divaricata.
 - Drummondii.
 - fimbriata: a form of *P. Drummondii stellaris*.
 - glaberrima.
 - grandiflora: either a form of *P. Drummondii rotundata* or *P. subulata grandiflora*.
 - Heynholdii: a form of *P. Drummondii rotundata*.
 - hortensiaeflora: a form of *P. Drummondii rotundata*.
 - maculata.
 - ovata.
 - paniculata.
 - pilosa.
 - Stellaria; the name *stellaris* applies to forms of *P. Drummondii* and *P. subulata*.
 - subulata.
 - suffruticosa: *P. glaberrima suffruticosa*.
- Latin names are applied to garden phloxes, particularly to forms of *P. Drummondii* and of *P. paniculata* × *maculata*.

PHŒNIX. **P. canariensis*.

- *dactylifera.
- *humilis.
- leonensis: **P. reclinata*.
- *pumila.
- *reclinata.
- *Roebelenii.
- *rupicola.
- *sylvestris.
- tenuis: **P. canariensis*.
- *zeylanica.

PHORMIUM. *P. Cookianum*.

- tenax.

PHOTINIA. **P. arbutifolia* (Heteromeles).

- japonica: **Eriobotrya japonica*.
- *serrulata.
- *villosa.

PHYLLANTHUS. *P. disticha*: *P. acidus*.

- nivosus.

PHYLLITIS. *P. Scolopendrium* (Scolopendrium).

PHYLLOSTACHYS (see Bamboo).

- **P. aurea*.
- *Boryana.
- *Castillonis.
- *Henonis.
- *marliacea.
- *mitis.
- *nigra.
- *Quiloi.
- *ruscifolia.
- *Veitchii.
- *virescens.
- *viridis.

PHYLLOTÆNIUM. *P. Lindenii*: *Xanthosma Lindenii*.PHYMATODES. *P. glaucum* (Polypodium).PHYSALIS. *P. Alkekengi*.

- Franchetii.
- ixocarpa.
- peruviana.
- pubescens.

PHYSOCARPUS (Opulaster under the American Code). *P. aureus*: **P. opulifolius luteus*: *O. opulifolius luteus*.

- *bracteatus: *O. bracteatus*.
- *intermedius: *O. intermedius*.
- *monogynus: *O. monogynus*.
- *opulifolius (Spiræa): *O. opulifolius*.
- *malvaceus: *O. malvaceus*: *O. pubescens*.

PHYSOSTEGIA. *P. speciosa*: *P. virginiana speciosa*.PICEA (see Abies). *P. ajanensis*: **P. jezoensis*.

- alba: **P. canadensis*.
- *Alcockiana: *P. bicolor*; sometimes *P. jezoensis hondoensis*.
- *bicolor.
- *canadensis.
- conica: **P. excelsa conica*.
- Douglasii: *Pseudotsuga taxifolia*: **Ps. Douglasii*.
- *Engelmannii.
- *excelsa.
- *jezoensis.
- koraiensis: not known botanically.
- Kosteriana: **P. pungens Kosteri*.
- *mariana.
- *Maximowiczii.
- Morinda: **P. Smithiana*.
- nigra: **P. mariana*.
- *Omorika.
- *orientalis.
- *polita.
- *pungens.
- *rubra.
- *sitchensis.
- *Smithiana.

- *Torreyana.
- uncinata: **P. montana uncinata*.
- *virginiana.
- Watereriana: **P. sylvestris Watereri* (page 3571).

PILOGYNE. *P. suavis*: *Melothria punctata*.PIMELEA. **P. ferruginea*.PIMENTA. *P. officinalis* (Allspice)PIMPINELLA. *P. Anisum* (Anise).PINANGA (page 3571). *P. decora*. — patula.PINUS. *P. aurea*: *P. Strobus aurea*, *P. densiflora aurea* or *P. sylvestris aurea*.

PINUS, continued.

- australis: **P. palustris*.
- austriaca: **P. nigra austriaca*.
- *Banksiana.
- *canariensis.
- *Cembra.
- *contorta.
- *Coulteri.
- *densiflora.
- divaricata: **P. Banksiana*.
- *echinata.
- *edulis.
- *excelsa.
- *flexilis.
- *halepensis.
- inops: **P. virginiana*.
- *Jeffreyi.
- *koraiensis.
- *Lambertiana.
- Laricio: **P. nigra*.
- maritima: **P. Pinaster*.
- *Massoniana; applied also to *P. Thunbergii* and to *P. sinensis*.
- mitis: **P. echinata*.
- *montana.
- *monticola.
- Mughus: **P. montana Mughus*.
- *muricata.
- *Murrayana: *P. contorta latifolia*.
- *nigra.
- *palustris.
- *Parryana.
- *parviflora.
- pentaphylla: perhaps a form of *P. parviflora*.
- *Peuce.
- *Pinaster.
- *Pinea.
- *ponderosa.
- *pungens.
- *radiata.
- *resinosa.
- rigensis: **P. sylvestris rigensis*.
- *rigida.
- *Sabiniana.
- scopulorum: **P. ponderosa scopulorum*.
- *Strobus.
- *sylvestris.
- *Thunbergii.
- *Torreyana.
- uncinata: **P. montana uncinata*.
- *virginiana.
- Watereriana: **P. sylvestris Watereri* (page 3571).

PIPER. *P. nigrum* (Pepper).PIQUERIA. *P. trinervia* (Stevia).PISTACIA. **P. atlantica*.

- chinensis: **P. sinensis*.

— *Lentiscus.

— *mutica.

— *sinensis.

— *vera.

PISTIA. *P. Stratiotes*.PISUM. *P. sativum* (Pea).PITHECOCTENIUM. *P. clematid-eum*: **P. cynanchoides*.PITTOSPORUM. **P. crassifolium*.

- *eugenoides.

— *heterophyllum.

— *phillyræoides.

— *tenuifolium.

— *Tobira.

— *undulatum.

- PLATANUS.** **P. acerifolia* (this is the tree usually planted as *P. orientalis*).
 — **occidentalis*.
 — **orientalis*.
 — **racemosa*.
- PLATYCERIUM.** *P. alcorni*.
 — *Stemmaria*: *P. aethiopicum*.
 — Willenckii.
- PLATYCODON.** *P. album*: *P. grandiflorum album*.
 — *grandiflorum* (Campanula).
 — *japonicum*: *P. grandiflorum japonicum*.
 — *Mariesii*: *P. grandiflorum Mariesii*.
- PLATYSTEMON.** *P. californicus*.
- PLUMBAGO.** **P. capensis*.
 — *coccinea*: *P. rosea coccinea*.
 — *Larpenia*: *Ceratostigma plum-baginoides*.
 — *rosea*.
- PLUMERIA.** *P. acutifolia* (Frangipani).
- POA.** *P. amabilis*: *Eragrostis amabilis*.
 — *compressa*.
 — *pratensis*.
- PODOCARPUS.** **P. macrophylla*.
 — **Nagi*.
- PODOPHYLLUM.** *P. emodi*.
 — *peltatum*.
- POGONIA.** *P. ophioglossoides*.
- POINCIANA.** *P. Gilliesii*: **Casalpinia Gilliesii*.
 — **regia*.
- POINSETTIA.** **P. pulcherrima*: *Euphorbia pulcherrima*.
- POLEMONIUM.** *P. caeruleum*.
 — *grandiflorum*: *P. caeruleum himalayicum*.
 — *himalaicum*: probably *P. caeruleum himalayicum*.
 — *reptans*.
 — *Richardsonii*: *P. humile*.
- POLYGALA.** **P. brachypoda*.
 — **Dalmaisiana*.
 — *paucifolia*.
 — *Senega*.
 — **virgata*.
- POLYGONATUM.** *P. biflorum*.
 — *commutatum*.
 — *giganteum*: *P. commutatum*.
 — *multiflorum*.
- POLYGONUM.** *P. affine*.
 — *amplexicaule*.
 — **Aubertii*.
 — **baldschuanicum*.
 — *Brunonis*: *P. affine*.
 — *compactum*: *F. Sieboldii compactum*.
 — **cuspidatum*: *P. Sieboldii*.
 — **multiflorum*: probably often misapplied to *P. amplexicaule*.
 — *orientale*.
 — *sericeum*.
 — *Sieboldii*.
- POLYPODIUM.** *P. aureum*: *Phlebodium aureum*.
 — *falcatum*.
 — *glaucum*: *Phymatodes glaucum*.
 — *subauriculatum* (*Goniophlebium*).
 — *vulgare*.
- POLYPTERIS.** *P. Hookeriana* (Palafoxia).
- POLYSCIAS.** *P. Balfouriana* (Aralia).
 — *filicifolia* (Aralia).
 — *Guilfoylei* (Aralia. Panax).
- POLYSTICHUM** (see *Aspidium*). *P. acrostichoides*.
 — *aculeatum*.
 — *angulare*.
 — *Braunii*.
 — *cristatum*.
 — *munitum*.
 — *Tsusiense*.
- PONCIRUS.** *P. trifoliata*: **Citrus trifoliata*.
- PONTERIA.** *P. cordata*.
- POPULUS.** **P. acuminata*.
 — **alba*.
 — **angulata*.
 — *angustifolia*: **P. fortissima*.
 — *aurea*: **P. Van Geertii aurea*, a form of *P. serotina*.
 — **balsamifera*.
 — **Bolleana*: *P. alba pyramidalis*.
 — *canadensis*: **P. deltoides*.
 — **candicans*.
 — **canescens*.
 — *carolinensis* (**Carolina Poplar*).
P. Eugenei, *P. angulata* (Hybrid **Carolina Poplar*), and probably others; a group of hybrids in need of further study.
 — **deltoides*.
 — *Eugenei* (*Carolina P.*, in part).
 — *fastigiata*: **P. nigra italica*.
 — **fortissima*.
 — **Fremontii*.
 — *græca*: *P. grandidentata*; perhaps sometimes *P. tremuloides*.
 — **grandidentata*.
 — *italica*: **P. nigra italica*.
 — **Maximowiczii*.
 — **monilifera*: *P. deltoides monilifera*.
 — **nigra*.
 — *pyramidalis*: usually means **P. nigra italica* (Lombardy Poplar), but name likely to be used for other pyramidal forms, as *P. alba pyramidalis* and *P. tremula pyramidalis*.
 — **Sargentii*.
 — **Simonii*.
 — **tremula*.
 — **tremuloides*.
 — *suaveolens*; but the plant in cultivation is **P. Maximowiczii*.
- PORTERANTHUS** (name under American Code). *P. stipulacea*: *Gillenia stipulata*.
- PORTULACA.** *P. albiflora*: *P. grandiflora albiflora*.
 — *aurea*: *P. oleracea*.
 — *grandiflora*.
 — *oleracea* (cultivated form).
 — *Thellusonii*: *P. grandiflora Thellusonii*.
 — *Thorburnii*: *P. grandiflora Thorburnii*.
- POTENTILLA.** *P. atrosanguinea*.
 — *formosa*: *P. nepalensis*.
 — **fruticosa*.
 — *grandiflora*.
 — *MacNabiana*.
 — *O'Briana*.
- POTENTILLA**, continued.
 — *pyrenaica*.
 — *rupestris*.
 — *Russelliana*: hybrid.
 — **tridentata*.
 — *Veitchii*: **P. fruticosa Veitchii*.
- POTHOS.** *P. argyrea*: *Scindapsus pictus argyrea*.
- PRIMULA.** *P. acaulis*.
 — *Auricula*.
 — *cærulea*.
 — *cashmeriana*: *P. denticulata cashmeriana*.
 — *chinensis*: *P. sinensis*.
 — *cortusoides*.
 — *Croussei*: probably a garden form of *P. acaulis*.
 — *denticulata*.
 — *elatior*.
 — *farinosa*.
 — *fimbriata*: *P. sinensis fimbriata* or *P. obconica fimbriata*.
 — *Forbesii*.
 — *grandiflora*: applied to large-flowered forms of different species.
 — *japonica*.
 — *kewensis*.
 — *lutea*: *P. Auricula*.
 — *malacoides*.
 — *obconica*.
 — *officinalis*: *P. veris*.
 — *Polyantha*.
 — *pulverulenta*.
 — *rosea*: *P. obconica rosea* or *P. japonica rosea*.
 — *Sieboldii*.
 — *sinensis*.
 — *veris*.
 — *verticillata*.
 — *vulgaris*: *P. acaulis*.
- PRITCHARDIA.** *P. pacifica* (*Styloma pacifica*; see page 3279).
- PRUNELLA** (see *Brunella*). *P. grandiflora*.
 — *Webbiana*.
- PRUNUS** (see *Amygdalus*, *Cerasus*, and *Laurocerasus*). **P. alleghaniensis*.
 — **americana*.
 — *Amygdalus*: *P. communis*:
 — **Amygdalus communis*.
 — *angustifolia*.
 — **Armeniaca* (Apricot).
 — **avium* (Sweet Cherry).
 — **Besseyi* (Sand Cherry).
 — *caroliniana*: **Laurocerasus caroliniana*.
 — **cerasifera*.
 — **Cerasus* (Sour Cherry).
 — *communis* (Almond): **A. communis*.
 — *Davidiana*: **A. Davidiana*.
 — **demissa*.
 — **domestica* (Common Plum).
 — **fruticosa*.
 — **glandulosa* (Cherry-Almond).
 — **hortulana*.
 — **ilicifolia*.
 — *integrifolia*: **P. Lyonii*.
 — **japonica* (Cherry-Almond); also applied to *P. subhirtella pendula*, one of the Japanese flowering cherries.
 — **Lannesiana* (Japanese Flowering Cherry).

PRUNUS, continued.

- *Laurocerasus* (Laurus): **Laurocerasus officinalis*.
- *lusitanica*: **Laurocerasus lusitanica*.
- **Lyonii*.
- **Mahaleb*.
- **maritima*.
- *melanocarpa*: **P. demissa melanocarpa*.
- **Mume*.
- **Munsoniana*.
- **Myrobalana*: **P. cerasifera*.
- *nana* (Russian Dwarf Almond): **Amygdalus nana*.
- **nigra*.
- *nucipersica*: *P. Persica nucipersica* (Nectarine): **A. Persica nectarina*.
- **Padus* (Bird Cherry).
- *pendula*: applied to weeping forms of several species, but oftenest to **P. subhirtella pendula*, one of the Japanese flowering cherries.
- **pennsylvanica*.
- *Persica* (Peach): **A. Persica*.
- *Pissardii*: **P. cerasifera Pissardii*.
- *platycarpa*: *P. Persica platycarpa* (Flat Peach): **A. Persica platycarpa*.
- *Pseudo-Cerasus*: **P. serrulata*; also incorrectly used as a general name for other Japanese flowering cherries, as *P. Lannesiana*, *P. Sieboldii*, *P. yedoensis*; the true *P. Pseudo-Cerasus* is not in commerce in this country, and is tender.
- **pumila*; also applied to dwarf forms of other species.
- *Rhæzii*: **P. Cerasus Rhæzii*.
- *sachalinensis*: **P. serrulata sachalinensis*.
- **salicina* (Japanese Plum. *Prunus triflora*).
- *Sargentii*: **P. serrulata sachalinensis*.
- *semperflorens*: **P. Cerasus semperflorens*.
- **serotina*.
- **serrulata*.
- *sibirica*: **P. Armeniaca sibirica*.
- **Sieboldii* (Japanese Flowering Cherry).
- **Simonii*.
- *sinensis*: probably *P. glandulosa* and *P. japonica* (Cherry-Almonds).
- **spinosa*.
- **subhirtella* (Japanese Flowering Cherry).
- **tomentosa*.
- *triflora*: **P. salicina*.
- *triloba* (Flowering Almond). **A. triloba*.
- **virginiana* (Choke-Cherry).
- *Watsonii*: **P. angustifolia Watsonii* (Sand Plum).
- **yedoensis*.

PSEUDOLARIX. *P. Fortunei*: **P.*

Kaempferi.

QUERCUS, continued.

- *marilandica.
- *Michauxii (Basket Oak): Q. Prinus.
- montana (see Q. Prinus, below).
- *nigra.
- obtusiloba: *Q. stellata.
- *palustris.
- pannonica: *Q. conferta.
- pectinata: *Q. Robur pectinata.
- pedunculata: *Q. Robur.
- *Phellos.
- platanoides: *Q. bicolor.
- Prinus (Basket Oak); applied in the trade to the *Chestnut Oak only, which is Q. montana of the Cyclopaedia but for which others retain the name Q. Prinus and apply Q. Michauxii to the Basket Oak: *Q. Michauxii.
- *Prinus (*Chestnut Oak): Q. montana.
- pyramidalis: *Q. Robur fastigiata.
- *Robur.
- *rubra.
- sempervirens: *Q. virginiana.
- *Suber.
- tinctoria: *Q. velutina.
- *velutina.
- *virginiana.

RADICULA. R. Armoracia (Horseradish). Preferably Roripa Armoracia.

- Nasturtium-aquaticum (Water-Cress. Preferably Roripa Nasturtium).

RAJANIA. R. pleioneura.

RANUNCULUS. R. aconitifolius.

- acris.
- amplexicaulis.
- asiaticus.
- bulbosus.
- gramineus.
- repens.
- speciosus: R. bulbosus.

RAPHANUS. R. sativus (Radish).

RAPHIOLEPIS. *R. indica.

- japonica: *R. umbellata.
- ovata: *R. umbellata ovata.

REHMANNIA. R. angulata.

REINWARDTIA. R. trigyna (Linum)

RESEDA. R. odorata.

RETINOSPORA, but properly spelled Retinispora. (There is no such genus, the plants referred to it being all juvenile states of the genera Chamæcyparis and Thuja.)

The American Joint Committee has starred the names of the plants under Thuja and Chamæcyparis, but recognizes the value of retaining Retinispora as a trade name for these forms as indicated by stars in parentheses below (*). It is preferable to use Retinispora as a common name in connection with the correct starred botanical name.

- (*ericoides: *Thuja occidentalis ericoides; perhaps sometimes applied to Chamæcyparis thuyoides ericoides.
- (*filioides: *C. obtusa filicoides.

RETINOSPORA, continued.

- (*filifera: C. pisifera filifera.
 - (*leptoclada: probably the trade plant is *C. thyoides andeleysensis.
 - (*obtusa: *C. obtusa.
 - (*pisifera: *C. pisifera.
 - (*plumosa: *C. pisifera plumosa.
 - (*squarrosa: *C. pisifera squarrosa; probably applied also to Thuja orientalis decussata.
 - (*Veitchii: *C. pisifera squarrosa.
- RHAMNUS. *R. Alaternus.
- *alpina; trade plant is probably R. fallax.
 - *californica.
 - *carolina: *R. caroliniana.
 - *cathartica.
 - *crenata; name sometimes misapplied to R. dahurica.
 - *dahurica; sometimes cultivated as R. crenata.
 - *Frangula.
 - *imeretina.
 - *Purshiana.
- RHAPIS. R. fiabelliformis.
- humilis.
- RHEUM. R. Collinianum.
- palmatum.
 - Rhaponticum (Rhubarb).
- RHEXIA. R. virginica.
- RHODANTHE. R. maculata: Helipterum Manglesii maculatum.
- Manglesii: H. Manglesii.
- RHODOCHITON. R. volubile.
- RHODODENDRON. R. arborescens: *Azalea arborescens.
- *arborescens.
 - *arbutifolium.
 - calendulaceum: *A. lutea.
 - canadense: *Rhodora canadensis.
 - canescens: *A. canescens.
 - *carolinianum.
 - *catawbiense.
 - *ferrugineum.
 - *hirsutum.
 - indicum: *A. indica.
 - japonicum: *A. japonica.
 - Kaempferi: *A. Kaempferi.
 - ledifolium: *A. ledifolia.
 - luteum: *A. pontica.
 - *maximum.
 - Morteri: *A. gandavensis.
 - *myrtifolium, but also R. Kotschyi.
 - nudiflorum: *A. nudiflora.
 - obtusum amœnum: *A. amœna.
 - obtusum Hinodigiri: *A. Hinodigiri.
 - occidentale: *A. occidentalis.
 - *ponticum.
 - poukhanense yodogawa: *A. yodogawa.
 - *præcox.
 - *punctatum: R. minus.
 - racemosum.
 - roseum: R. maximum roseum.
 - sinense: *A. mollis.
 - *Smirnovii.
 - Vaseyi: *A. Vaseyi.
 - viscosum: *A. viscosa.
 - Wilsonianum: *R. latevirens (page 3571).
- RHODORA. *R. canadensis: Rhododendron canadense.

RHODOTYPOS. *R. kerrioides.

RHOPALOSTYLIS. R. Baueri (Areca).

- sapida (Areca).

RHUS. R. ailanthifolia: possibly R. ailanthoides, which is Picrasma quassioides.

- aromatica: R. canadensis.
- *canadensis.
- *copallina.
- *cotinoides: Cotinus americanus.
- *Cotinus: C. Coggygia.
- *glabra.
- Osbeckii: *R. javanica.
- *trilobata.
- *typhina.

RHYNCHOSPERMUM. R. jasminoides: *Trachelospermum jasminoides.

RIBES. *R. alpinum.

- atrosanguineum: *R. sanguineum atrorubens.
- aureum; the fragrant plant cultivated as R. aureum is *R. odoratum.
- *cereum.
- *Cynosbati.
- floridum: *R. americanum.
- *glandulosum.
- *Gordonianum.
- *inermis.
- longiflorum: *R. odoratum.
- *nigrum (Black Currant).
- *odoratum.
- *prostratum: *R. glandulosum.
- *sanguineum.
- saxosum: the plant in the trade under this name is *R. inermis.
- *vulgare (Red and White Currants).

RICHARDIA. R. æthiopica: Zantedeschia æthiopica.

- albo-maculata: Z. albo-maculata.
- Elliottiana: Z. Elliottiana.

RICINUS. R. bourboniensis: R. communis bourboniensis.

- cambogensis: R. communis cambogensis.
- communis.
- Gibsonii: R. communis Gibsonii.
- hybridus: R. communis hybridus.
- macrocarpus: R. communis macrocarpus.
- macrophyllus: R. communis macrophyllus.
- panormitanus: R. communis panormitanus.
- philippinensis: R. communis philippinensis.
- purpureus: R. communis purpureus.
- sanguineus: R. communis sanguineus.
- zanzibarensis: R. communis zanzibarensis.

The common Castor-bean plant, R. communis, gives rise to many marked forms, some of them having received Latin names.

RIVINA. R. humilis.

ROBINIA. R. Bessoniana: *R. Pseudacacia Bessoniana.

- Decaisneana: *R. Pseudacacia Decaisneana.
- *hispidia.

ROBINIA, continued.

- *inermis*: probably **R. Pseudacacia inermis* or *R. Pseudacacia umbraculifera*, but sometimes possibly used to designate *R. hispida macrophylla*.
- **Kelseyi*.
- **neo-mexicana*.
- **Pseudacacia*.
- *sempervirens*: **R. Pseudacacia sempervirens*.
- **viscosa*.

ROCHEA. *R. coccinea* (Crassula).RODGERSIA. *P. podophylla*.
— *tabularis*.ROMNEYA. **R. Coulteri*.RORIPA. *A. Armoracia* (Horse-radish. *Radicula*).
— *Nasturtium* (Water-Cress. *Nasturtium. Radicula*).ROSA. **R. arkansana*; the material cultivated under this name may be *R. heliophila*.

- **Banksiae*.
- **blanda*.
- **bracteata* (McCartney Rose).
- **canina*.
- *carolina*: **R. humilis*.
- **carolina*; the plant usually cultivated under this name is *R. palustris*.
- **cinnamomea*.
- **coriifolia*.
- *Engelmannii*: **R. acicularis Engelmannii*.
- *Fendleri*: **R. Woodsii Fendleri*.
- *ferruginea*: **R. rubrifolia*.
- **gymnocarpa*.
- **humilis*: *R. carolina*.
- **laevigata* (Cherokee Rose).
- **lucida*: *R. virginiana*.
- **macrophylla*.
- **multiflora*.
- **nitida*.
- **nutkana*.
- *palustris*: **R. carolina*.
- **polyantha*: hybrids of *R. multiflora* × *R. chinensis*.
- **rubiginosa*.
- **rubrifolia*.
- **rugosa*.
- *Sayi*: **R. acicularis Bourgeauiana*.
- **setigera*.
- **spinosissima*.
- *virginiana*: **R. lucida*.
- **Wichuraiana*.
- **Woodsii*.

ROSMARINUS. **R. officinalis*.ROYSTONEA. See *Oreodoxa*.

- RUBUS. **R. allegheniensis* (High-bush Blackberry).
- **argutus* (High-bush Blackberry).
- **canadensis*; if trade plant is a dewberry, it is probably *R. procumbens*.
- **crataegifolius*.
- **deliciosus*.
- **dumetorum*.
- **ellipticus*.
- **hispidus*.
- **idaeus*.
- **illecebrosus*.
- **laciniatus*.

RUBUS, continued.

- **leucodermis*.
- **Linkianus*.
- **neglectus*.
- **occidentalis*.
- **odoratus*.
- **palmaris*.
- **phoenicolasius*.
- **procumbens* (Eastern Dewberry).
- **rosæflorus* (this name is sometimes applied to the strawberry-raspberry, *R. illecebrosus*).
- **strigosus*.
- **trivialis* (Southern Dewberry).
- *ursinus*: **R. vitifolius*.
- *villosus*: **R. procumbens* if dewberry is meant, **R. allegheniensis* if high-bush blackberry is meant.
- **vitifolius* (Western Dewberry).

RUDBECKIA. *R. amplexicaulis*.

- *bicolor*.
- *californica*.
- *fulgida*.
- *hirta*.
- *laciniata*.
- *lanceolata*.
- *maxima*.
- *Neumannii*: *R. speciosa*.
- *nitida*.
- *purpurea*: *Echinacea purpurea*.
- *speciosa*.
- *subtomentosa*.
- *superba*: *R. bicolor superba*.
- *triloba*.

RUELLIA. *R. amoena* (Stephanophysum).RUMEX. *R. hymenosepalus*.

- *Patientia*.
- *scutatus*.

RUSCUS. **R. aculeatus*.RUSSELIA. *R. elegantissima*.RUTA. *R. graveolens* (Rue).SABAL. *S. Adansonii*: *S. glabra*.

- *Blackburniana*.
- *Ghiesbreghtii*.
- *mexicana*: *S. texana*.
- *Palmetto*.
- *texana*.
- *umbraculifera*: *S. Blackburniana*.

SABATIA. *S. campestris*.

- *chloroides*: *S. dodecandra*; but stock is probably mostly *S. Kennedyana*.

SACCHARUM. *S. officinarum* (Sugar-cane).SAGINA. *S. subulata*.

- SAGITTARIA. *S. japonica*: *S. sagittifolia flore-pleno*.
- *montevidensis*.
- **natans*: probably *S. subulata*, but possibly the true *S. natans*.
- *sinensis*: probably a form of *S. sagittifolia*, usually known as *S. chinensis*.

SAINTPAULIA. *S. ionantha*.SALISBURIA. *S. adiantifolia*:
**Ginkgo biloba*.SALIX (see, also, page 3571). **S. acutifolia*.

- **alba*; also applied to forms of *S. rubens*.
- **ambigua*.
- *americana*: **S. purpurea pendula*.

SALIX, continued.

- **amygdalina*.
- *appendiculata*: **S. grandifolia*.
- *aurita* × *phylicifolia*: **S. ludificans*.
- **babylonica* (Weeping Willow).
- *babylonica dolorosa*: **S. blanda*.
- *bicolor*: **S. phylicifolia*.
- **blanda* (Wisconsin Weeping Willow).
- *britzensis*: **S. vitellina britzensis*.
- *bullata*: **S. fragilis bullata* (page 3571).
- *caerulea*: **S. alba calva*.
- **Caprea*.
- **cinerea*.
- **cordata*.
- **daphnoides*.
- **discolor*.
- *dolorosa*: **S. blanda*.
- *bullata*: **S. incana*.
- **elegantissima* (Thurlo's Weeping Willow); probably also applied otherwise.
- **Erdingeri*.
- **fragilis* (Brittle Willow).
- **glabra*.
- *glabra filicifolia*: **S. gracilistyla*.
- *glabra tiliaefolia*: **S. gracilistyla*.
- **gracilistyla*.
- **grandifolia*.
- **hastata*.
- **hexandra*.
- *holosericea*: **S. stipularis*.
- **humilis*.
- **incana*.
- **irrorata* (Colorado Willow).
- **japonica* (Japanese Weeping Willow).
- *laurifolia*: **S. pentandra*.
- **longifolia*.
- **lucida*.
- **ludificans*.
- **myrsinifolia*.
- **myrtilloides*.
- **nigra*.
- *nigricans*: **S. myrsinifolia*.
- **pentandra*.
- **petiolaris*; but misapplied to *S. incana*.
- *Petzoldii*: **S. blanda*.
- **phylicifolia*.
- **Piperi*.
- *pontederana*: **S. sordida*.
- **purpurea*.
- **regalis* (Royal Willow): *S. alba splendens*.
- **repens*.
- *rosmarinifolia*: **S. incana*, not *S. rosmarinifolia* of botanists.
- **rubens*.
- *sacramentana*: probably a form of **S. fragilis*.
- **sericea*.
- **sesquiteria*.
- **Sieboldiana*.
- *Sieboldii*: probably **S. elegantissima*.
- **sordida*.
- **stipularis*.
- **viminalis* (Osier Willow).
- **vitellina* (Yellow Willow).

SALPIGLOSSIS. *S. azurea*: *S. sinuata azurea*.
— *grandiflora*: *S. sinuata*.
— *sinuata*.

SALVIA. *S. argentea*.

- *azurea*.
- *bicolor*; trade plant possibly *S. splendens* *bicolor* or *S. coccinea* *bicolor*.
- *coccinea*; possibly sometimes applied in the trade to *S. splendens*.
- *farinacea*.
- *globosa*.
- **Greggii*.
- *Horminum*.
- *involucrata*.
- *leucantha*.
- *officinalis* (Sage).
- *patens*.
- *Pitcheri*: *S. azurea grandiflora*.
- *pratensis*.
- *rubicunda*: *S. pratensis rubicunda*.
- *Scalaria*.
- *spelmina*: probably *S. Verbenaca*.
- *splendens*.
- *uliginosa*.
- *Verbenaca*.
- *verticillata*.
- *virgata*; but may apply also to *S. nemorosa*.

SAMBUCUS. *S. acutiloba*: **S. canadensis acutiloba*.

- *arborescens*: **S. pubens arborescens*.
- *aurea*: **S. nigra aurea* or *S. canadensis aurea*.
- **canadensis*.
- *glauca*: **S. cærulea*.
- *maxima*: **S. canadensis maxima*.
- **nigra*.
- **pubens*.
- **racemosa*.
- *tenuifolia*: **S. racemosa tenuifolia*.

SANGUINARIA. *S. canadensis*.**SANGUISORBA. *S. canadensis*.****SANSEVIERIA. *S. zeylanica*.****SANTOLINA. *S. Chamæcyparissus*.**

- *incana*: *S. Chamæcyparissus incana*.
- *maritima*: probably *Diotis candidissima*.

SANVITALIA. *S. procumbens*.**SAPIUM. **S. sebiferum*.****SAPONARIA. *S. calabrica*.**

- *caucasica*: *S. officinalis caucasica*.
- *ocymoides*.
- *officinalis*.
- *Vaccaria*.

SARRACENIA. *S. Catesbæi*.

- *Drummondii*.
- *flava*.
- *psittacina*.
- *purpurea*.
- *rubra*; but may be also *S. Drummondii rubra*.
- *variolaris*: *S. minor*.

SASSAFRAS. *S. officinale*: **S. variifolium*.**SATUREIA. *S. alpina* (Calamintha).**

- *hortensis* (Summer Savory). (Calamintha).
- *montana*.

SAURURUS. *S. cernuus*.**SAXIFRAGA. *S. aizoon*.**

- *Burseriana*.
- *cordifolia*.

SAXIFRAGA, continued.

- *Cotyledon*.
- *crassifolia*.
- *lingulata*.
- *orbicularis*: *S. crassifolia orbicularis*.
- *peltata*.
- *pyramidalis*: *S. Cotyledon pyramidalis*.
- *sarmentosa*.
- *speciosa*: a confused name; it may be *S. ligulata speciosa*, *S. Burseriana speciosa*, *S. sancta speciosa*, or *S. oppositifolia speciosa*; most probably *S. Burseriana speciosa*.
- *squarrosa*.
- *umbrosa*.
- *Van Houttei*: a variation of *S. crassifolia*.
- *virginensis*.

SCABIOSA. *S. atropurpurea*.

- *candidissima*: *S. atropurpurea candidissima*.
- *caucasica*.
- *japonica*.
- *maxima*: *S. atropurpurea grandiflora*.
- *minor*: *S. atropurpurea nana*.
- *ochroleuca*.

SCHINUS. **S. Molle*.

- **terebinthifolius*.

SCHIZANTHUS. *S. Grahamii*.

- *grandiflorus*: *S. pinnatus*.
- *hybridus*: not placed botanically.
- *papilionaceus*: *S. pinnatus papilionaceus*.
- *pinnatus*.
- *retusus*.
- *wisetonensis*.

SCHIZOPETALON. *S. Walkeri*.**SCHIZOPHRAGMA. **S. hydrangeoides*; but the plant in cultivation very often is *Hydrangea petiolaris*.**

- **integrifolium*.

SCHIZOSTYLIS. *S. coccinea*.**SCHLUMBERGERA. *S. Russelliana* (Epiphyllum).****SCIADOPITYS. **S. verticillata*.****SCILLA. *S. bifolia*.**

- *campanulata*: *S. hispanica*.
- *maritima*: *Urginea Scilla*.
- *nulans*: *S. nonscripta*.
- *peruviana*.
- *sibirica*.

SCINDAPSUS. *S. pictus argyræus* (Pothos).**SCIRPUS. *S. atrovirens*.**

- *cernuus* (Isoplepis).
- *Tabernæmontanus*; a form of *S. lacustris*.

SCOLOPENDRIUM. *S. officinarum*.

- *Phyllitis Scolopendrium*.
- *vulgare*: *P. Scolopendrium*.

SCOLYMUS. *S. hispanicus*.**SCORZONERA. *S. hispanica*.****SCUTELLARIA. *S. baicalensis*.**

- *cælestina*: *S. baicalensis cælestina*.

SEAFORTHIA. *S. elegans*: Archontophoenix Alexandræ and A. Cunninghamii (see Seaforthia, page 3123).**SECHIUM. *S. edule* (Chayota).****SEDUM. *S. acre*.**

- *Aizoon*.
- *alboroseum*.
- *album*; but in some cases possibly *S. acre album*, *S. brevifolium album* or *S. spectabile album*.
- *Anacampseros*.
- *atropurpureum*: *S. maximum hamatodes* or *S. spectabile atropurpureum*.
- *brevifolium*.
- *cæruleum*.
- *carneum*: *S. sarmentosum carneum*.
- *cruciatum*: *S. monregalense*.
- *dasyphyllum*.
- *Ewersii*.

- *glaucum*: may apply to *S. reflexum albescent*, *S. dasyphyllum*, *S. hispanicum* or *S. lyidium glaucum*.

— *hispanicum*.

- *hybridum*; but may be *S. Middendorffianum hybridum* or *S. Telephium hybridum*.

- *japonicum*; but material is mostly *S. alboroseum*.

— *kamtschaticum*.**— *lyidium*.****— *Maximowiczii*.****— *maximum*.****— *Middendorffianum*.****— *monregalense*.****— *oppositifolium*.**

- *pallidum*: probably *S. hispanicum*, but may be true *S. pallidum*.

— *populifolium*.

- *pulchellum*; but may apply to *S. sexangulare*.

— *reflexum*.**— *sarmentosum*.****— *sempervivoides*.****— *sexangulare*.****— *Sieboldii*.**

- *speciosum*: unknown botanically.

— *spectabile*.

- *spurium*: *S. stoloniferum*.

— *Stahlii*.**— *stoloniferum*.****— *telephoides*.****— *Telephium*.**

- *turkestanicum*: *S. Ewersii turkestanicum*.

SELAGINELLA. *S. amana*: *S. caulescens*.**— *apus*.**

- *cæsia*: *S. uncinata*.

— *cuspidata*.**— *Emmeliana*.****— *flabellata*.****— *Kraussiana*.****— *Martensii*.****— *rupestris*.****SELENICEREUS. *S. pteranthus* (Cereus nycticalus).****SEMPERVIVUM. *S. acuminatum*:****— *S. glaucum*.****— *arachnoideum*.****— *arenarium*.**

- *cornutum*: *S. hirtum*.

— *fimbriatum*.**— *globiferum*.****— *Mettenianum*.**

SEMPERVIVUM, continued.

- *pyrenaicum*; but perhaps *S. tectorum pyrenaicum*.
- *soboliferum*; this name is commonly used for *S. globiferum*.
- *tectorum*.
- *violaceum*; probably *S. tectorum violaceum*.
- SENECIO. *S. Cineraria*.
- *clivorum*: *Ligularia clivorum*.
- *cruentus* (*Cineraria*).
- *elegans* (*Jacobæa*).
- *Kaempferi*: *L. Kaempferi*.
- *mikanioides* (*German Ivy*).
- *pulcher*.
- *scandens*; some of the stock is perhaps *S. mikanioides*.
- *tanguticus*.
- *Wilsonianus*: *L. Wilsoniana*.

SEQUOIA (*Wellingtonia*). **S. gigantea*.

— **sempervirens*.

SERENOA. **S. serrulata*.

SETARIA. *S. italica* (*Millet*).

SHEPHERDIA. (*Lepargyrea* in *American Code*). **S. argentea*.

SHORTIA. *S. californica*: *Actinolepis coronaria*.

— **galacifolia*.

SICANA. *S. odorifera*.

SIDALCEA. *S. candida*.

— *malvæflora*.

SILENE. *S. acaulis*.

— *alpestris*.

— *Armeria*.

— *maritima*.

— *orientalis*.

— *pendula*.

— *pennsylvanica*.

— *Saxifraga*.

— *Schafta*.

— *virginica*.

SILPHIUM. *S. laciniatum*.

— *perfoliatum*.

SINAPIS. See *Brassica*.

SINNINGIA. *S. speciosa* (*Gloxinia* of florists).

SISYRINCHIUM. *S. bermudianum*: *S. angustifolium*.

SITOLOBIUM. *S. cicutarium*: *Dennstædia cicutaria*.

SKIMMIA. **S. japonica*.

SMILACINA (*Vagnera* in *American Code*). **S. bifolia*: *Maianthemum bifolium*.

— *racemosa*.

SMILAX. **S. hispida*.

SMILAX of florists: See *Asparagus*.

SOJA. See *Glycine*.

SOLANUM. *S. Capsicastrum*.

— **Dulcamara* (*Bitter-Sweet*).

— *giganteum*. (page 3573).

— **Hendersonii*.

— *integrifolium*.

— **jasminoides*.

— *Melongena* (*Eggplant*).

— *Melvinii*: *S. Capsicastrum Melvinii*.

— *muricatum* (*Pepino*).

— *nigrum*.

SOLANUM, continued.

- **Pseudo-Capsicum* (*Jerusalem Cherry*).
- **Rantonettii*.
- **Seafortianum*.
- *tuberosum* (*Potato*).
- *Warszewiczii*.
- **Wendlandii*.

SOLIDAGO. *S. cæsia*.

— *canadensis*.

— *nemoralis*.

— *odora*.

— *spectabilis*.

— *Virgaurea*.

Many native species of *Solidago* may appear in the lists, for which consult the current manuals of botany.

SOLLYA. **S. heterophylla*.

SOPHORA. **S. japonica*.

— **tetraptera*.

SORBARIA (mostly sold as *Spiræa*). **S. Aitchisonii*.

— **arborea*.

— **Lindleyana*.

— **sorbifolia*.

SORBUS (often named under *Pyrus*). **S. americana* (*American Mountain-Ash*).

— **Aria*.

— **Aucuparia* (*European Mountain Ash*).

— **domestica*.

— *hybrida*: **S. quercifolia*.

SPARAXIS. *S. grandiflora* (usually not sold under the species-name).

SPARTIUM. **S. junceum*.

— *scoparium*: **Cytisus scoparius*.

SPECULARIA. *S. Speculum* (*Campanula*).

SPERGULA. *S. sativa* (*Spurry*).

SPHERALCEA. *S. cisplatina* (*Malva miniata*).

SPHENOGYNE. *S. speciosa*: *Ursinia pulchra*.

SPIGELIA. *S. marilandica*.

SPINACIA. *S. oleracea* (*Spinach*).

SPIRÆA. *S. Aitchisonii*: **Sorbaria Aitchisonii*.

— **alba*; an American plant usually catalogued as *S. salicifolia*, which is Asiatic.

— *argentea*: **S. canescens*.

— **arguta*.

— *ariæfolia*: **Holodiscus discolor ariæfolius*.

— *Aruncus*: *Aruncus sylvester*.

— *Astilbe* (see *Astilbe*).

— *astilboides*: *Astilbe astilboides*.

— **Billiardii*.

— *bracteata*: **S. nipponica*.

— **Bumalda*.

— **callosa*: *S. japonica*.

— *canescens*.

— *cantonensis*: **S. Reevesiana*.

— *carpinifolia*: **S. latifolia*.

— **chinensis*.

— *Davidii*: *Astilbe Davidii*.

— **Douglasii*.

— *Filipendula*: *Filipendula hexapetala*.

SPIRÆA, continued.

- *floribunda*: probably *Astilbe astilboides floribunda*.
- **Fortunei*: *S. japonica Fortunei*.
- **Proebelii*: *S. Bumalda Froebelii*.
- *gigantea*: *Filipendula camtschatica*.
- **Henryi*.
- *Humboldtii*: *Aruncus sylvester*.
- **japonica*; often misapplied to *Astilbe japonica*.
- *kamtschatica*: *Filipendula camtschatica*.
- *Kneiffii*: *Aruncus sylvester Kneiffii*.
- **latifolia*; an American plant usually catalogued as *S. salicifolia*, which is Asiatic.
- *Lindleyana*: **Sorbaria Lindleyana*.
- *lobata*: *Filipendula rubra*.
- **Margaritæ*.
- **multiflora*.
- *nipponica*.
- *opulifolia*: *Physocarpus opulifolius*: **Opulaster opulifolius*.
- *palmata*: *Filipendula purpurea*.
- **prunifolia*.
- **pyramidata*.
- **Reevesiana*: *S. cantoniensis*.
- **Rosthornii*.
- *rotundifolia*: **S. nipponica rotundifolia*.
- *salicifolia*; an Asiatic plant; name often misapplied to **S. alba* and **S. latifolia*.
- **sempervirens*.
- *sorbifolia*: **Sorbaria sorbifolia*.
- *Thunbergii*.
- **tomentosa*.
- **trilobata*.
- *Ulmaria*: *Filipendula Ulmaria*.
- **Vanhouttei*.
- *venusta*: *Filipendula rubra venusta*.
- SPIRANTHES. *S. cernua*.
- SPONDIAS. *S. axillaris*: *S. lutea*.
- SPREKELIA. *S. formosissima* (*Amaryllis*).
- STACHYS. *S. Betonica* (*Betonica*): *S. officinalis*.
- *grandiflora* (*Betonica*).
- *lanata*.
- *Sieboldii*.
- STAPHYLEA. **S. Bumalda*.
- **colchica*.
- **pinnata*.
- **trifolia*.
- STATICE (see *Armeria*). *S. arborescens*: *Limonium arborescens*.
- *Bonduellii*: *L. Bonduellii*.
- *Gmelinii*: *L. Gmelinii*.
- *incana*: *L. tataricum angustifolium*.
- *latifolia*: *L. latifolium*.
- *sinuata*: *L. sinuatum*.
- *Suworowii*: *L. Suworowii*.
- *tatarica*: *L. tataricum*.
- STEIRONEMA. *S. ciliatum* (*Lysimachia*).
- STELLARIA. *S. Holostea*.
- STENACTIS. *S. speciosa*: *Erigeron speciosus*.
- STENANTHIUM. *S. robustum*.
- STENOTAPHRUM. *S. glabrum*: *S. secundatum*.

- STEPHANANDRA. **S. flexuosa*: *S. incisa*.
- STEPHANOPHYSUM. *S. longifolium*: *Ruellia amœna*.
- STEPHANOTIS. **S. floribunda*.
- STERCULIA. **S. acerifolia*.
—**diversifolia*.
—**platanifolia*.
- STERNBERGIA. *S. lutea* (*Amaryllis*).
- STEVENSONIA. *S. grandiflora*: *S. grandifolia*.
- STEVIA. *S. serrata* of florists: *Piqueria trinervia*.
- STEWARTIA (Stuartia). **S. pentagyna*.
—**Pseudo-Camellia*.
- STIGMAPHYLLON. *S. ciliatum*.
- STIPA. *S. elegantissima*.
— *pennata*.
- STIZOLOBIUM. *S. Deeringianum* (*Velvet Bean*).
— *pruriens* (*Mucuna*).
- STOKESIA. *S. cyanea*: *S. lævis*.
- STRELITZIA. *S. Reginae*.
- STREPTOPUS. *S. roseus*.
- STREPTOSOLEN. *S. Jamesonii* (*Browallia*).
- STROBILANTHES. *S. Dyerianus*.
- STUARTIA. *S. plantaginea*: **Stewartia*
pentagyna.
— *Pseudo-Camellia*: **Stewartia*
Pseudo-Camellia.
- STYLOMA. See *Pritchardia*.
- STYLOPHORUM. *S. diphyllum*.
- STYRAX. **S. americana*.
—**japonica*.
—**Obassia*.
- SUTHERLANDIA. **S. frutescens*.
- SWAINSONA. *S. galegifolia*.
— *grandiflora*: *S. Greyana*, perhaps applied also to forms of *S. galegifolia*.
— *Greyana*.
- SYMPHORICARPOS. **S. occidentalis*.
—**oreophilus*.
—**pauciflorus*: *S. albus pauciflorus*, but the plant in cultivation is usually *S. albus*.
—**racemosus*: *S. albus*, but the plant in cultivation is usually *S. albus lævigatus*.
—**vulgaris*: *S. orbiculatus*.
- SYMPHYTUM. *S. asperrimum*: *S. asperum*.
— *officinale*.
- SYMPLOCARPUS (*Spathyema* in the American Code). *S. fœtidus*.
- SYNDESMON. See *Anemonella*.
- SYRINGA. *S. alba*: *S. vulgaris alba*.
— *cærulea*: *S. vulgaris cærulea*.
—**chinensis*.
—**japonica*.
—**Josikæa*.
—**pekinensis*.
—**persica*.
—**pubescens*.
—**rothomagensis*: *S. chinensis*.
- SYRINGA, continued.
—**villosa*.
—**vulgaris*.
—**Wilsonii*.
- SYZYGIIUM (see *Eugenia*). **S. operculatum*.
- TACSONIA. *T. manicata*: *Passiflora manicata*.
— *mollissima*: *P. mollissima*.
- TAGETES. *T. erecta*.
— *lucida*.
— *patula*.
— *signata*.
- TAMARINDUS. **T. indica*.
- TAMARIX. *T. æstivalis*: **T. pentandra*.
—**africana*; but stock usually *T. gallica* or *T. parviflora*.
— *algerica*: not known botanically; possibly a form of *T. gallica*.
— *amurensis*: a form of *T. pentandra*.
—**chinensis*.
—**gallica*.
— *germanica*: *Myricaria germanica*.
—**hispidia*.
— *indica*: **T. gallica indica*.
— *japonica*: **T. juniperina*.
—**juniperina*.
—**odessana*.
—**parviflora*.
— *pentandra*.
— *plumosa*: **T. juniperina*.
—**tetrandra*.
- TANACETUM. *T. vulgare*.
- TARAXACUM. *T. officinale* (*Dandelion*).
- TAXODIUM. **T. distichum*.
—**mucronatum*.
- TAXUS. **T. baccata*.
—**canadensis*.
—**cuspidata*.
— *hibernica*: **T. baccata fastigiata*.
— *koraiensis*: probably **Cephalotaxus Harringtonia fastigiata*.
— *minor*: **T. canadensis*.
— *procumbens*: **T. baccata procumbens*.
— *repanda*: **T. baccata repandens*.
— *repandens*: **T. baccata repandens*.
— *tardiva*: **T. baccata adpressa*.
- TECOMA. *T. australis*: **Pandorea australis*.
— *capensis*: **Tecomaria capensis*.
— *capreolata*: **Bignonia capreolata*.
— *grandiflora*: *Campsis chinensis*: **Bignonia grandiflora*.
— *jasminoides*: **Pandorea jasminoides*.
— *Mackenzii*: **Pandorea Ricasoliana*.
— *radicans*: *Campsis radicans*: **Bignonia radicans*.
— *Ricasoliana*: **Pandorea Ricasoliana*.
—**Smithii*.
—**stans*.
- TECOMARIA. **T. capensis* (*Tecoma*).
- TELANTHERA (*Alternanthera*). *T. amœna rosea*.
— *Betzickiana*.
— *versicolor*.
- TELEKIA. *T. cordifolia*: *Buphthalmum speciosum*.
- TEMPLETONIA. **T. retusa*.
- TERMINALIA. *T. Catappa*.
- TETRAGONIA. *T. expansa* (*New Zealand Spinach*).
- TETRAPANAX. **T. papyrifera* (*Aralia*, *Fatsia*).
- TEUCRIUM. *T. canadense*.
—**Chamædrys*.
- THALIA. *T. dealbata*.
- THALICTRUM. *T. adiantifolium*: *T. minus adiantifolium*.
— *anemonoides*: *Anemonella thalictroides* (page 3296, under *Syn-desmon*).
— *aquilegifolium*.
— *Cornuti*: either *T. aquilegifolium* or *T. polygamum*.
— *dasy carpum*.
— *dioicum*.
— *dipterocarpum*.
— *glaucum*.
— *minus*.
— *paniculatum*.
— *polygamum*.
- THEA. *T. Bohea*: **T. sinensis Bohea* (*Camellia*).
—**sinensis*.
- THELESPERMA. *T. hybridum* (*Cosmidium*).
- THEOBROMA. *T. Cacao*.
- THERMOPSIS. *T. caroliniana*.
- THESPIA. *T. populnea*.
- THEVETIA. *T. nereifolia*.
- THRINAX. *T. Morrisii*.
— *parviflora*.
- THUJA (*Thuya*. See *Biota*). *T. elegantissima*: **T. orientalis elegantissima*; perhaps also *T. occidentalis lutea*.
— *Ellwangeriana*: **T. occidentalis Ellwangeriana*.
— *ericoides*: **T. occidentalis ericoides*.
— *filiformis*: **T. orientalis pendula*; the stock is perhaps sometimes **T. occidentalis filiformis*.
— *gigantea*: **T. plicata*.
— *globosa*: **T. occidentalis globosa*.
— *japonica*: **T. Standishii*.
— *Lobbii*: **T. plicata*.
—**occidentalis*.
—**orientalis*.
—**plicata*.
— *pumila*: **T. occidentalis pumila*.
— *pyramidalis*: applied both to **T. occidentalis pyramidalis* and to **T. orientalis pyramidalis*.
— *Reidii*: **T. occidentalis Reidii*.
— *sibirica*: **T. occidentalis Wareana*.
—**Standishii* (*Thujaopsis*).
— *Vervœneana*: **T. occidentalis Vervœneana*.
— *Wareana*: **T. occidentalis Wareana*.
- THUJOPSIS. *T. borealis*: **Chamæcyparis nootkatensis*.
—**dolabrata*.
— *Standishii*: **Thuja Standishii*.
- THUNBERGIA. **T. alata*.
—**coccinea*.
—**fragrans*.
—**grandiflora*.
— *Harrisii*: **T. laurifolia*.

- THYMUS.** *T. citriodorus*: *T. Serpyllum* vulgaris.
 — *coccineus*: *T. Serpyllum coccineus*.
 — *lanuginosus*: *T. Serpyllum lanuginosus*.
 — *Serpyllum*.
 — *vulgaris*.
THYRSACANTHUS. *T. rutilans*: *Odontonema Schomburgkianum*.
TIARELLA. *T. cordifolia*.
 — *purpurea*: *T. cordifolia purpurea*.
TIBOUCHINA. *T. semidecandra* (*Lasiandra macrantha*).
TIGRIDIA. *T. canariensis*: *T. Pavonia canariensis*.
 — *conchiflora*: *T. Pavonia conchiflora*.
 — *grandiflora*: *T. Pavonia grandiflora*.
 — *immaculata*: *T. Pavonia alba immaculata* or *lutea immaculata*.
 — *lilacea*: *T. Pavonia lilacea*.
 — *Pavonia*.
 — *rosea*: *T. Pavonia rosea*.
TILIA. *T. alba*: a confused name applying to forms of *T. tomentosa*, *T. petiolaris*, and *T. neglecta*.
 — **americana*.
 — *argentea*: **T. tomentosa*.
 — *asplenifolia*: **T. platyphyllos laciniata*.
 — **cordata*.
 — *dasystylus*: **T. euchlora*.
 — **euchlora*.
 — *europaea*: **T. vulgaris*; sometimes misapplied to *T. platyphyllos* and *T. cordata*.
 — **heterophylla*.
 — *macrophylla*: **T. americana macrophylla*.
 — *mississippiensis*: **T. americana macrophylla*.
 — **petiolaris*.
 — **platyphyllos*.
 — **tomentosa*.
 — *ulmifolia*: **T. cordata*.
 — **vulgaris*.
TILLANDSIA. *T. usneoides* (Spanish Moss).
TIPUANA. *T. speciosa*.
TORENIA. *T. Baillonii*: *T. flava*.
 — Fournieri.
TORREYA (Tumion under American Code). **T. californica*.
 — **nucifera*.
TOXYLON. See *Maclura*.
TRACHELIUM. *T. cæruleum*.
TRACHELOSPERMUM. *T. jasminoides* (*Rhynchospermum*).
TRACHYCARPUS. **T. excelsa* (*Chamærops*).
 — **Fortunei* (*Chamærops*).
 — **Martiana*.
TRACHYMENE. *T. cærulea* (*Didiscus*).
TRADESCANTIA. *T. multicolor*: *Zebrina pendula quadricolor*.
 — *repens*: *T. fluminensis*.
 — *virginica*: *T. virginiana*.
 — *vulgaris*: unknown botanically.
 — *zebrina*: *Zebrina pendula*.
TRAGOPOGON. *T. porrifolius* (Sal-sify).
TRAPA. *T. natans*.
TRICHOLÆNA. *T. rosea*.
TRICHOSANTHES. *T. colubrina*: *T. Anguina*.
TRICYRTIS. *T. macropoda*.
 — *hirta*.
TRIFOLIUM. *T. hybridum* (Alsike Clover).
 — *incarnatum* (Crimson Clover).
 — *medium* (Mammoth Clover).
 — *minus*: a form of *T. repens* (White Clover).
 — *pratense* (Common Red Clover).
 — *suaveolens*: *T. resupinatum*.
TRILLIUM. *T. cernuum*.
 — *erectum*.
 — *erythrocarpum*: *T. undulatum*.
 — *grandiflorum*.
 — *nivale*.
 — *ovatum*.
 — *petiolatum*.
 — *recurvatum*.
 — *sessile*.
 — *stylosum*.
 — *undulatum*.
TRISTANIA. *T. conferta*.
TRITICUM. *T. æstivum* (Wheat).
TRITOMA. *T. corallina*.
 — *hybrida*: *Kniphofia hybrida*, a collective trade name.
 — *Macowanii*: *K. Macowanii*.
 — *nobilis*: *K. Uvaria nobilis*.
 — *Pfitzeri*: *K. Uvaria grandis*.
 — *Quartiniana*: *K. foliosa*.
 — *Saundersii*: *K. Uvaria Saundersii*.
 — *sulphurea*: *K. sulphurea*.
 — *tricolor*: *K. tricolor*.
 — *Uvaria*: *K. Uvaria*.
TRITONIA (*Montbretia*). *T. aurantiaca*.
 — *crocosmæflora*.
 — *Pottsii*.
 — *rosea*.
TROLLIUS. *T. asiaticus*.
 — *caucasicus*.
 — *chinensis*.
 — *europæus*.
 — *japonicus*.
 — *Ledebouri*.
 — *pumilus*.
TROPÆOLUM. *T. atropurpureum*: probably a color form of *T. peltophorum*, of *T. majus*, or of *T. majus nanum*.
 — *cunariense*: *T. peregrinum*.
 — *Heinemannii*: a color form of *T. majus*.
 — *hemisphericum*: a color form of *T. majus*.
 — *Lobbianum*: *T. peltophorum*.
 — *luteum*: a color form of *T. minus* or of *T. majus*.
 — *majus*.
 — *minus*.
 — *nanum*: *T. majus nanum*.
 — *pentaphyllum*.
 — *peregrinum*.
 — *Regelianum*: a color form of *T. majus* or of *T. majus nanum*.
 — *speciosum*.
 — *tricolor*.
TSUGA. **T. canadensis*.
 — **caroliniana*.
 — **diversifolia*.
 — *Fretzii*: *Pseudotsuga taxifolia Fretzii*: **P. Douglasii Fretzii*.
 — **heterophylla*.
 — *Hookeriana*: **T. Mertensiana*.
 — **Mertensiana*; but sometimes misapplied to *T. heterophylla*.
 — **Sieboldii*.
TULIPA. *T. Gesneriana*.
 — *suaveolens*.
TUMION. See *Torreya*.
TUNICA (*Petrorhagia* under American Code). *T. Saxifraga*.
TUSSILAGO. *T. Farfara*.
TYPHA. *T. latifolia*.
ULEX. **U. europæus*.
ULMARIA. *U. Filipendula*: *Filipendula hexapetala*.
 — *palmata*: *F. palmata*.
 — *purpurea*: *F. purpurea*.
 — *rubra*: *F. rubra*.
 — *venusta*: *F. rubra venusta*.
ULMUS. **U. alata*.
 — **americana*.
 — *Camperdownii*: **U. glabra Camperdownii*.
 — **campestris* (English Elm); often misapplied to *U. foliacea*.
 — *Clemmeri*: **U. hollandica Clemmeri*.
 — **foliacea*.
 — **fulva*.
 — **glabra* (Scotch Elm).
 — **hollandica*.
 — *horizontalis*: **U. glabra pendula*.
 — *Huntingdonii*: **U. hollandica vegeta* (*Huntingdon Elm*).
 — *latifolia*: **U. hollandica belgica*.
 — *montana*: **U. glabra*.
 — *plumosa*: **U. glabra fastigiata*.
 — **pumila*.
 — *purpurea*: **U. campestris purpurea*.
 — **racemosa*.
 — *scabra*: **U. glabra*.
 — *suberosa*: either *U. campestris* or *U. foliacea suberosa*.
 — *umbraculifera*: **U. foliacea umbraculifera*.
 — *vegeta*: **U. hollandica vegeta*.
 — *Wentworthii*: **U. campestris Wentworthii*.
UMBELLULARIA. **U. californica*.
UNIOLA. *U. latifolia*.
URGINEA. *U. Scilla* (*Scilla maritima*).
URSINIA. *U. pulchra* (*Sphenogyne*).
UVULARIA. *U. grandiflora*.
 — *perfoliata*.
 — *sessilifolia*: *Oakesia sessilifolia*.
VACCINIUM. **V. corymbosum*.
 — **erythrocarpum*.
 — **macrocarpon*.
 — **pallidum*.
 — **pennsylvanicum*.
 — **stamineum*.
 — **vacillans*.
 — **Vitis-Idæa*.

VALERIANA. *V. alba*: probably a white form of *Centranthus ruber*, but perhaps *V. officinalis alba*.

— *coccinea*: unknown botanically.

— *officinalis*.

— *rubra*: *Centranthus ruber*.

VALERIANELLA. *V. olitoria* (Corn Salad).

VALLISNERIA. *V. spiralis*.

VALLOTA. *V. purpurea*.

VENIDIO. *V. calendulaceum*: *V. decurrens calendulaceum*.

VERATRUM. *V. viride*.

VERBASCUM. *V. nigrum*.

— *olympicum*.

— *pannosum*: *V. longifolium pannosum*.

— *phoeniceum*.

VERBENA. *V. Aubletia*: *V. canadensis*.

— *citriodora*: *Lippia citriodora*.

— *erinoides*.

— *hybrida*.

— *montana*: either *V. bipinnatifida* or *V. canadensis*.

— *teucrioides*.

— *venosa*.

There are other Latin names in *Verbena*, designating garden forms.

VERNONIA. *V. arkansana*: *V. crinita*.

— *noveboracensis*.

VERONICA. **V. Allionii*.

— *alpina*.

— *amethystina*: **V. spuria*.

— *Andersonii*.

— *carnea*; but may apply to a form of *V. spuria*.

— *decussata*: **V. elliptica*.

— *elliptica*.

— *gentianoides*.

— *imperialis*.

— *incana*.

— *longifolia*.

— *maritima*: **V. longifolia*.

— *pectinata*.

— *repens*.

— *rosea*: *V. longifolia rosea*, *V. spicata rosea* or *V. pectinata rosea*.

— *rupestris*; a form of *V. Teucrium*.

— *speciosa*.

— *spicata*.

— *spuria*.

— *subsessilis*: **V. longifolia subsessilis*.

— *Teucrium*.

— *Traversii*.

— *verbenacea*: unknown botanically.

— *virginica*.

VERSCHAFFELTIA. *V. splendida*.

VIBURNUM. **V. acerifolium*.

— *alnifolium*.

— *americanum* (American High-bush Cranberry).

— *Carlesii*.

— *cassinoides*.

— *dentatum*.

— *dilatatum*.

— *ellipticum*.

— *japonicum*.

VIBURNUM, continued.

— **Lantana*.

— *lantanoides*: **V. alnifolium*.

— **Lentago*.

— **macrocephalum*.

— *macrophyllum*: **V. japonicum*.

— **molle*; often misapplied to *V. venosum* and *V. venosum Canbyi*.

— **nudum*.

— **odoratissimum*.

— **Opulus* (European High-bush Cranberry).

— *Oxyccus*: **V. americanum*, but sometimes misapplied to *V. Opulus*.

— *placatum*: *V. tomentosum plenum*: **V. tomentosum platum*.

— **prunifolium*.

— **pubescens*.

— *pyrifolium*: **V. prunifolium*.

— **rhytidophyllum*.

— **rufidulum*.

— *Sandankwa*: **V. suspensum*.

— **Sieboldii*.

— *sterile*: may be *V. macrocephalum sterile* or *V. Opulus sterile*.

— **suspensum*.

— **Tinus*.

— **tomentosum*.

— **utile*.

— **venosum*.

— **Wrightii*.

VICIA. *V. Faba* (Broad or Windsor Bean).

— *Gerardii*: *V. cracca Gerardii*.

— *oroboides* (*Orobus lathyroides*).

— *sativa* (Spring Vetch).

— *villosa* (Hairy Vetch).

VICTORIA. *V. regia*.

— *Trickeri*: *V. Cruziana*.

VIGNA. *V. Catjang*.

— *sesquipedalis* (*Asparagus Bean*).

— *sinensis* (Cowpea).

VINCA. *V. alba*: **V. minor alba*.

— *argentea*: **V. minor argentea*.

— *aurea*: **V. minor aurea*.

— *cærulea*: **V. minor cærulea*.

— *elegantissima*: applied either to *V. major elegantissima* or a form of *V. minor*.

— *herbacea*.

— **major*.

— **minor*.

— *purpurea*: **V. minor purpurea*.

— *rosea*.

VINCETOXICUM. *V. acuminatum*:

Cynanchum acuminatifolium.

— *japonicum*: *C. acuminatifolium*.

VIOLA. *V. admirabilis*: *V. cornuta admirabilis*.

— *blanda*.

— *californica*: *V. odorata*.

— *canina*: probably *V. conspersa*; *V. canina* is a European species and not now recognized as occurring natively in any form in North America.

— *cornuta*.

— *cucullata*; the stock in trade, however, is probably *V. palmata*.

— *lutea*.

— *odorata*.

— *palmata*.

VIOLA, continued.

— *Papilio*: *V. cornuta Papilio*.

— *pedata*.

— *pedunculata*.

— *Priceana*.

— *pubescens*.

— *rotundifolia*.

— *septentrionalis*.

— *tricolor*.

VIRGILIA. *V. lutea*: **Cladrastis lutea*.

VISCARIA. *V. elegans*: *Lychnis Viscaria elegans*.

— *oculata*: *L. Coeli-rosea oculata*.

VITEX. **V. Agnus-castus*.

— *incisa*: **V. Negundo incisa*.

— **Negundo*.

VITIS (see *Ampelopsis*, *Cissus*, *Parthenocissus*). *V. aconitifolia*: **Ampelopsis aconitifolia*.

— **æstivalis*.

— **amurensis*.

— **Berlandieri*.

— **bicolor*.

— *Bourquiniana*: **V. æstivalis Bourquiniana*.

— *brevipedunculata*: **A. heterophylla amurensis*.

— **californica*.

— **candicans*.

— *capensis*: **Cissus capensis* (page 3482).

— **Champinii*.

— **cinerea*.

— **Coignetiae*.

— *cordata*: **A. cordata*.

— **cordifolia*.

— *discolor*: **C. discolor*.

— **Doaniana*.

— **Girdiana*.

— *Henryana*: *Parthenocissus Henryana*: **A. Henryana*.

— *heterophylla*: **A. heterophylla*.

— *humulifolia*: **A. humulifolia*.

— *hypoglauca*: **A. hypoglauca* (page 3483).

— **Labrusca*.

— **Linsecomii*.

— **Longii*.

— *megalophylla*: **A. megalophylla*.

— *oblonga*: **C. oblonga* (page 3483).

— *quadrangularis*: **C. quadrangularis* (page 3482).

— *rhombifolia*: **C. rhombifolia* (page 3483).

— *riparia*: **V. vulpina*.

— **rotundifolia*.

— **rubra*.

— **rupestris*.

— *striata*: **C. striata*.

— *Thomsonii*: *P. Thomsonii*: **A. Thomsonii*.

— **vinifera*.

— **vulpina*.

VITTADINIA. *V. triloba* (*Erigeron mucronatus*).

VOLUTARELLA. *V. muricata* (*Ambrosia*).

WAHLENBERGIA. *W. grandiflora*: *Platycodon grandiflorum*.

— *vinæflora*: *W. gracilis*.

WALDSTEINIA. *W. fragarioides*.

WASHINGTONIA. *W. filifera* (*Brahea*).

WASHINGTONIA, continued.

- *gracilis*.
- *robusta*: *W. filifera robusta* (Brahea).
- *Sonoræ*.

WATSONIA. *W. Ardernei*: *W. viridifolia* O'Brienii.

WEIGELA (if the American and East Asian species are considered to be con-generic, the name becomes *Diervilla*, and this is the usual disposition; the name *Weigela*, however, is well established in horticultural practice).

- **amabilis*: *Diervilla florida*, or perhaps sometimes *D. coræensis*.
- **arborea*: *D. coræensis arborea*.
- **candida*: *D. hybrida candida*.
- **Desboisii*: *D. hybrida Desboisii*.
- *florida*: *D. florida*: **W. rosea*.
- **floribunda*: *D. floribunda*.
- **Grænewegenii*: *D. hybrida Grænewegenii*.
- **Hendersonii*: *D. hybrida Hendersonii*.
- **hortensis*: *D. japonica hortensis*.
- **hybrida*: *D. hybrida*.
- **japonica*: *D. japonica*.
- **Kosteriana*: *D. hybrida Kosteriana variegata*.
- **Lavallei*: *D. hybrida Lavallei*.
- **nana*: *D. hybrida nana variegata*.
- **rosea*: *D. florida*.
- **sessilifolia*: **D. sessilifolia*.
- **Steltzneri*: *D. hybrida Steltzneri*.
- **Van Houttei*: *D. hybrida Var Houttei*.
- **venosa*: *D. hybrida venosa*.
- **Verschaffeltii*: *D. hybrida Verschaffeltii*.

WELLINGTONIA. *W. gigantea*: **Sequoia gigantea*.

WHITLAVIA. *W. gloxiniioides*:

- Phacelia Whitlavia gloxiniioides*.
- *grandiflora*: *P. Whitlavia*.
- WIGANDIA. *W. caracasana*.
- *imperialis*.
- *macrophylla*: *W. caracasana macrophylla*.
- *Vigieri*.

WISTERIA. *W. brachybotrys*: **W. floribunda*.

- *brachybotrys alba*: **W. venusta*.
- *chinensis*: **W. sinensis*.
- *floribunda*.
- **frutescens*: **W. frutescens magnifica*.
- **multijuga*: *W. floribunda macrobotrys*.
- **sinensis*; but often it is *W. floribunda*.
- *speciosa*: **W. frutescens*.
- **venusta*.

WOODSIA. *W. ilvensis*.

— *obtusa*.

WOODWARDIA. *W. angustifolia*: *W. areolata virginica*.

XANTHISMA. *X. texanum* (Centauridium).

XANTHOCERAS. **X. sorbifolia*.

XANTHORRHIZA. *X. apiifolia*: **Zanthorhiza apiifolia*.

XANTHOSOMA. *X. Lindenii* (Phyllotanium).

XANTHOXYLUM. See *Zanthoxylum*.

XERANTHEMUM. *X. annuum*.

XOLISMA. *X. ligustrina*: **Lyonia ligustrina*.

YUCCA. **Y. aloifolia*.

— *angustifolia*: **Y. glauca*.

— **baccata*.

— **filamentosa*.

— **flaccida*.

— **glauca*.

— **gloriosa*.

— **Treculeana*.

— *Whipplei*: **Hesperoyucca Whipplei*.

ZALUZIANSKYA. *Z. capensis* (Nycoterinia).

ZANTEDESCHIA (Richardia. Florists' Calla). *Z. æthiopica*.

— *albo-maculata*.

— *Elliotiana*.

ZANTHORHIZA. **Z. apiifolia* (Xanthorrhiza).

ZANTHOXYLUM. **Z. americanum*. — **piperitum*.

ZEAL. *Z. japonica*: *Z. Mays japonica*.

— *Mays* (Maize. Indian Corn).

ZEBRINA. *Z. pendula* (Tradescantia).

ZELKOVA. *Z. acuminata*: **Z. serrata*.

ZENOBIA. **Z. pulverulenta* (Andromeda).

ZEPHYRANTHES. *Z. alba*.

— *Atamasco* (Amaryllis).

— *candida*.

— *rosea*.

ZINGIBER: *Z. officinale* (Ginger).

ZINNIA. *Z. elegans*.

— *Haageana*.

ZIZANIA. *Z. aquatica*: *Z. palustris*.

ZIZYPHUS. **Z. Jujuba*.

ZYGOCACTUS. *Z. truncatus* (Epiphyllum).

INDEX

To synonyms, vernacular names, and miscellaneous references, not in alphabetic order in the Cyclopedia

The check mark (x) indicates that the entry is in the second column of the given page. Unchecked entries are in the first column.

Vol. I comprises pages 1-602; II, pages 603-1200; III, pages 1201-1760; IV, pages 1761-2422; V, pages 2423-3041; VI, pages 3043-3639.
